THE ARCHITECT AND CONTRACT REPORTER. A JOURNAL OF ART, CIVIL ENGINEERING & BUILDING.

THE WEEK.

THE majority of exhibitors at the Paris International Exhibition were not, we believe, successful in attracting orders, but the administrators of the Government pottery work of Sèvres can be congratulated on their success. They calculate on receiving about 20,000*l.*, a sum which is sufficiently large to convince amateurs that, in spite of opposition from so many quarters, the artistic beauty of Sèvres can still command admirers. Between 400 and 500 pieces were exhibited, and not only were they all sold, but replicas of every one of them were ordered. In one case, the *Phryne* by M. RIVIÈRE, no less than 276 examples have to be prepared. A piece by M. LEONARD must be reproduced 150 times. Some very costly works have been sold a dozen times, but the average of all is about twenty. This is a satisfactory result, for whatever changes may occur in France, the Sèvres standard has been always maintained, although purchasers grumble about the time required to execute their orders.

THE Corporation of Aberdeen have entered into arrangements which will put an end to the litigation with the University Court of Aberdeen, but which will not save the old parish church of Greyfriars, which was the main cause of the dispute. In return for University land, which will be used for the widening of Broad Street, the Corporation will surrender property in order to provide an open space in front of University Buildings. Within two years the Corporation are also to erect a new church in substitution for the existing church. The new church is to have accommodation for not less than 800 sittings, and is to be erected and fitted up according to plans and specifications to be prepared by an architect employed by the Corporation and approved of by the Presbytery and kirk session. The Corporation will remove at their own expense the existing church of Greyfriars, and shall be entitled to use in the erection of the new church any of the old materials which may be suitable. Should the old church become unfitted for public worship before the new church is ready the University Court will allow the Mitchell Hall to be used as a substitute. The University Court undertake to employ all means in their power to raise funds for the completion of the university extension scheme.

If English art does not become familiar to Frenchmen and wherever *L'Art* finds an entrance it will not be the fault of the conductor, M. PAUL LEROI. In the number for July he has introduced an etching by M. LALOUZE of REYNOLDS'S *Lady Cockburn and Children*. There is also an illustration of Mr. GOSCOMBE JOHN'S statue of the late Duke of DEVONSHIRE, which is described as a "fort belle statue, d'un arrangement parfait, d'un goût rare et d'une exécution irréprochable dans toutes ses parties." Finally, it is said that it is stamped with character, and that the honour paid to it in the Salon of a first medal was inevitable. The principal illustration, however, is the lithograph *Le Pont de Grez*, after COROT, by M. THÉOPHILE CHAUVEL, the art director of *L'Art*. M. CHAUVEL is not only an *étcher*, but also the honorary president of the French

society of aquafortists. In this case he proves himself to be one of the most delicate of lithographers, and he has admirably translated the peculiar charm which belongs to COROT'S best works.

IN America the waterworks companies are suffering loss through the electrolysis which is caused by the tramway cars. The English Parliament would therefore be justified to insist on measures which would prevent a like injury occurring in London and provincial towns. At the recent convention of the American Waterworks Association in New York the following resolutions were adopted:—"That the American Waterworks Association, as a national organisation, herewith unanimously maintains that street railways have no right to so operate their cars as to cause injury and destruction to water-pipes." "That street railways now operating under the single-trolley system ought to be required to remove their return current from the ground, and that if they continue to operate by current transmitted from the power station to motors on the cars they should be required to provide a complete metallic circuit of sufficient capacity to convey all the current, and in a manner to absolutely insulate it from the rails and from the earth." In several cases there has been litigation on the subject, and although there was no doubt about the extent of the damage, the Courts did not always decide against the tramway companies.

ONE of the latest services which Germany has rendered to Greece consists in the production of two maps of Attica of the most scrupulous accuracy. The survey was made by officers of the Royal Prussian General Staff, at the request of the German Archæological Institute in Athens. The whole undertaking has occupied about a quarter of a century. The larger of the two maps is on a scale of $\frac{1}{25000}$. There are twenty-four sheets. Care has been taken to introduce on the map all the remains of Grecian antiquity. The second map is on the scale of $\frac{1}{100000}$. All the sheets have been executed with German thoroughness, and will be invaluable in public libraries throughout the world. Besides the map the German Institute in Athens will produce a collection of the reliefs on monuments in Attica, as well as complete copies of inscriptions. By these works Germany has again demonstrated its claim to be regarded as the best upholder of Greek archæology.

AN exhibition has just been held in the School of Industrial Art, Geneva, which would delight all those who wish to see natural objects employed as a basis for decoration. It consisted of a series of casts taken from fruits, flowers and vegetables. During many months in the year those objects are not obtainable, and as substitutes for them casts have been prepared. The operations were difficult, and required dexterity as well as patience, but the results are most successful. Flowers, thistles, bunches of grapes, stems of plants, branches, &c., have been reproduced with fidelity. The casts will be of the utmost use to ornamentists, and the School of Geneva is to be congratulated on experiments which will render invaluable service to artists.

CHICHESTER CATHEDRAL.*

WHEN England was conquered by the Normans the country was divided into fifteen dioceses, viz. Canterbury, York, London, Winchester, Chichester, Rochester, Salisbury, Bath and Wells, Exeter, Worcester, Hereford, Coventry and Lichfield, Lincoln, Norwich and Durham. The majority of them, it will be observed, were connected with cities which had been Roman settlements. A number of circumstances had combined to determine the selection in early Saxon times of the places which were best adapted for episcopal seats, and among them were the associations which belonged to the dominion of Rome. WILLIAM THE CONQUEROR was too able a ruler to be indifferent to the value which arose from the connection with the old imperialism, and he was careful to allow the ecclesiastical divisions to remain as he found them. HENRY I. introduced some changes, but they were not of a revolutionary character. One was the creation of the diocese of Ely in order to gratify Abbot HERVEY, who wished to be independent of the Bishop of Lincoln; the other was the formation of the diocese of Carlisle out of parts of Cumberland and Westmoreland, a district in which episcopal control was somewhat indefinite.

In the second place, it is to be remarked that in some instances there was no rigid rule observed in England respecting the retention of the bishop's chair in the place originally assigned as the centre of authority. REMIGIUS was the first to determine that Lincoln should be the episcopal residence, for previously the cathedral was to be found in Dorchester. Sidnaster and Leicester also possessed cathedrals, which were superseded by Lincoln. Before Norwich was selected there were cathedrals for the diocese in Dunwich, Elmham and Thetford. Exeter was not recognised as a cathedral city until the reign of EDWARD THE CONFESSOR. The bishop encountered dangers in travelling between Crediton in Devonshire and St. Germans in Cornwall, the sites of the two cathedrals. As Exeter was a fortified city he preferred it as being more secure, and in 1046 he took possession of St. Peter's Church. The great northern diocese, now known as Durham, was ruled from Lindisfarne for two centuries and a half, and from Chester-le-Street for a century and a half. Chester and then Coventry for a time superseded Lichfield as cathedral cities. Old Sarum supplanted Sherborne, and in turn yielded its supremacy to Salisbury.

The removal of the cathedral of the kingdom of the South Saxons from Selsey to Chichester in 1082 was, therefore, warranted by precedents, and there was, moreover, a change from a fishing village to a town which had been an influential Roman station. In a historical sense Selsey was, however, of importance. When St. WILFRID was deprived of the Archbishopric of York, and was banished in 680, he was compelled to become a wanderer. At length he found a refuge with ÆTHELWOLD or ÆTHELWEALH, the king of the South Saxons, who dwelt at Selsey, surrounded by people who were wreckers rather than fishermen. WILFRID instructed them in making nets, and in that way earned their gratitude. He used his influence over them to obtain aid in building a church which became a cathedral, for, under the circumstances, there could be no opposition to the Archbishop of York constituting himself a Sussex bishop. From the king and his successor, CEADWALLA, he obtained large grants of land. But let no one believe the transaction was carried out in the ridiculous manner represented by a pseudo-German painting on a screen of the transept of Chichester cathedral.

We have nothing remaining to suggest the character of WILFRID's cathedral or of its successors, for we cannot suppose that during four centuries one building could have survived in a district which was liable to invasions by northern rovers. Even the site is doubtful. According to the song, the fisherman on Lough Neagh's banks sees the round towers of former days in the waves beneath him shining, but at Selsey there is no vision of that kind. A part of the sea is still known as the Bishop's Park, and a part of the shore as the Bishop's Copse, but the names are enough to signify the absence of stones. In the graveyard fragments of masonry are found, which probably formed

a part of old buildings, but whether of a church or a monastery has not been ascertained. In the cathedral of Chichester are a few sculptured slabs which are assumed to have been derived from Selsey, and in style they are pre-Norman. They are the only relics of the primitive cathedral to which any importance can be attached.

After the Conquest, STIGAND, who was one of the numerous chaplains of WILLIAM I., obtained the bishopric of Selsey. Whether he was the first to suggest the removal of the see to Chichester, or what were the reasons which led to the change are unknown. It is certain, however, that at a council held in London in 1075 it was decided to substitute Old Sarum for Sherborne, Chester for Lichfield, and Chichester for Selsey. In Chichester a church dedicated to St. PETER and belonging to a nunnery was, it is said, first utilised as a cathedral, until on the site a new building could be raised. But there is no evidence that STIGAND took any part in the erection of a cathedral. He died in 1087, and as he was involved in disputes about his privileges with WILLIAM I. and Archbishop LANFRANC, STIGAND may have been worried enough without undertaking the cares of building.

In 1091 RALPH LUFFA was appointed to the see. By 1108 he had a cathedral erected, but seven years afterwards it suffered much from a fire. Whether a new building became necessary is uncertain, but it is supposed that owing to the generosity of HENRY I. a long period did not elapse before there was a cathedral in which services could be held. Much of the existing building is to be credited to Bishop RALPH. Sussex at the time could not be considered as prosperous, and the severity of the style at Chichester was no doubt owing to the difficulty of obtaining money to pay for ornament in any form. The nave and triforium are as severely plain as any to be found in England. Although the aisles are doubled, two being found on each side of the nave, yet from the plainness of the treatment the interior appears to be less in area than is suggested by the exterior. When seen from the west entrance the cathedral seems to be one of the smallest of its class. The transepts, from their position, do not aid in increasing the effect, and it must be allowed that the interior as a whole is disappointing.

After standing for about sixty years, RALPH's church was nearly all destroyed by a fire in 1187, during the episcopate of the second SEFFRID. It was necessary to reconstruct the clerestory, and the introduction of the pointed arch in the side arches shows the development which had taken place in architectural style. An important change is also to be seen in the stone vaulting of the nave, which necessitated the erection of buttresses on the exterior. The presbytery had to be constructed, and in the triforium and clerestory of this part of the building the pointed arch was used. The three chapels which formed the termination of Bishop RALPH's building were removed and transeptal chapels were built instead. SIMON of Wells, the successor of SEFFRID, also carried on the alterations, and to those ecclesiastics are to be attributed the deviations from the original Norman work of Bishop RALPH.

It is believed that parts of the Norman church were a low central tower and two western towers. There is a record of the fall of two towers in Chichester in 1210, and it has been assumed that they must have belonged to the cathedral. RALPH NEVILLE, the chancellor, was bishop from 1224 to 1244, and took great interest in its restoration. He bequeathed money for the finishing of a stone tower which may have been the central tower. There were several chantry chapels added in the thirteenth century, but they no longer exist, for by removing the divisions between them they became the outer aisles, which are a peculiarity of the cathedral. The lady chapel was erected between 1288 and 1305 by Bishop GILBERT, and although it sometimes is only used for storing benches it is simple and refined in style. At one time it was utilised as the cathedral library. So little is known about the original purpose of the chapel, there are clergymen's wives in Sussex who believe it was set apart for their special use as a feminine chapter-house. JOHN OF LANGTON, who was elected in 1305, completed the presbytery and south transept. The history of the detached bell-tower, which is unique in England, is a blank, for we cannot tell under what circumstances it was created or by whom it was designed. At the

* See Illustration.

present time its decayed condition is in marked contrast with the new work of the cathedral.

For many a year the history of the cathedral was uneventful. But on two occasions the building suffered to a remarkable extent. In December, 1642, Chichester sustained a siege against the Parliamentary army. On its surrender the soldiers at once went to the cathedral. After a thanksgiving for their victory, we are told by Dean RYVES how they "ran up and down the church with their swords drawn, defacing the monuments, hacking and hewing the seats and stalls, scratching and scraping the painted walls, Sir W. WALLER and the rest of the commanders standing by as spectators and approvers of these impious barbarities."

Another disaster occurred forty years ago. The ground at Chichester is not adapted for sustaining great weights unless special precautions are taken. The central tower and spire for many years caused anxiety through settlements. In the eighteenth century large sums were expended on repairs. A legacy of Dean CHANDLER in 1859 for the restoration of the choir was the cause of an unexpected catastrophe. It was the means of revealing the occasional weakness of Mediæval masonry. The oratory of Bishop ARUNDEL, which was placed between the nave and choir, was bounded on the west side by an elaborate screen which supported the organ. In the course of the restoration the screen was removed. It was then found that the piers supporting the tower, which the screen served to stay or shore, were formed of a core of loose rubble cased with ashlar. As if to increase the weakness, the bases had been cut away to make room for the stalls and organ stairs. In spite of the efforts of the architect, Sir GILBERT SCOTT, and the builders, it became evident that the danger increased from day to day. Finally warning had to be given to the inhabitants who lived near the cathedral. On February 21, 1861, the spire descended, crushing through all obstacles, and eventually broke into fragments. No time was lost in meeting the disaster. Six years afterwards a successor to the vanished structure was raised at a cost of 60,000*l.*—an evidence of enthusiasm which could hardly be surpassed in Mediæval times.

THE VALUATION OF PROPERTY.*

THE influence of the Government valuation system on the modern history of Ireland has not been sufficiently considered. When RICHARD GRIFFITH, the Welsh civil engineer and geologist, was first given a commission to value Irish lands, all that was intended was to bring some unity into the assessment for taxation, which hitherto had been arrived at in a haphazard way. GRIFFITH was not satisfied with taking counties, baronies or parishes in bulk. He did not believe there would be a sufficient basis for any general calculations until he had settled the value of every field. He devised instructions for his assistants which form a very remarkable document. As a geologist he insisted on a description of all the varieties of soils. The worth of arable land would, of course, depend upon its productiveness, and he prepared a schedule of prices which were to be used when calculating the value of the corn or potatoes which were grown. Subsequently the principle of the survey was extended in order that the valuation of every farm and tenement should be ascertained.

The returns, of which copies could be obtained at a cheap rate, were not long in circulation without producing an effect that was almost revolutionary. The old method by which the agents of needy landlords exacted disproportionate rents from tenants at will, or, as KOHL, the German traveller, called them, "chasable tenants," appeared more unjust when tested by the amounts which had been ascertained by impartial official valuers. For the first time a general standard of value was furnished, and by its aid the Irish farmers were able to discover the exact degree of excess which they were compelled to pay. All the changes in the law of landlord and tenant in Ireland which have occurred during the last half century can be traced to the influence of GRIFFITH'S valuation. The rates of produce have been altered from time to time, but there has been

no important alteration in the principle, and land is now held under conditions which would be amazing to the old race of proprietors and occupiers. The effects produced in Ireland testify to the importance of the valuer as an agent in sociology.

It has been often said that a similar system should be introduced into England, and all who are acquainted with the agricultural classes are aware of the complaints which are constantly made about the disproportionate rents which have to be paid for land. The conditions of tenure adopted in England are unlike those which prevailed in Ireland, and which Parliament has been so often obliged to amend. In England the ownership of land has been accepted as a privilege, and in consequence a smaller return on outlay is expected than has to be forthcoming in trade. In Ireland the landlords depended for their income on land alone, and the squeezing of tenants was necessary, regardless of the injustice. "We were real gentlemen to the backbone," says one of LEVER'S characters, "and there was not one of the name for five generations that could earn sixpence if he were starving." With such potentates it mattered little what was left to a tenant, for his mission in life was to uphold the landlord in luxury.

The English system of placing business on an equitable basis is seen in every page of the "Hints to Young Valuers." The book comprises instructions for dealing with the varieties of property which generally come under the investigation of valuers, but although it contains over a thousand pages there is no advice in it which would be unworthy of a gentleman to follow. In the chapter on "Dilapidations" we find Mr. CRAGG saying:—"An over-zealous surveyor is sometimes tempted to strain unduly a tenant's liability for repair, especially with regard to hidden portions of the buildings, such as joists for example, but by such a course of conduct a surveyor generally does his client more harm than good." That sentence is sufficient to indicate the spirit which inspires the book. The author wishes to have dealings with farmers and others who possess a practical knowledge of what they propose to undertake, for there can be no victory in overcoming a man who is a greenhorn without suspicion. It is also pointed out how considerate landlords can let farms at their full market value, whereas those who think only of revenue and are always ready to distrain for rent, find fewer intending tenants. It is suggested that in the latter case from 5 to 10 per cent. should be deducted from the valuation "to cover the tenant's liability in case of contingencies which even arise under a good landlord." The desire for fair play and honest dealing on all sides is not the least important of the "hints."

It is not to be supposed that so large a volume is made up of platitudes which, although interesting, do not meet a tyro's difficulties. Mr. CRAGG says it is quite impossible to frame any fixed set of rules capable of application to the computation of the worth of any given property under all circumstances; but by giving details of the cost of agricultural operations and of the produce which may be assumed, as near an approximation is obtained as can be derived from books. In valuing property practice is the best teacher, and in consequence many valuers become farmers, in the same spirit that compels engineers to make experiments on materials. It is difficult by a passage to suggest the character of the instructions given in the pages, but the following remarks about the examination of roofing may be taken as a sample:—

If it is true—that is, if the surface be uniform—the roofing timbers are doubtless good; if "sagged," they are weak; if sunk at distinct points, decayed. The condition of the slates or tiles is also an important matter, because defects in these details will, by admitting wet, soon convert a good sound building into a bad one. Slates or tiles which show signs of decay must be noted for renewal. The laths or battens must be looked to. If they are defective or weak, the horizontal lines of the roof will be crooked. If there are evidences of much patching, the probabilities are the nails are bad. The pointing or "flashing" round the chimneys, or where the roof abuts against a wall, is often, like ironmongery, an index of the general character of the construction of the building. Good finish in these matters is rarely met with in an inferior erection. Without entering into a more lengthy description, I may say generally that when such details are substantially carried out we shall invariably find a good sound building; but when

* *Hints to Young Valuers*: a Practical Treatise on the Valuation of Property. By A. R. Cragg, F.G.S. With explanations of the legal principles involved by J. R. V. Marchant, M.A. Second edition. London: The Land Agents' Record, Ltd.

shoddy fittings and zinc flashings are used we ought to be very suspicious of the rest. Sometimes the materials may be proper but the execution is unworkmanlike. For instance, the durability of gutters, valleys, or flats depends in a great measure upon the execution of the work. If lead is laid in too long lengths (over 10 feet) the action of the sun causes it to warp and crack, especially if the lead is too light. In many recently built professedly good houses it is not uncommon to find 3 or 4 lb. lead (per foot square) used in valleys, &c., and such work soon becomes a constant source of expense and annoyance.

The subject of dilapidations is considered at length, and is brought down to the recent *DE FALBE* case, which related to the removal of tapestries which were supposed to have been fixtures, and therefore to have belonged to the estate. Custom has led people to suppose that a valuator's business is mainly with land, but Mr. CRAGG in his work deals not only with land, but with town properties. A young architect, therefore, although he may not be called in to examine farms or market-gardens, will find much relating to his own profession which will repay a study of the book. The remarks on town properties might have come from a house agent of long experience. For example, it is not everyone who is aware that in London "a good position for a fishmonger's shop is in the immediate neighbourhood of a large railway station, where there is a good deal of suburban traffic." It is not only in established streets there is an opportunity for the exercise of valuation; building land also deserves special attention. It is pointed out that a desirable building site is not every elevated spot, but land which is affected by the two causes, necessity and desire. The eagerness to obtain a high price for ground that is of little importance diminishes the chance of finding purchasers for it. Mr. CRAGG says:—

The value of many estates is greatly injured by the method of putting them on the market. A large area of land is repeatedly exposed for sale before there is a real demand for it, and all sorts of expedients are resorted to in the endeavour to dispose of a portion. The speculative builder is introduced, and probably financed, and badly-built houses are the result. There are many building estates on the outskirts of London and elsewhere which have been thus permanently injured. Instead of thrusting land upon the market, and permitting any description of building to be put upon it in order that it may become covered, it is more judicious to offer only a limited area—according to the demand—at a time, and to insist upon a good class of houses being erected at the commencement. This encourages desirable tenants and gives a character to the estate, the growth of which may at first be more slow, but its development will be upon a sounder basis.

The valuer has sometimes to examine artificers' work, and he should therefore be acquainted with the quantity surveyor's methods. The system recommended by the Manchester Society of Architects for quantities and measuring-up is described according to the revised form of 1886. Every variety of surveyor's work comes within the compass of Mr. CRAGG's comprehensive treatise. Throughout he has kept in view that he is instructing young valuers, and accordingly enters at more length into the different subjects than is usual in professional books. The pages are clearly written, and the author's meaning is not likely to be misunderstood by novices. The book supplies a void in technical literature, and can be recommended as an excellent guide to the profitable business of valuation.

ROMAN ART IN COLCHESTER.

IN October 1845 the three bronzes shown in the illustrations were discovered during the excavations of the line of railway between Colchester and Ipswich, about a mile to the east of the Colchester terminus, and half a mile north of the town. They were dug up at the depth of about 5 feet from the surface. Portions of red pottery, bronze and lead were found near them, and, at the distance of about 6 feet, a human skull and some horses' teeth. The spot presented no indications of having been a place of dwelling or of sepulture, but 200 or 300 yards nearer the terminus is a small rising ground, in cutting through which the railway labourers are said to have found urns containing bones.

The larger of the two heads, according to the late Sir Charles Newton, has evidently ornamented a vase, the loop with which it is surmounted having formed the place of inser-

tion of a handle attached like that of a bucket. The type which this bronze presents is a peculiar one. The beard falls in parallel spirals, the ears are pointed, the under lip is full and sensual; the hair is bound with an ivy-wreath, from which, behind each ear, hangs a bunch of grapes; the hair is parted over the forehead. In the countenance there is something of majestic gravity, but the surface of the features has suffered so much injury that it is not certain whether the expression they now convey is that intended in the original design. The general cast of the features, the sensual overhanging under lip, the furrowed beard, the pointed ears, are characteristic of Silenus; but the low forehead, and the hair parted in front of the wreath, seem hardly reconcilable with any known type of this deity. It is possible that the bronze represents Priapus, whose statue in the Museo Pio-Clementino has the hair similarly arranged, and of whom both the ivy and vine-wreath were attributes; or again, we may have here one of those combinations of the Bacchic and Satyric types which were not unfrequent in ancient mythology, particularly in the latter days of paganism.

In this fragment we still discern the excellence of the art, notwithstanding the great decay of the original surface. In the design the characteristic and the beautiful are singularly and happily contrasted. The grotesque expression of the features does not disturb the general harmony of the composition; the flowing lines of the hair are skilfully contrasted with the sharp, well-defined forms of the leaves, and the different surfaces are wrought with great knowledge, and judiciously relieved by undercutting. On one side of the beard the edge of the metal has the shape of a vine leaf, but this may be nothing but the accident of fracture. In the collection of antiquities at Corsham House, Wilts, is a bronze head of Bacchus, very similar in the general character of the composition, and apparently of the same period of art, and which probably has also formed the ornament of a vase. It was formerly in the collection of Dr. Mead, and is now the property of Lord Methuen.

Another head engraved is that of the Emperor Caligula. The portrait is a good example of the skill of the ancient artist in what may be called ethography, or the delineation of character, and completely embodies the idea which we have formed from history of the disposition and habits of mind of this emperor. The contracted brow and sinister gaze express his implacable cruelty; in the careworn hollowness of the cheeks and eyes we may trace the workings of those vague terrors with which the mind of this tyrant was ever haunted. The lips and corners of the mouth are pinched and drawn in, as if trained to conceal emotion—a sign of long and early habits of dissimulation such as Caligula was compelled to practise in his youth in order to elude the suspicions of Tiberius.

It is interesting to observe how nearly this portrait corresponds with the description of the personal appearance of this emperor handed down to us by Roman writers of his period. They remark that his eyes were fixed and sunk in his head, his temples hollow, his brow stern and lowering, and Suetonius relates that he enhanced the natural hatefulness of his aspect by studying before a mirror how to give his features the most cruel and forbidding expression. This head is modelled with great care and knowledge, and from the rarity of statues and busts of Caligula is very valuable as presenting so finished a portrait. It bears a most striking resemblance to a bronze head engraved in the "*Recueil des Antiquités*" of Caylus, and wrongly attributed to Claudius in that work. Under the bust is placed a globe, a well-known symbol of Roman sovereignty variously combined and associated in their art. On a copper coin struck at Romula Bætica, in Spain, the bust of the Empress Livia occurs so placed, and analogously on a silver coin struck at Antioch the bust of Trajan rests on the imperial eagle, and other coins of early emperors may be cited in illustration.

This bust was probably mounted on the small bronze stand found lying near it, the surface of which is inlaid with a floral ornament in silver. The celebrated bronze Mercury from the collection of Mr. R. P. Knight, now in the British Museum, and many of the bronzes found at Pompeii are placed on stands similarly ornamented; indeed, this species of inlaying formed the usual decoration of the candelabra and other bronze ornaments of the Romans.

There seems every reason for supposing that Colchester occupies the site of the Roman colony founded at Camulodunum in the reign of Claudius, destroyed by the Britons in their insurrection in the time of Nero, but probably soon recovered and permanently occupied by the conquerors. We may presume that the bronzes described in this paper were brought from Italy by the Romans shortly after their first settlement in this station. Very extensive Roman remains have, as is well known, been found at Colchester; and here, as elsewhere, we are enabled to estimate the permanence of the settlement and the wealth and luxury of the inhabitants by the abundance of their coins, tessellated pavements and archi-

BRONZES FOUND IN COLCHESTER IN 1844-45.

tectural materials. The bronzes here described furnish new and important evidence of this nature, and, distinguished by the beauty of the art from almost all the works of Roman times hitherto discovered in this country, are tokens of a degree of social refinement beyond the general standard of civilisation in the remote and half-reclaimed province of Roman Britain.

The small bronze figure of Jupiter Conservator was discovered in 1844 at Colchester. The attitude of this bronze is simple and dignified; the pallium, thrown gracefully over the shoulders, hangs over the left arm, the hand of which doubtless held a sceptre; in the right hand is the thunderbolt. The head is designed and treated with the grandeur of manner which the type requires, but the lower limbs are coarse, and the modelling exhibits none of the refinement observable in the treatment of the two bronzes we have described. The cavities which represent the circles of the eyes were, we must suppose, originally filled with silver. This statue was probably executed during the best period of Roman art, some time between the reigns of Augustus and Marcus Aurelius. The type of this deity, inscribed Jovi Conservatori, is a very frequent one on Roman imperial coins.

ST. PATRICK'S CATHEDRAL, DUBLIN.

THE following letter has been sent by Sir Thomas Drew, president of the Royal Hibernian Academy, to the Dean of St. Patrick's:—

St. Patrick's Cathedral: June 24, 1901.

Dear Mr. Dean,—In your absence I have the pleasure to report to you perhaps the most interesting of the successive archaeological discoveries which seem to have followed each other at St. Patrick's during your time, and in my connection with it in twelve years, viz. the finding of the undoubted site and record of the Ancient Well of St. Patrick, from which this most ancient church's foundation had its origin. It occurred on June 18, and by the vigilance of Mr. Spencer Harty, the city surveyor.

It is, of course, matter of general knowledge that the present cathedral of St. Patrick is a great Anglo-Norman church, which in the thirteenth century superseded and occupied the site of a still more ancient church of Irish foundation—of St. Patrick in Insula. This more ancient church owed its origin in the low-lying valley of the Coombe to the existence of a venerated Well of St. Patrick, at which the great missionary saint was reputed to have baptized converts. In centuries succeeding the thirteenth native Irish and pilgrims from distant lands are recorded to have not ceased to visit and venerate the well; but under the rule of the Anglo-Norman ecclesiastics, who do not appear to have held enthusiastically in honour a mere Irish saint, the well seems to have fallen into neglect, and finally to have disappeared since the end of the sixteenth century.

It is a strange incident of survival of history that passing and quite disconnected records by three or four writers in different ages should have happened to present themselves to me about the same time some years ago, and to supplement each other so remarkably as to point out the exact situation of the lost well.

First came Archbishop Ussher, who seems to have been among the last to see the well itself about 1590. He said:—"In the enclosure of the church of St. Patrick, not far from the tower, we have seen that Fount of St. Patrick at which Dublin neophytes were baptized, lately enclosed among houses and choked up."

A previous writer, Andowé, in 1509, described the well as "near the house of the Prebendary of Howth."

Dr. John Lyon, the famous antiquary, treasurer of St. Patrick's, and compiler of the "Novum Registrum" of Christ Church in the eighteenth century, who lived his long life a resident of his own proper manse in the precincts of St. Patrick's Cathedral, quotes from an ancient record that the well was "in the outer court of the Archdeacon of Glendaloch's Cloister."

Latest of all, Malton, the illustrator of "Dublin Architecture" in 1795, described with his published view of the west front of St. Patrick's how the site of the well "was under the hall of the house seen beyond the ruin" in his view.

You will remember the recovery about eleven years ago of ancient survey maps of the properties of the cathedral within its liberty of St. Patrick's, made by Kendrick about 1750, which are now in Marsh's Library, and from which, with the aid of Rocque's map, 1754, and the Ordnance Survey and other authentic data, I was enabled to draw a definite map of all the ancient surroundings and holdings of the cathedral of which ancient lines then remained, and which are now eliminated. These maps defined specifically the house indicated by Malton and Archbishop Ussher, a leasehold of a family named Rotton previous to 1750. With such a concurrence of record before

me it was no difficulty to mark by a cross on my map the near spot in the roadway of Patrick Street, and under the pavement, where any survival of the well might be looked for.

The occasion has arisen in the progress of the great drainage works by the Corporation of Dublin. Mr. Spencer Harty, the city surveyor, who has always an intelligent interest in the historic landmarks of old Dublin, has not failed to keep an eye on the prophetic cross on St. Patrick's map, and personally superintended the excavations at the indicated spot. He soon found the ancient causeway of Patrick Street lower by 6 feet than the present one, within a few feet of the spot instinctively indicated. The record of the well was at once verified by the finding of a very ancient cross, or rather two crosses, inscribed in high relief on a great granite stone. The well itself had disappeared. Mr. Harty, with me, attributes this to a diversion of the Poddle by an arched culvert which directed the water-power along the west front of the cathedral, turned a corn mill built against the west front of the cathedral itself, and gave its name to the "Cross Poddle," and went on to grind at other mills. This diversion and its great stone culvert was probably made in the time of Charles II., and eliminated the well itself. It could be no mere coincidence that this remarkable stone found by Mr. Harty built into the north wall of the Poddle-culvert was on the exact spot where St. Patrick's Well was looked for. It has seen the light once more on June 18, 1901, after centuries of oblivion.

The stone has been removed to the cathedral in your absence, as the popular interest about it required its safe-keeping until your direction about it can be had. It affords a most interesting example for the antiquarian of that most archaic type of Celtic cross enclosed in the mystic circle with a faint development of those cryptic rays, the tradition of which is a puzzle for speculative archaeologists. It is in such high and clear relief, despite the very ancient surface texture of the granite stone, that it suggests that this was a stone which had seen little weather exposure, and had been protected under some roof or canopy. I, who am familiar with all the stones found about the cathedral, have no doubt whatever that this new find must be grouped with other granite stones and inscribed crosses now to be identified as relics of the far-off Celtic St. Patrick's. So archaic an impression does it give that it might not be unreasonable to assign it conjecturally to any time in the ninth century. It certainly must date back to a long time before the transfer of Celtic St. Patrick's to the Anglo-Norman Archbishop Comyn in 1190.

It is possible that there will be a feeling aroused that this recovered record of the very birth of Public city, and the church, now identified as one with a tradition of 1,300 years of pious veneration, should not be disregarded, and that some memorial should mark the very site of the Well of St. Patrick.—I am, dear Mr. Dean, yours faithfully,

THOMAS DREW, Cathedral Architect.

The Very Rev. Dean Jellett.

ARCHÆOLOGY IN NORTHAMPTONSHIRE.

ABOUT two years ago a committee was formed in connection with the Northamptonshire Natural History Society for the purpose of the systematic examination of prehistoric remains in the county. The committee consisted of eight members—Mr. Frederick Bostock, Mr. Christopher A. Markham, F.S.A., Mr. F. Shepherd, Mr. W. B. Shoosmith, Mr. Beby Thompson, Mr. T. Turner and Mr. E. Turner. As one would expect, funds were not available for investigations on a large scale, and the committee have therefore been content with such examinations of selected sites as could be done with the assistance of two or three labourers. These examinations have been systematic and careful; not a spadeful of earth has been overturned in the absence of one or other members of the committee; and the result of last year's working on such lines, as it is natural to expect, has been considerable, and has produced no small addition to the sum of our knowledge regarding ancient Northamptonshire.

The report of the first year's working of the committee says that the most important investigations have been made at Holdenby, where in 1864 an Anglo-Saxon cemetery was found. With the sanction of Lord Annaly, the owner of the estate, and of Mr. Painter, the tenant, the committee spent a week in investigating this old burial-place. In 1864 six skeletons were found, in 1900 twelve. With the skeletons were discovered various relics, and as nine of the twelve bodies were those of women, it follows that the relics were mostly articles of personal adornment, such as necklaces and brooches. Two iron spears were found; beads of amber, glass and earthenware; fibulae of bronze, a few silvered and one gilt; some elaborate cross-shaped brooches of a pattern not found elsewhere; fragments of ivory, which are very rare in such interments; and a crushed cinerary urn. The cemetery dates probably from soon after the Roman evacuation of

Britain in the fifth century, and there are no doubt other interments on the spot. As the exploration committee, however, had done enough to ascertain beyond doubt what the place was, the excavations were not continued. Lord Annaly has had the finds admirably mounted by British Museum experts, and by the kindness of Lady Annaly they are now at the Northampton Museum. Two pages of illustrations of the relics accompany the report, which are faithful reproductions.

The committee, owing to the fact that the Roman tessellated pavement at Harpole, discovered fifty-five years ago, was, through the operations of agriculture, being destroyed, commenced work, with the sanction of the owner of the land, Mr. Watts, for its removal to a place of safety. The work is still in progress. There is a coloured drawing of the pavement in the Northampton Museum. The committee discovered that the tumulus at Sywell was probably nothing more nor less than the site of a burnt windmill. Excavations were made at Burnt Walls, Daventry; The Berry, Rothersthorpe, and in the moat at Clifford Hill, but with negative results. An interesting Roman well was carefully examined at Brixworth ironstone workings.

ROYAL INFIRMARY RECONSTRUCTION.

THE annexed letter has been addressed by the Glasgow Institute of Architects to the executive committee of the contributors to the Royal Infirmary reconstruction scheme:—

Gentlemen,—I duly received your letter of 18th ult., which has already been acknowledged, and I am instructed to state that the Glasgow Institute of Architects regrets that no more explicit reply has been vouchsafed to its protest and appeal by the managers and the executive than what is contained in the official statement issued to the public. Nothing in that statement in any way answers or refutes the objections previously raised by the Institute. The statement, indeed, rather confirms them; and the Institute therefore remains of the opinion that the plans as adopted "are in many vital particulars inadequate and out of date;" that their distribution on the site, particularly with regard to the Jubilee block facing Cathedral Square is bad; and that in consequence, if the reconstruction is proceeded with according to those plans, "the Infirmary will not conform to the most modern standards of design in this class of building."

The criticisms of the Institute on the previous occasion were chiefly concerned with (1) the manner in which the competition was conducted, according to which solutions of the problem other than those put forward by the managers did not receive unbiassed and adequate consideration; and (2) the insistence on the Jubilee block as an integral part of the scheme. Such a block the Institute considered to be objectionable, because (a) it would shut out from the rest of the buildings the sun and air from the southern and most open part of the surrounding area, and (b) it would dwarf and irretrievably injure the external appearance of the cathedral.

With regard to the first of these two points, while the managers in their letter refer to the block plans which they had prepared with much time and labour as being "suggestive and illustrative only," and "this is repeated in the statement and appeal of the executive, one learns also from this letter that "when the final selection was made the executive committee fixed on a plan which the assessor reported as being one of two which most closely conformed to the sketch plans," i.e. those drawn up by the managers. As further reason for the adoption of this particular plan, the executive give a list of special characteristics in respect to internal arrangements which they consider to be essential or desirable features; yet these were all contained in other designs submitted, which were at the same time free from the radical defects referred to.

As to the Jubilee block, the managers now state as their sixth conclusion—"That the new hospital and not a section of it should be regarded as alone worthy of the city of Glasgow, and as a fitting memorial to the sixty-three years' illustrious reign of the Queen." This is exactly the position adopted by several of the competitors and by the Institute, while objecting, from practical reasons already stated, to its inclusion as part of the scheme. With reference to the cathedral, it is therefore quite beside the point for the executive to state that "the buildings must be lofty if the hospital requirements of the public are to be adequately met;" for, while the buildings must be lofty, on other portions of the site (if that site is to be retained) there is no necessity for their being lofty in the direct alignment with the cathedral, nor, indeed, for there being any buildings at this point at all, as was shown in one or more of the plans submitted. The Institute does not admit that the injury to the cathedral is a question of architectural style, it is one of comparative height and scale. As regards these, the plan adopted is especially objectionable in that not only is the block itself seven storeys high, but it has in addition a lofty

spire which would further and quite unnecessarily assist to dominate and destroy the effect of the cathedral.

The Institute of Architects feel it to be their duty, in the interests of the public (for whom they speak as a body of technical experts in such matters), to thus repeat and emphasise their protest, and to again most earnestly urge the executive, before committing themselves and the public to the erection of any portion of the building as designed, to have the plans submitted to one or more independent hospital authorities of recognised and outstanding position for consideration and report. Further, should the executive object to the outlay involved in such a course, the Institute would be prepared to arrange for it and to meet the cost provided the report did not bear out their contention, while submitting beforehand the name or names of the experts proposed, on obtaining the necessary facilities from the executive.—Yours truly,

C. J. MACLEAN, Secretary.

A PARSİ TEMPLE.

IN the Parsi section of the London Necropolis Company's cemetery at Brookwood a new agiary and mausoleum, erected in memory of the late Mr. N. N. Wadia, C.I.E., were consecrated last week. The agiary and mausoleum have been erected from designs prepared under the direction of Sir George Birdwood. A fire was lighted on the altar of the chapel and prayers of consecration were uttered by Zoroastrian priests. Afterwards the company gathered round the mausoleum, from the steps of which Sir George Birdwood delivered an address on the history of the Parsi religion. Referring to the buildings which were that day consecrated, he said the erection of the mausoleum involved the removal of the old unsightly agiary or fire temple, which formerly occupied the centre of that narrow corner of ground consecrated to the Parsi dead in Europe, and the entire relaying out of the ground in harmony with the mausoleum and new agiary and the four gateways to be built on it. He resolved to lay out that Yimahi-vara, or cemetery, on the traditional plan of the Persian paradise, the ground plan to this day of all Oriental formal gardens. The mausoleum in the centre represented the seven-staged "heavenly mountain" from which the four paths went towards east, south, west and north, and for replanting the Yimahi-vara he had selected such herbaceous plants and flowering shrubs and trees as were originally natives of Persia. The new agiary had been designed from the ruins of a double gateway of the Palace of Xerxes, closing in one end and both sides, and lighting up the two sides with windows copied from the modern Persian palace of Bash No, at Shiraz. The mausoleum was a reproduction of the tomb of Cyrus, at Pasargadae, a square sepulchral chamber set on a base of seven steps and covered in with a pent roof gabled at either end. Mr. Thomas Collcutt, who designed it, had no details for his guidance, but had produced the tomb of Cyrus as it might have been had it been renovated by Greek workmen at the time of the visit of Alexander the Great. Sir M. M. Bhownaggee then delivered a eulogium on the late Mr. N. N. Wadia, who introduced in India the manufacture of thread, hosiery and the art of dyeing, and was thus a benefactor to his people. Mr. Boyce delivered an address on the late Mr. Merwanjee Dalal, after which Mr. N. N. Wadia asked the managers of the Zoroastrian Fund on behalf of his mother to take charge in perpetuity of the agiary and mausoleum. Mr. D. Naoroji (chairman of the committee) accepted the charge.

THE LIVERPOOL CATHEDRAL SITE.

THERE has been handed to the Lord Mayor for presentation to the City Council a memorial signed by several hundred ratepayers, property owners, &c., against the adoption of the St. James site for the proposed Liverpool Cathedral. The memorialists, who reside in Everton, Breckfield, West Derby, Netherfield and St. Domingo Wards, point out that they understand a site could be obtained further to the north and not so near the existing cemetery, and they were of opinion that the people in the neighbourhood should not be deprived of the Mount Gardens. They further submitted that if the decision of the bishop's site committee was not withdrawn, it would be regarded by a large number of ratepayers as a gross injustice, inasmuch as, in effect, it was a proposed desecration of St. James Cemetery. The memorialists fully recognise that it was at last disclosed that the committee were nursing a plot and ruthlessly pushing aside those who had dear ones buried there, and they felt that the Liverpool Corporation should offer opposition to this proposed sacrilege. They therefore hoped that the Council would reject the proposal.

NOTES AND COMMENTS.

THE majority of the monastic orders gained a footing in England, but with one exception they were foreign creations. That exception was the Gilbertian order. It was peculiarly English, for no belief in reciprocity gained for the order any local habitation on the Continent. The order was founded by the son of a Norman knight in the twelfth century, and it will suggest the remoteness of the period when it is known that the founder and some of his monks incurred the anger of HENRY II. for assisting St. THOMAS A BECKET to escape from England. A peculiarity of the order was that convents for monks and nuns formed part of the same establishment, but the greatest care was taken to keep the two separate. All the religious obeyed strict rules. GILBERT was a friend of the great St. BERNARD, and acted on his advice in all the arrangements for the new order. Great as BERNARD was in oratory and dialectics, he was indifferent to whatever was artistic. The Gilbertian churches were consequently of a more severe type than the Cistercian. In the remains which have survived this is apparent. Moreover, although the Gilbertian canons enjoyed many privileges, poverty was one of their characteristics. The principal house was at Sempringham. By the co-operation of Mr. ST. JOHN HOPE and Mr. H. BRAKSPEAR a plan of one of the priories is given in the new book, "S. Gilbert of Sempringham and the Gilbertines," by ROSE GRAHAM, F.R.Hist.S. (London: ELLIOT STOCK), and it suggests the peculiar arrangement by which two convents could be contiguous and yet independent. In the churches a wall was carried through the entire length from east to west, and at Walton it was 5 feet in thickness. In the nunnery the window through which the sisters spoke to their relations was "of the length of a finger, and hardly of a thumb in breadth." Under the circumstances, it is not possible to have a complete account of the buildings, but in Miss GRAHAM'S volume there is much that is interesting about the life in an order whose members offered no resistance to the scheme of HENRY VIII. for their dissolution.

FRENCH circumlocutionism is not far behind the English variety in absurdity. One curious case has been lately exhibited in connection with a project for a theatre which it was proposed to erect in Paris on a site bounded by the Boulevard des Capucines, the Place de l'Opéra, the Ruës 4-Septembre and Louis le Grand. The theatre was to accommodate about 600 people, and the plans were duly prepared. M. MORTIER, the projector, then applied to the prefecture of police and the prefecture of the Seine for permission to erect the building. In reply he was told he was at liberty to construct a theatre, or not to construct one, as he preferred. Not the least objection would be made to a theatre of the kind represented on the plans. The Commission of Security and Hygiene would simply reserve the right to prohibit the public from entering if the building did not satisfy the Commission. It would involve too much trouble to the officials if the plans had to be examined. Perhaps they might be puzzling, but a building is an object-lesson which it is easy to understand. If M. MORTIER will undertake the risk of constructing the building on such indefinite terms, he will show himself courageous as well as regardless of money.

THE castle of Pau has interest for Frenchmen, for in it HENRI QUATRE, who, all things considered, is the most admired of their kings, was born in 1553. From its position it becomes a picturesque object, while it is also an example of fourteenth-century construction. The donjon was erected in 1375, and, according to the contract deed, GASTON PHÆBUS, Comte de FOIX, agreed to furnish the bricks that were required for the walls. In spite of the regard for HENRI IV. the castle was sacked by the Revolutionists in 1793. Afterwards it was used as a barrack. The restoration of the castle was undertaken by LOUIS PHILIPPE, and at great expense he endeavoured to replace the decorations. The walls of the principal rooms were

hung with tapestry. Among the pieces are four representing scenes in the life of St. JOHN. They are of such splendid quality they were taken to Paris in order to form part of the decoration of the Petit Palais during the International Exhibition. They were afterwards sent to the Louvre. The municipal council and people of Pau protested against the breach of faith on the part of the Government, and with so much effect, the tapestries have been sent back to the old castle. In the present state of France the Ministers cannot afford to lose the support of a much less important place than the ancient capital of Navarre.

A CONGRESS of architects, surveyors and engineers was recently held in Melbourne. The most important business transacted was the discussion about the selection of a site for the contemplated Federal capital. The resolutions adopted were as follows:—"That in order to secure the best possible position, before any site be decided upon for the Federal capital, an independent report be obtained from a commission comprising members of the engineering, architectural and surveying professions, together with medical and business experts. That it is important the Federal capital should be laid out in the most suitable manner possible; to avoid the mistakes made in many other cities by preserving existing buildings it is desirable that for any site selected all buildings that would in any way prevent the adoption of the most perfect plan should be removed." The planning of Washington in the United States was not sufficiently considered after the Revolutionary war, and the consequence is that the buildings in the "city of magnificent distances" are not seen to advantage, and any alteration of the streets would be too costly an experiment to undertake. The Australian Governments will be wise if they derive a lesson from the American failure.

IF the report of the commission appointed by the General Assembly to consider the state of Blackbraes Church can be taken as applying to other churches in Scotland, it would be well if a second Mr. CARNEGIE were to arise to provide funds for reparations. The worshippers in the Blackbraes Church might as well perform their devotions in the open air. Although, no doubt, it is considered an advantage to be able to contemplate the sky through the holes in the roof, on wet Sabbaths the congregation have to protect themselves with their umbrellas. Since the church was erected no effort has been made to find substitutes for any slates that may have fallen, or to repair any defects in the building. There was no one who could deny the neglect, which was described by one of the committee as a disgrace to any Christian body. Reparation now would be so costly, it is judged by some members to be more economical to erect a new building, and at present the subject of temporary accommodation is engaging the attention of a committee.

CATHEDRAL SERIES.—CHICHESTER: FROM ST. RICHARD'S WALK.

EMBLEY PARK, NEW ENTRANCE HALL.

THIS drawing, which was hung in the Royal Academy Exhibition two years ago, shows the new entrance hall recently carried out to this house, together with extensive internal alterations. The new hall was formed by taking out the floor over and throwing it up two storeys in height, with a new staircase at one end. The whole of the joinery work is in wainscot, and was executed by Messrs. NORMAN & BURT, of Burgess Hill, Sussex. The architect was Mr. H. O. CRESSWELL, of 17 Buckingham Street, Adelphi, W.C.

By T. FRANCIS BUMPUS,

Author of "Ecclesiologia Germanica," "Summer Holidays among French Cathedrals," &c.

A BRIEF REVIEW OF ECCLESIOLOGICAL PROGRESS, 1855 TO 1875.

(Continued from page 404, vol. lxxv.)

HAD it not been for his untimely decease—accelerated it is said by grief at the rejection of his statues of the Latin Doctors from the north porch of Bristol Cathedral—Redfern might have become one of the greatest Christian sculptors of the age. This is apparent in the groups composing the reredos of Gloucester Cathedral, in the statues on the western façade of Salisbury, in the reredos of the same cathedral, in the group of the Resurrection within the tympanum of the doorway to the mortuary chapel at Sherborne, and above all, perhaps, in the reredos of St. Andrew's, Wells Street, erected between 1865 and 1868, from the designs of Street, and most probably on the motif of certain great Spanish retabula which that architect had then lately returned from studying.

It was Rev. Benjamin Webb—co-founder of the Ecclesiological Society and third vicar of St. Andrew's, and whose

colouration of this reredos at St. Andrew's, Wells Street, was pressed by Mr. Bodley, but to this course Mr. Webb always entertained a strong objection, and rightly, seeing that the groups are of alabaster.

In the case of the reredos at St. Augustine's, Haggerston,* a work of singular beauty from the designs of Mr. Woodyer and the chisel of Mr. Thos. Nicholls, the recent application of colour under the direction of Mr. R. A. Briggs, F.R.I.B.A., was an absolute necessity, five-and-thirty years of accumulated smoke and dirt having so begrimed the stone as to render futile either scraping or cleaning. At present the hues of this colouration rather overpower the surroundings, but time and the atmosphere of north-east London will do much towards toning them down to a soberer key.

One of the most important and extensive works in the department of decorative sculpture undertaken in England since Mediæval times is that upon the west front of Lichfield Cathedral, which had been completely cased in Roman cement by Bernasconi between 1820 and 1822.† Some ameliorations were effected here in 1867-68, when the present west window was inserted by Sir Gilbert Scott in lieu of one, debased certainly, but not without character, and dating from the time of Charles II. Early in the seventies a project had been formed for effecting a more complete restoration of the façade and for filling its almost entirely denuded niches with statuary upon a well-considered and carefully prepared scheme of iconography.

THE REREDOS, ST. AUGUSTINE'S, KILBURN. (J. L. Pearson, Architect. Thos. Nicholls, Sculptor.)

taste convoked an assemblage of instrumenta which invest that early Tractarian church with an interest apart from its primary one, and that was not inconsiderable—who discovered Redfern. This was during the fifties, when Mr. Webb held his first benefice—St. Luke's, Sheen—in a limestone district of Staffordshire which had already produced Chantrey. Although a stranger to any carving, Redfern was found by the Vicar of Sheen amusing himself with modelling in the round in alabaster from cuts in the *Illustrated London News*. Finding the youth had some genius he introduced him to Mr. Beresford Hope, and through the united instrumentality of these two vigorous pioneers of the Gothic movement, the future sculptor of the St. Andrew's, Wells Street, reredos was sent to London and placed with Mr. Clayton, so that when in 1862 Mr. Webb became vicar of St. Andrew's, and shortly after set on foot numerous works for the ornamentation and improvement of that somewhat gloomy edifice, he did not forget his former protégé when the amelioration and enrichment of its most sacred portion came under consideration. During the lifetime of Rev. Benjamin Webb the

The work—entrusted to four sculptors, Mr. Seale, Mr. Ingram, Mr. Bridgeman and Miss Grant—was commenced in 1877, and seven years later stood almost completed, an undertaking reflecting the greatest credit upon all concerned

It would prolong this history to an interminable length were a catalogue *raisonnée* of all the works in decorative sculpture executed for ecclesiastical purposes during this busy epoch of the Gothic movement to be given. Yet it would be unpardon-

* Illustrated and described in *The Architect*, Sept. 21, 1900.

† With the exception of four or five effigies upon the north-west tower, and which can readily be distinguished from the modern sculpture by their darker hue, all the imagery that had been defaced by the Puritans during the siege was removed from the west front of Lichfield Cathedral in 1749. Bernasconi's work included a row of seated figures of kings in the series of arcades extending across the façade immediately above the three doorways, and standing effigies of the Virgin and Child and four other saints against the shafts of the recessed central portal. Although undertaken with the best intentions, the work was wretched and purely conjectural; its removal, therefore, upon the commencement of the true restoration of the façade, was by no means to be regretted.

able to omit mention of such works as Mr. Nicholls's four groups from the infancy of Our Lord, which, designed by William Burges, form the reredos in Waltham Abbey church; the same sculptor's recumbent effigies of St. Andrew's, Wells Street, second incumbent, Rev. Jas. Murray—an Italianising Pointed recessed tomb in the south aisle, also designed by Burges; the reredoses in St. Augustine's, Kilburn, and the chapel of the House of Mercy at Clewer—characteristic designs of Mr. Pearson and Mr. Woodyer respectively—both from Mr. Nicholls's ateliers; Mr. Pfeiffer's bas-relief of the "Conversion of King Ethelbert" in the chapel of St. Augustine's College, Canterbury; Mr. Theed's beautiful *coenacolo* in statuary marble above the altar of St. Saviour's, Croydon; some Early English arcading from Mr. J. K. Colling's designs at the east end of the pseudo-Gothic St. Mary's, Somers Town; Mr. Boulton's work in Worcester Cathedral; and Mr. Geflowski's tier of niched figures forming the reredos in All Souls College Chapel, Oxford, both these last-named works being restorations of, and supplementary to, ancient existing remains.

Streater, who enjoyed much celebrity as a court painter under the Merry Monarch, was commissioned to paint a mural picture of the "Last Judgment" in oil of turpentine, and although it is recorded that the carved oaken *misereres* were to be "altered and made suitable," little damage seems to have been done in this direction. John Evelyn, who saw the picture shortly after its completion, declared it to be "too full of naked for a chapel," and Baskerville, who, visiting the building some fifteen years later, described it as a "very good chappel, pav'd with black and white marble," noticed that "on ye wall at ye east ende is painted ye Resurrection, among the rest old Chichele rising out of his tombe. But the colours have now lost much of their beauty, and I believe people in these dayes have not the skill to paint on walls as in former times." Streater's painting remained only until early in the eighteenth century, when it was replaced by one representing the "Apotheosis of Chichele," by Sir Jas. Thornhill. An altar-piece, with its pediment supported by Corinthian pillars coupled, was filled in 1770 with a "Noli me Tangere," by Raphael Mengs. A view in Ackermann's "Oxford" (1814)* shows the appearance presented by

THE REREDOS, ALL SOULS COLLEGE CHAPEL, OXFORD.
(Restored by Geflowski under the direction of Sir Gilbert Scott.)

THE REREDOS, OXFORD CATHEDRAL.
(G. F. Bodley, Architect.)

The accompanying illustration of the reredos in Archbishop Chichele's graceful chapel of All Souls, built on the same plan as those of New and Magdalen, and, like them, destitute of an east window owing to the contiguous hall, precludes a lengthened description of this the most beautiful work of its kind in England. A few words, however, relative to its discovery and restoration may not be uninteresting, merely premising that, the photograph having been taken about twenty years ago, the bare portion of walling between the group of the Crucifixion and the altar has since been filled with a retabulum of three groups in sculpture. This glorious work, which stood completed in 1493, was, little more than a century later, pitilessly defaced by the Reformers and its niches despoiled of their effigies. Thus it remained until 1665, when during the wardenship of Dr. John Meredith the chapel was "remodelled," that is to say, the hammer-beam roof was concealed by a stucco ceiling panelled, and the mutilated fifteenth-century reredos masked by a coating of mortar and plaster, upon which

All Souls College Chapel until 1872, when Sir Gilbert Scott was called in to superintend its restoration, as far as possible, to its pristine fifteenth-century form. The Caroline ceiling of 1665 being removed the exquisite hammer-beam roof was disclosed, and on denuding the east wall of Thornhill's and Streater's paintings, the mutilated reredos was brought to light—a discovery "causing no little excitement both in and outside Oxford, and even in the prosaic business reports of the committee can be read the thrill of surprise and delight inspired by this unlooked-for revelation. But the discovery was terribly embarrassing; much money had already been spent; to bring the chapel back to its original form meant an outlay from which the most ardent Mediævalist might well shrink. At this point Lord Bathurst saved the situation 'by expressing his wish to restore the reredos at his own expense.' A fresh appeal, stimulated by this munificence, was made to, fellows and quondams, with the result that,

* The hammer-beam roof shown in Ackermann's view must have been "restored in imagination."

under Sir Gilbert Scott's direction, by 1879 the chapel took the form so familiar to every visitor to-day. . . . In the features of the reredos figures the sculptor has 'immortalised' many of the then fellows, while a well-known college joke tells how one member, anxious for a like privilege, was informed the only vacancy left was amongst 'the lost souls.' (Grant Robertson.)

Next to that of All Souls, the most beautiful and successful reredos in a city whose ecclesiastical treasures present an *embarras de richesses* to the visitor, is that placed two-and-twenty years ago in the cathedral by an anonymous donor. The general design of the work due to Mr. G. F. Bodley is based upon a study of the best fifteenth-century examples, its triptych-like character being most refreshing after the formality of too many altar-pieces set up previously in our cathedrals and churches. The effigies, carved in rosso antico by Mr. Brindley, jun., are—to the left of the Crucifixion, St. Michael in armour and St. Stephen in albe and dalmatic, and to the right St. Augustine vested in cope and mitre, and St. Gabriel. Rich side hangings materially enhance the effect of the reredos, besides assisting to impart an appearance of warmth to this end of the building.

Of altar-pieces executed in mosaic those in Westminster Abbey by Messrs. Clayton & Bell, completed in 1866 under the superintendence of Sir Gilbert Scott,* and that in Chester Cathedral a little later by Messrs. Heaton, Butler & Bayne, from Sir Arthur Blomfield's designs, deserve mention. Both representing the Last Supper are very beautiful in conception and design, but less suited in merely historical treatment for this position in a church than for a refectory, as, for instance, in the famous *cenacolo* at Milan.

Tryptichal and painted altar-pieces were not so extensively used as they have been of late, but the few produced during the sixties and seventies were of a very high order; one of them indeed, that in Llandaff Cathedral, finished in 1862 by Dante Gabriel Rossetti, and representing in a subdued pre-Raphaelite style "Christ sprung from high and low as united in the person of David, who was both shepherd and king, and worshipped by high and low at His birth," having attained a wide celebrity for excellence of design and originality of treatment.

We must not forget Sir Frederic Leighton's mural painting of the parable of the Ten Virgins above the altar of Lyndhurst Church, which, though it may not seem to some to accord from an architectural standpoint, is of its kind a remarkably fine work; nor Sir Edward Burne-Jones's altar-piece in St. Paul's, Brighton; nor the triptych by Mr. N. H. J. Westlake in St. Mary's, Aberdeen, which, in many particulars pre-Raphaelite in feeling, possesses great dignity and character, especially observable in the figures of The Crucified, St. Mary and St. John. Indeed, the whole design is pervaded by a calm severity, yet a richness and warmth, which latter qualifications caused it to come as a welcome relief from the, in too many instances, unsatisfactory stone editions of the same feature. An oblong stone slab, painted by Messrs. Lavers & Barraud, with a representation of the Last Supper, in St. Michael's, London Fields, Hackney, falls into this category.

Mr. Somers Clarke, junior's, church of St. Martin, Brighton, was equipped shortly after its completion (c. 1875) with a painted reredos, which for size and gorgeousness defies description while Mr. Bodley's church of St. Michael at the opposite extremity of the town had received somewhat earlier a triptych altar-piece, greatly enhancing the already beautiful and solemn sanctuary of that now, alas! spoilt church; while Messrs. Clayton & Bell's altar-piece, formerly above the high altar, but now in the side chapel, of St. John Divine, Kennington, consisting of a cinquefoliated centre and triptych wings, must be considered one of the most successful works of its class.

The Yarmouth Town Council have unanimously appointed Mr. Herbert A. Millington, deputy town clerk of Richmond, to be town clerk of Yarmouth, at a salary of 600*l.* a year, rising to 800*l.* There were twenty-seven candidates.

* For the carved cornice of this *cenacolo*, as well as for the statues of Moses, St. Peter, St. Paul and King David in the niches, Mr. Henry Hugh Armstead, R.A., was responsible. A reredos by this gifted sculptor was executed about the same time for St. Mary the Great, Cambridge.

JOHN HOPPNER, R.A.

THE payment of the unprecedented sum of 14,050 guineas for a three-quarter length portrait of Lady Louisa Manners, afterwards Countess of Dysart, by John Hoppner, has revived the name of the artist. No less remarkable was the price, 8,000 guineas, given for a full length of a Mrs. Farthing, which has been attributed to Beechey, Shee and Owen, but is now assumed to be a work by Hoppner. The liberality of the dealers may be interpreted as a sign that Hoppner is no longer to be neglected, but is to become a source of profit. As his career must, under the circumstances, have interest, we reprint Allan Cunningham's biography of the painter:—

John Hoppner was born in London some time in the summer of 1759. There is a mystery about his birth which no one has ventured to explain: all that is known with certainty is that his mother was one of the German attendants at the royal palace. The king caused the child to be carefully nursed and well educated; when he grew up, as his voice was sweet and melodious, he was made one of the choristers in the royal chapel. All this benevolence was misunderstood. George III. was pious and generous, and such acts of kindness became him, but slanderers were not wanting to insinuate that His Majesty had good natural reasons for all this tenderness, and it is said some such gossips actually possessed the boy himself with a notion of very lofty parentage. I believe there is no doubt that when he grew up he was willing enough to have it understood that he owed something more than his nursing and education to the throne. This was most probably the mere ruse of a shrewd man, who felt how much such a surmise would help his fortune; but it received some sort of countenance from the very active patronage of the Prince of Wales (George IV.) who supported him against the rising fame of Lawrence and Owen, and the settled reputation of Opie, and crowded his studio with princes, peers and fine ladies.

Of the boyish studies of Hoppner we have heard little on which we can rely. He availed himself of the advantages held out by the Royal Academy, and entering a probationer with his chalk and paper, ascended slowly and systematically through all the steps required till, with paint on his palette and a brush in his hand, he contended for the highest prizes of the institution. With such success did he study, and so fortunate was he in his sketches and his early attempts, that before his twenty-fourth year he was looked upon as one likely to become great in landscape, and who already painted heads in a way worthy of a more established name. As soon as it was safe as a matter of taste to befriend him, he found patrons, and powerful ones. Mrs. Jordan sat to him in the character of the Comic Muse, supported by that

— goddess fair and free,
In heaven yclep'd Euphrosyne,

to whom the artist confided the task of repelling the advances of a satyr. We know not what might be meant by this; but the work was much liked. The fair dame sat again as "Hippolite." Another was a lady of quality shadowed forth under the not very flattering name of a Bacchante; but as the colours were glowing and the face lovely the audacity of the name might be forgiven. Then followed the portraits of the Duke of York, of his duchess, of the Prince of Wales and the Duke of Clarence, afterwards King William IV., with ladies of quality and noblemen not a few and gentlemen without number. His time, however, was not as yet so wholly occupied with sitters as to hinder him from continuing to work in what artists technically call the "fancy way." A Sleeping Venus, a Belisarius, Youth and Age and other productions, half natural and half ideal, belong to his early days.

All this, and much more, had befallen him before his thirtieth year; and as his colouring was rich, and his style of portraiture captivating to the vain side of human nature, his commissions increased in number, money poured in and fame grew and spread. The light of the Prince of Wales's countenance was of itself sufficient to guide the courtly and the beautiful to his easel. Suffice it to say that before he was forty years of age he had been enabled to exhibit no less than fifteen ladies of quality, for so are they named in the catalogues, a score of ladies of lower degree and noblemen unnumbered. By this time another court star had arisen destined to outshine that of Hoppner, though some at that period, willing to flatter the older practitioner, called it a meteor that would but flash and disappear; we allude to Lawrence. Urged upon the Academy by the king and queen, and handed up to notice by royal favour, this new aspirant rose rapidly in the estimation of the public; and by the most delicate flattery, both with tongue and pencil, became a formidable rival to the painter whom it was the prince's pleasure to befriend. The factions of Reynolds and Romney seemed revived in those of Hoppner and Lawrence. If Hoppner resided in Charles Street, at the gates of Carlton House, and wrote himself "portrait painter to the

Prince of Wales," Lawrence likewise had his residence in the court end of the town, and proudly styled himself, and that when only twenty-three years old, "portrait painter in ordinary to His Majesty." In other respects, too, were honours equally balanced between them: they were both made Royal Academicians; but in this youth had the start of age—Lawrence obtained that distinction first. Nature, too, had been kind—some have said prodigal—to both; they were men of fine address and polished by early intercourse with the world, and by their trade of portrait-painting could practise all the delicate courtesies of drawing-room and boudoir; but in that most fascinating of all flattery, the art of persuading with brushes and fine colours very ordinary mortals that beauty and fine expression were their portions, Lawrence was soon without a rival.

The preference of the king and queen was for a time balanced by the affection of the Prince of Wales. The latter was supposed to have the best taste, and as he kept a court of his own, filled with young nobility and all the wits of that great faction known by the name of Whig, Hoppner had the youth and beauty of the land for a time, and it cannot be denied that he was a rival every way worthy of contending with any portrait-painter of his day. The bare list of his exhibited portraits will show how and by whom he was supported. To twenty ladies of quality, who lent their looks but withheld their names, we may add the following:—1, the Countess of Clare; 2, the Hon. Miss Chetwynd; 3, Lady Anne Lambton; 4, Countess of Oxford; 5, Hon. Mrs. Edward Bouverie; 6, Mrs. Whitbread; 7, Miss Grimstone; 8, Lady Grenville; 9, Lady Mildmay; 10, Lady E. Bligh; 11, Miss Cholmondeley; 12, Lady Mulgrave; 13, Hon. Miss Mercer; 14, Mrs. Jerminham; 15, Mrs. Manning; 16, Miss St. Clair; 17, Countess of Essex; 18, Lady Melbourne; 19, the Countess of Sutherland. It is well said by Williams, in his "Life of Lawrence," that "the more sober and homely ideas of the king were not likely to be a passport for any portrait-painter to the vanity of ladies; and hence Mr. Hoppner for a long time almost monopolised the female beauty and young fashion of the country." He had his share, too, of the men. In the period of time (six years) over which the list we have given of beauty extended he had the following male sitters:—1, the Bishop of Durham; 2, Bishop of Carlisle; 3, Duke of Grafton; 4, Lord Camden; 5, Sir Arthur Wellesley; 6, Sir William Scott; 7, Right Hon. H. B. Frere; 8, Lord King; 9, Right Hon. T. Grenville; 10, Lord Hawkesbury; 11, Right Hon. C. Long; 12, Sir Samuel Hood; 13, Earl of Essex; 14, Sir George Beaumont; 15, Earl Spencer; 16, Earl St. Vincent; 17, Earl of Chatham; 18, Duke of Rutland; 19, Archbishop of York; 20, the Prince of Wales. The Duke of York's portrait was painted twice, the Duke of Clarence thrice, and the Prince of Wales thrice.

This rivalry of the court painters continued for a time in the spirit of moderation; that spiteful courtesy which the world teaches,

Willing to wound, and yet afraid to strike,

was visible between them. Lawrence, the gentler and the smoother of the two, kept silence longest; the warm nature of Hoppner broke out at last. "The ladies of Lawrence," said he, "show a gaudy dissoluteness of taste and sometimes trespass on moral as well as professional chastity." For his own he claimed, by implication, purity of look as well as purity of style. This sarcastic remark found wings in a moment, and flew through all coteries and through both courts; it did most harm to him who uttered it; all men laughed and then began to wonder how Lawrence, limner to perhaps the purest court in Europe, came to bestow lascivious looks on the meek and sedate ladies of quality about St. James's and Windsor, while Hoppner, limner to the court of a gallant young prince, who loved mirth and wine, the sound of the lute and the music of ladies' feet in the dance, should to some of its gayest and giddiest ornaments give the simplicity of manner and purity of style which pertained to the quakerlike sobriety of the other. Nor is it the least curious part of this story that the ladies, from the moment of the sarcasm of Hoppner, instead of crowding to the easel of him who dealt in the loveliness of virtue, showed a growing preference for the rival who "trespassed on moral as well as on professional chastity." After this Lawrence had enough of gentle sitters. It must not be supposed that he heard Hoppner's injurious words with patience; he vindicated the professional as well as moral purity of his style in firm and temperate language; but he was on the winning side, and could the better take moderation for his motto.

The king all this time was of the Lawrence faction, for which various reasons have been assigned. Hoppner was an enthusiastic admirer of Reynolds, and when young had filled the palace with praises of his kindness as a man and his genius as an artist. His Majesty never liked Sir Joshua. This offence was trebled when Hoppner, resenting perhaps the coldness with which his earliest works were received at St. James's, openly joined the party of the Prince of Wales

and added his wit, which was ever ready, and his influence, which was on the rise, to the ranks of Whiggism. This was, perhaps, less than prudent in a man of genius, who, born for his country, should not give himself up to either of those parties whose fierce hostility had so long torn the island; but it was doubly imprudent in one who had become a husband and a father, and who had to win bread and fame from the patronage of the population at large. When the crop of handsome Whigs was reaped, he could not put his sickle into the ripe harvest of the Tories. Lawrence, meantime, with a prudence which Hoppner called hypocrisy, was silent in the matter of politics, belonged to neither faction, and so kept his easel ready and his colours in order for all.

Those who merely consider Hoppner as a limner of men and women's heads, who dashed them off at a few sittings, pocketed the price, replenished his palette, and prepared himself for any new-comer, do his memory injustice. He was a fine free-spirited manly fellow, overflowing with wit and humour, inconsiderate in speech, open-hearted, and as well acquainted with the poetry and history of his native country as the most gifted of her sons. The fame of his conversational powers survives among his companions. He was considered one of the best-informed painters of his time, and in the company of the learned, not less than among the gay and the noble of that day, he was easy and unembarrassed. Amongst his brethren of the easel he was still more at home, and made himself welcome by his ready wit and various knowledge. It was sometimes his pleasure, in the midst of a serious discussion, to start aside into the whimsical or the humorous, and in the midst of boisterous mirth he would as suddenly return to seriousness. Few could be quite sure when they had his sympathy, except, indeed, in the hour when it was really wanted—for then it failed not. He loved to surprise his friends, and if he raised a laugh, seemed to care little whether it was for him or against him. He and Edridge and two other artists once went into the country, quartered themselves at an inn where the ale was good, and as a fair was held in the neighbourhood, they walked out about sunset, when merriment begins, and mingled in the crowd. There was much din and drollery. Hoppner addressed his companions:—"Listen, you have always seen me in good company and playing the courtier, and in fine took me for a damned well-bred fellow and genteel withal. A mistake, I assure you. I love low company, and am a bit of a ready-made blackguard—see." He gave his coat a queer pull, his neckcloth a twitch, knocked his hat awry, and putting on a face of indescribable devilry started into the midst of a mob of reeling rustics, and in a moment was "hail fellow, well met," with the wildest of them. But rough gambols and homespun wit seemed not enough for his new character; he edged himself into a quarrel with a brawny waggoner, and had a capital set-to with the fists, in which the latter, though a powerful boor and withal a practised boxer, was roughly handled. He gave his antagonist half a guinea, set his hat and neckcloth right, and retired amid the applause of the crowd.

Though Hoppner confined himself chiefly to portraiture, he was not only skilful in landscape, but a most ardent lover of the higher branches of the art. He was not one of those who imagined when he painted a portrait he had done something historical, and who recognised in his likenesses of the ladies of the hour the great leading principle and moral and intellectual loveliness. He was an admirer, too, of the labours of such of his brethren as went to poetry and history for their subjects, and the following letter to Cumberland concerning Stothard's *Canterbury Pilgrimage* will show how justly he could feel and how well he could express himself. It is dated May 30, 1807:—"This intelligent group is rendered still more interesting by the charm of colouring, which, though simple, is strong, and most harmoniously distributed throughout the picture. The landscape has a deep-toned brightness which accords most admirably with the figures; and the painter has ingeniously contrived to give a value to a common scene and very ordinary forms that would hardly be found by unlearned eyes in the natural objects. He has expressed, too, with great vivacity and truth, the freshness of morning at that season when nature herself is most fresh and blooming—the spring; and it requires no great stretch of fancy to imagine we perceive the influence of it on the cheeks of the fair Wife of Bath, and her rosy companions, the monk and friar. In respect of the execution of this very pleasing design, it is not too much praise to say that it is wholly free from that vice which painters term manner; and it has this peculiarity beside, which I do not remember to have seen in any picture, ancient or modern, namely, that it bears no mark of the period in which it was painted, but might very well pass for the work of some able artist of the time of Chaucer. The effect is not, I believe, the result of any association of ideas connected with the costume, but appears in primitive simplicity and the total absence of all affectation either of colouring or pencilling."

Hoppner was one of many artists who imagine they behold in the high prices and ready sale of the works of the great

Italian masters a settled prejudice on the part of the public against all works of living men of modern times. He was in the habit of saying, when he looked upon a fine work of his own day, "Ay, it is a noble picture; but it has one damning defect—it is a modern one. Prove it, sir, to be but 200 years old, and from the brush of a famous man, and here's 2,000 guineas for it."

The time was, however, at hand when Hoppner was to be no more moved in spirit either by the success of Lawrence in portraiture or by the general preference of the public for the historical pieces of long buried masters. A visible change had for some time appeared in his looks; his conversation had grown rambling and incoherent; few works came from his hand; and though his skill seemed not impaired he wrought, at best, by fits and starts. A gentleman has told me that towards the close of Hoppner's days he carried a message to him from the Prince of Wales concerning a picture then on his easel. He found the painter violently agitated; he had his palette in his left hand, and was dipping his pencil in the colours, and running to and fro, giving a touch here and a touch there to the picture. He turned suddenly round, and said in a tone of great mildness, "Sir, a thought struck me as you came in; I was unwilling to lose it; the picture has the benefit of it, and that must excuse my seeming rudeness to you." An anecdote related by Northcote is characteristic. "I once went with Hoppner to the hustings to vote for Horne Tooke; and when they asked me what I was, I said, 'A painter.' At this Hoppner was very mad all the way home, and said I should have called myself a portrait-painter. I replied the world had no time to trouble their heads about such distinctions."

During the early part of the year 1810 it was generally known that the health of Hoppner was declining, and it was the feeling of his friends that he had not long to live. His wife was careful and affectionate; his sons were growing up and their minds expanding, and he loved, as all fathers love, to talk of the hopes he had in them—hopes amply fulfilled, though he did not live to see them. It was thought that want of success in some later works weighed on him a little, but when the constitution begins to give way there is no need to press the body down with imaginary ailments. He felt that internal feebleness and sinking of mind against which all medicine is weak and kindness of friends unavailing. Many inquirers came, and kind ones, one among the most anxious, it is pleasing to know, being Lawrence, who went repeatedly. Hoppner, it is said, saw in such visits more of joy at his approaching death than of true sympathy for the sorrows of a brother. But this, I doubt not, was unjust to Lawrence, who, amidst too much of the silken show of courtesy, was naturally kind-hearted and of a generous nature. He shall speak for himself; these are his words to a friend:—"You will be sorry to hear that my most powerful competitor—he whom only to my friends I have acknowledged as my rival—is, I fear, sinking into the grave; I mean, of course, Hoppner. He has always been afflicted with bilious and liver complaints, and to these must be greatly attributed the irritation of his mind, and now they have ended in a confirmed dropsy. But though I think he cannot recover, I do not wish that his last illness should appear to be reported by me. You will believe that I sincerely feel the loss of a brother artist, from whose works I have often gained instruction, and who has gone by my side in the race these eighteen years." Hoppner did not live long after the writing of this letter; he died in the beginning of April 1810 in the fifty-first year of his age.

The worth of his works has been widely acknowledged; he was one of those painters who, with powers and skill for the higher line of art, are compelled by omnipotent taste to labour in the lower line, where employment is certain and recompense sure. Yet labourer in the humbler department of portraiture though he was, he strove to unite with mere likeness the higher qualities of art, and in that simplicity and austere composure of style which he claimed for himself, when he satirised the loose touches of Lawrence, he beheld a closer affinity to the spirit and sentiment of those noble works which he set up as his models. Yet Hoppner was no blind worshipper of the gods of others; his chief deity was nature—nature exalted and refined; he sought for elegant simplicity of form and poetic loftiness of sentiment, and often found both.

BRONZE RELICS IN BRIGHTON.

WHILE digging foundations for a house in Bonchurch Road, Brighton, the workmen discovered, says the *Sussex Daily News*, two fine bronze bracelets belonging to the Bronze Age. The bracelets are of a design which might recommend itself to any modern jeweller for grace and simplicity of form, though it would be as well to reduce the design to a lighter weight, for although these ornaments were apparently worn by ladies of the Bronze Age

with as small, if not smaller hands and wrists as any tennis belle of the present day, they are no less than a pound in weight. They would appear to be of special interest to Brighton ladies, since all the recorded examples of these bracelets, which, however, are very rare, have been discovered in the vicinity of Brighton, the ancient camp at Hollingbury Hill being about the centre of the area of discovery. These two bracelets are technically described as having been "formed from a long bar of bronze (one being quadrangular and the other circular in section), doubled over so as to leave a broad loop to the middle and then curved round so as to form the bracelet, the two ends of the bar being bent over to form hooks which engage the centre hoop, and which, from the stoutness of the metal, must have been immovable when fixed."

They have been found ornamented with minute serrations at the angles and engraved with a herring-bone design. Some of the finest examples of the art of the Bronze Age have been discovered at and near Brighton, but the fine amber cup in the town museum and these bracelets (of which the museum, unfortunately, does not possess an example), are among the finest examples yet discovered in England. Some years ago two pairs of bracelets of the same design were discovered at Hollingbury Hill, and formed part of the collection of the late Dr. G. Mantell. These seem to have been secreted within a hole beneath the turf by some Brighton belle many hundreds of years before the Christian era. They were then, no doubt, as bright as gold, and the fair owner had arranged them lovingly and carefully around a fine twisted bronze necklet or torque, and so left them in their long home amid the wild thyme of the Sussex Downs. The recent discovery of similar bracelets led Mr. Dawson to hope that other ornaments might have been associated with them, and a search was made, an adjoining house being partially undermined for the purpose, but, unhappily, without success. Brighton seems to have been as popular, if not so populous, in the Bronze Age as it is in the age of "Hardened Steel." Quite recently no less than one hundredweight of bronze axe-heads were discovered in excavating for a house in the Dyke Road at Brighton. All these, with the exception of a solitary example, found their way to a "marine store" in Brighton, and thence to the melting-pot.

THE RESTORATION OF BATH ABBEY.

THE Rector of Bath says:—The restoration of Bath Abbey has now reached a stage when help from outside the city and county is required. The restoration of the famous west front has already been completed. Of itself this work has been no small one. A front erected four centuries ago, containing some seventy figures, and representing Jacob's Vision at Bethel, accredited to a dream of Bishop Oliver King, might have meant an expenditure heavy indeed; but this has been avoided by the careful and conservative repair executed by the architect, Mr. T. G. Jackson, R.A. As it is, however, the cost of this and other necessary work is from 3,000*l.* to 4,000*l.* Funds are sought for further repairs, which the architect regards as urgently necessary. These are structural, and involve the restoration and in some cases rebuilding of some of the flying buttresses, which are so vital and beautiful a feature of the church. It is hoped that a sum of 5,000*l.* to 6,000*l.* will cover the whole of the present expenditure on the building. The historic associations of Bath Abbey date from A.D. 676; it was the scene of the coronation on Whit Sunday A.D. 973 of King Edgar, "an inauguration of the king of all the nations of England," who was crowned by Archbishops Dunstan of Canterbury and Oswald of York; next to Westminster Abbey it is said to be most famous for its monuments to the illustrious dead; and, in its present condition, it is quoted as a noble specimen of Perpendicular architecture and one of the very last great churches built in England previous to the Reformation.

SOCIETY OF ARTS CONVERSAZIONE.

AN ideal summer evening, a charming locale, and an ample and admirably arranged programme assured the success of the al-fresco soirée given by the Society of Arts in the gardens of the Royal Botanic Society on Friday last, when a numerous company assembled in the beautifully illuminated grounds and enjoyed the music discoursed by the bands of the H.M. Royal Artillery and Grenadier Guards. In the club-house the Royal Criterion Hand-bell Ringers and Glee Singers gave a pleasing selection of vocal and instrumental music, and a pastoral play was performed in a glade adjacent to the east lawn. An exhibition of rhododendrons was on view in a marquee in the gardens. In another was a magnificent display of growing and cut roses, shown by Messrs. Wm. Paul & Son, of Waltham Cross, while innumerable little tables were grouped in tents or in the open air, at which visitors could partake of refreshments while enjoying the music and watching the throng of promeneurs.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE following gentlemen have passed the Midsummer examinations:—

Preliminary.

Bagot, Walter Hervey, South Australia; Benjamin, Ashley Florian, London; Billings, Percival Upton, Sale; Birkett, Stanley, Manchester; Booth, Alfred, Barnsley; Bown, Harold Linley, Harrogate; Bray, Arthur George, Bolton; Brook, Tom Harvey, Holmfirth, near Huddersfield; Bulmer, Francis Holles, Woolwich; Burbage, James Herbert Ransome, Southampton; Burke, Martin Joseph, Dublin; Cartwright, Harry, Finchley; Chamberlain, Arthur, Newcastle-on-Tyne; Chaundler, James Herbert, Eastbourne; Cheate, Roland Henry, Burford, Oxon; Clay, Herbert, Gainsborough; Clifford-Smith, Wm., Poole, Dorset; Clissold, William, Minchinhampton; Cobbett, Guy Bernard, Addlestone; Collins, Alfred Francis, Windsor; Cooper, Charles Sydney, Gainsborough; Crabb, Henry Ralph, Exeter; Culley, Norman, Huddersfield; Curwen, Robert Babington, South Woodford; Dahl, John Love Seaton, Liverpool; Davidson, George Veitch, Paisley; Day, Victor Albert George, Old Aberdeen; Dick, Norman Aitken, Edinburgh; Dicks, Harold Edward, Cheltenham; Dod, Edwin James, Birkdale, Southport; Donnelly, Robert, Holywood, co. Down; Downs, Harry Beecroft, Guiseley, Yorkshire; Duncan, Alexander McLachlan, Perth, N.B.; Durston, Cecil Campbell, Weston-super-Mare; Eaton, Charles William, Leicester; Edwards, Sidney Albert, Essex; Ellis, Theodore Moorhouse, Hull; Fifoot, Louis Stanley, Cardiff; Gibson, George McLean, London; Gill, Charles Lovett, London; Gott, Joseph Harold, Margate; Gould, George Harry Bertram, Ipswich; Gutteridge, Reginald Fowler, Southampton; Gwynne, Gordon Iltydd, Boscombe; Hall, Stanley Alexander, London; Halliday, James Theodore, Plymouth; Hart, Francis James Watson, London; Hastewell, Robert Edwin, Haltwhistle; Hedges, Frank Russell, Wisbech; Higson, Herbert Walker, Bolton; Hill, Samuel Woods, London; Hird, Henry Dennis, Halifax; Hodges, William Ashford, Wimbledon Park; Holland, Harry Dawber, Pemberton, near Wigan; Holmfeldt, Arnold Pearson, Hull; Holt, Harold Guy, Bolton; Huddart, Richard Melvil Fane, London; Hunter, Robert Cameron, Edinburgh; Iron, William Stanley, London; Jackson, Walter, Hitchin, Herts; Jaques, Sydney, London; Jennings, Daniel Strachan, London; Johnson, William Herbert, Great Yarmouth; Jones, Frank Henry, Leicester; Jones, Percy Charles, Leicester; Joynes, William James, Bristol; Kerr, Thomas, Inverness; Keys, Hubert Percy, London; Körner, Theodore Walter Frederick, Sunderland; Lambert, Arthur Peplow, London; Langham, Claude Stephens, Leicester; Le Gassie, Arthur Henry, Plympton, Devon; Linnell, Henry Rupert, Leyton; Lloyd, John Willott, Taunton; Lynham, Arthur George, Bristol; Macdonald, Donald, Muir of Ord, Ross-shire; MacGeorge, Archie Clair, London; Macmillan, Alec Lowe, Southport; MacRae, Ebenezer James, Edinburgh; Marshall, Frederic, Stockport; Matley, James, Oldham; Mitchell, Daniel, London; Mitchell, James, Edinburgh; Mitchell, William Henry, Sale, Manchester; Morland, Geoffrey, London; Morran, Henry Stanley, Plumstead, Kent; Murray, George Cumbe, Stoke, Devonport; Murray, Robert Howson, London; Newton, Percy Gerald, Kingstown, co. Dublin; Noël, Joseph Hyde, Wakefield; O'Connell, Vincent James, Dublin; Paice, William, jun., Egham; Pearson, Ernest Walter, Bradford; Petch, Ernest Scott, Wakefield; Phipp, Reginald Arthur Hyatt, Devizes; Pinsent, Cecil Ross, London; Prentice, Robert Russell, London; Pryor, Ernest Langman, London; Pursglove, Archibald, Heaton Moor, near Stockport; Rainger, Herbert Thompson, Cheltenham; Reid, James, Glasgow; Rigby, Alfred, Manchester; Robinson, Kenneth Duncan Stuart, London; Roe, Cyril Kenneth, London; Rowe, Percy John, Marlow-on-Thames; Saunders, Francis Southouse Morley, London; Scriveners, Alwynne Twyford, Stoke-on-Trent; Smith, John, Alnwick; Smith, Walter John, Richmond, Surrey; Snow, Alan Leslie, Chislehurst; Stenner, William James, Bristol; Street, Arthur William, Birkenhead; Sturgess, Alfred Dawson, London; Taylor, Charles Norman, Prestwich Park, near Manchester; Thomas, Charles Samuel, Swansea; Thomas, Hugh, Swansea; Thomas, Percy Edward, Penarth; Thompson, James Osbert, Poppleton, near York; Thorp, Ralph Windsor, Headingley; Thunder, Charles, London; Travers, Wilfrid Irwin, London; Vardy, Charles Alfred Silver, Maidenhead; Vaux, Norman, London; Vincent, Edwin Arthur Joseph Augustus, Chertsey; Wagstaff, Alexander, Glasgow; Walker, Ewart G., London; Walker, Frank Hugh, Windermere; Walton, William Billington, Blackpool; Webster, Frank H., Norwich; West, James Grey, Cardiff; Wilson, Edward Latham, Southport; Wood, George Arthur, Bradford; Woodcock, Richard Stanley, Aldeburgh-on-Sea; Wren, Edward Lancelot, Leicester.

Intermediate.

The following have passed the intermediate examination in

order of merit as placed by the board of examiners:—Messrs. P. B. Dannatt; J. S. Brocklesby; Baxter Greig; E. G. H. Gunn; A. G. Maitland, Tain, N.B.; W. Greenwood, Blackburn; J. H. Belfrage; R. T. Longden, Burslem; E. P. Archer; Edgar Quiggin, Liverpool; Herbert Ryle, Newcastle-on-Tyne; C. F. Callow, St. Leonards-on-Sea; Herbert Black; T. F. Amery, Sheffield; W. E. A. Brown; J. A. Fletcher, Leicester; W. J. Delbridge; Sydney Bridges; H. P. Gordon; H. E. Rider; G. E. Elkington; Richard Wylie, Gateshead; G. M. Page, Lincoln; H. M. Pritchard, Cardiff; J. O. Raymond, Tring; G. S. Salomons, Manchester; Jordan Green, Birmingham; F. G. Newton; F. J. Toop, Lincoln; W. E. Brooks; H. Dru Drury; E. H. Walker; F. J. Lucas; R. J. Archibald, York; A. F. Warth, Birmingham; W. P. Watson, Coventry; I. A. Hossack, Banff, N.B.; A. N. Campbell; Joseph Boyle, Bolton; H. F. Buckley, Halifax; F. J. A. Corfield; Bertram Drummond, Fleetwood; E. F. M. Elms; F. J. Forster, Darlington; E. T. Goff, Lowestoft; L. A. Loades, Morpeth; H. J. Mauchip, Bristol; Stanley Salisbury, Harpenden; J. H. Shearer, Exeter; W. H. Watkins, Bristol.

The following have passed the final examination, qualifying for Associate R.I.B.A.:—John Percival Bishop, London; Wm. Mackereth Dean, Gravesend; Lionel Gordon Detmar, London; Leonard Wm. Ensor, Huddersfield; Chas. H. Gage, London; Leolin Chas. Gregory, London; John Percy Hall, London; Sidney Joseph Halse, London; Alex. G. R. Mackenzie, Aberdeen; Clement Stretton, Leicester; Edgar John Pullar, London; Raymond Cyril Wrinch, Ipswich; Fredk. Dare Clapham, London; Wm. Bruce Dawson, London; Ernest Godfrey Page, London; Cyril E. Power, London; Thos. Wilson Aldwinckle, London; C. H. E. Bridgen, London; Dean John Brundrit, Cheshire; H. Cayley, Cambridge; H. D. Day, Godalming; T. Norman Dinwiddy, Greenwich; K. Gammell, London; G. R. C. Harding, London; Chas. Llewellyn Hall, Lancs.; Abraham Holstead, Alnwick; Edw. Vincent King, South Shields; Arthur Pickup, Blackburn; Louis Edw. Pryke, Surbiton; Arthur Henry Roe, London; Reg. Bertie Rowell, London; John Geo. Walker, Wakefield.

DRURY LANE THEATRE.

THE alterations which are now being carried out, from the plans of Mr. Philip Pilditch, at Drury Lane Theatre will have the effect of considerably improving the interior of the house by the time the autumn play is produced. The first and grand circles are being reconstructed in fireproof materials, and the timber beams, &c., replaced by steel girders, carrying a concrete floor, all the supporting pillars with the exception of a single row being done away with. In both these circles a new row of seats is to be added in front of those now existing, and this change, together with a rearrangement of the existing seats, will bring the total number of rows up to six in the grand circle and to seven in the first circle, the view from many of the seats being at the same time much improved. In the stalls, too, extensive alterations are being made. Two boxes on each side are to be abolished, and the space thus gained is to be filled with seats, two central gangways being constructed to facilitate ingress and egress. The accommodation of the stalls will in this way be increased by eighty-eight, to 462 in all. Improvements are also to be made in the remaining boxes on this level, and a new refreshment bar is to be added on the prompt side. Attention is also being paid to ventilation and heating, and a system has been adopted whereby electric fans pump in air, heated or cooled as may be necessary to maintain an equable temperature all over the house. To minimise the chance of the theatre being left in darkness owing to a breakdown or other accident, the wiring for the electric light is in duplicate, half the lamps being connected to the mains of one supply company and half to those of another, though, of course, there are switches which enable all the lamps to be fed from one supply if necessary. The cost of these changes, together with the redecoration of the house, is put at from 12,000*l.* to 15,000*l.*, a sum which brings up the total amount that has been expended on the theatre within quite recent years to 40,000*l.* or 50,000*l.*

THE TOTTENHAM EXCAVATIONS.

A LARGE party of the Essex Field Club on Saturday afternoon visited the excavations for the East London Water Company's new reservoirs at Tottenham and Walthamstow. When completed these reservoirs will double the storage capacity of the Company, raising it to 2,400,000,000 gallons. A locomotive, with three trucks fitted with seats, took the party over the bed of the reservoirs, and at various points Mr. Sharrock explained the engineering aspect of the

works, the diversion of the Lea from its old channel, and the formation of the new course. He mentioned incidentally that there was plenty of water in the river, and if the new reservoirs did not prove adequate it was proposed to construct others higher up the Lea Valley. The party then inspected the so-called Viking ship, which had been uncovered in what had been a backwater in the river channel at some period. The archaeologists of the party, however, were by no means satisfied that the ship had a rightful claim to anything like so high an antiquity, and it was considered that from 200 to 400 years was the greatest age that could be allowed. The discovery of fragments of coarse ware, certainly not earlier than the sixteenth century, in the same bed as the ship, and not far from it, supports this opinion. At this point Mr. T. V. Holmes, F.G.S., who knows the ground well, having visited it constantly during the last eighteen months, gave a practical demonstration of the shell marl and peat exposed during the course of the works, and pointed out evidences of the shifting character of the course of the old river. Another trip took the party to the offices, where in a shed near they saw the dug-out boat, about which there can be no doubt that it is Early British. It was found on a bed of fine sandy silt, mixed with fresh-water shells, apparently the bank of an old river. Within a hundred yards from it, and practically in the same bed, the workmen discovered several pieces of Roman pottery and a well-made iron spear-head. From the constant shifting of the river bed, due to floods, it would, however, be unsafe to lay much stress on this fact. It was hoped to secure this interesting relic for the Club Museum at Chingford, but the British Museum has established a prior claim.

THE HELLENIC SOCIETY.

THE annual meeting of the Society for the Promotion of Hellenic Studies was held on the 27th ult. Sir Richard Jebb, M.P., the president, was in the chair, and in opening the proceedings said that their past session had been one of satisfactory activity. It was especially gratifying to be able to record that the accession to the number of their members during the past year had been considerably larger than it had been in any recent year. They had long felt that there were many cultivated people in London and in the country generally who would probably be disposed to join the ranks of their Society if they were fully acquainted with its objects and with the advantages which it afforded, and it was very satisfactory to find that there was a tendency recently developed to a larger enlistment of new members. They had lost by death several distinguished members, including their honorary member Professor Kumanudes, of Athens. The name of Professor Rufus B. Richardson, director of the American School at Athens, had been added to the roll of honorary members in the place of Professor Kumanudes. They had also lost the Marquis of Bute, Dr. Creighton, Bishop of London, Dr. Stubbs, Bishop of Oxford, Professor Henry Sidgwick and other men of eminence, to whose memory they owed and rendered a tribute of gratitude for support and sympathy in the work of the Society.

Mr. George A. Macmillan, the hon. secretary, read the report of the Council, which stated that three general meetings had been held, and had been well attended. Special interest was excited by the meeting on February 28, when, through the courtesy of one of the honorary members of the Society, M. P. Cavadias, the Ephor-General of Antiquities in Greece, members had the privilege of hearing an account, illustrated by lantern slides, of the remarkable recovery of bronze and marble statues from the sea, off the coast of Cythera. Members would be aware that the excavations begun in Crete last year by Mr. Arthur Evans, working with the help of the Cretan Exploration Fund, and by Mr. Hogarth, as Director of the British School at Athens, led to discoveries of startling interest and importance. Mr. Evans himself described the remarkable Palace at Knossos, with its wonderful wall-paintings and hoard of inscribed tablets, at the annual meeting of last year, and fuller accounts had since appeared in the *Annual of the British School at Athens*, while other aspects of the subject had been dealt with in the valuable paper on "Tree and Pillar Worship," contributed by Mr. Evans to the last number of the *Journal of Hellenic Studies*. The extraordinary interest excited by these discoveries happily brought in contributions of upwards of 2,000*l.* to the Cretan Exploration Fund (including a second grant of 50*l.* from this Society), so that Mr. Evans was enabled to proceed with the further excavation of the site of Knossos, where his labours have already been rewarded with continued success, while Mr. Hogarth, working at Kato Zakro, on the eastern coast of the island, had discovered a Mycenaean town, containing within cyclopean walls a series of private houses in a remarkable state of preservation. At the same time Mr. R. Carr Bosanquet, the new director of the British School at Athens, had begun upon the site of Praesos,

at the eastern end of the island, excavations which were expected to yield valuable material for the study of the early civilisation in the Aegean, upon which the attention of scholars and archaeologists was now concentrated. There also interesting discoveries had been made, though belonging to a somewhat later period than was anticipated. The balance-sheet showed the present financial position of the Society. Ordinary receipts during the year were 1,039*l.*, against 960*l.* during the financial year 1899-1900. Sixty-two new members had been elected during the year, while forty had been lost by death or resignation. The present total of subscribing members was 747, and of honorary members twenty-three. Three new libraries had joined the list of subscribers, and three had stopped payment, making the number at the present time 142, or with the five public libraries, 147. On the whole, the general state of the Society might be regarded as highly satisfactory.

Mr. Arthur Evans's report from Knossos was then read.

Sir John Evans and Mr. Ernest Gardner also addressed the meeting, which then proceeded to the election of officers and council.

RELICS OF ANCIENT PARIS.

A SOCIETY exists, writes a correspondent of the *Glasgow Herald*, whose special function it is to preserve from annihilation vestiges and relics of the long ago or even more recent past. This association, called the "Société du Vieux Paris," was founded some time since, and is firmly supported by most of our archaeologists, as well as by intelligent Frenchmen, who hear with pain of the destruction of marks of civilisation left by our forefathers, whether very ancient or, relatively speaking, more modern.

Just now members of the Society are once more prominently before public notice. Their protective efforts have assumed an active form. St. Denis, the outskirts of the capital so rich in historic souvenirs, is the battlefield. A plot of ground on which an old church called "Les Trois Patrons" once stood is fraught with interest for archaeologists. It has long been thought that excavations would bring to light many valuable remains of the past, and a little more than a month ago the Société du Vieux Paris decided to dig the ground.

The work has gone on steadily, and the yield in the shape of relics, very valuable both from an historic and archaeological point of view, has been already abundant, the prevailing impression being, moreover, that there is a good chance of discoveries of yet greater general interest.

Amongst the things brought to the surface are a quantity of pottery, believed to be of exceedingly ancient date, some of which, however, is in an excellent state of preservation. Then we have jewels, and amongst them a Merovingian brooch set in gold of really exquisite workmanship, the design thereof displaying a certain knowledge of the jeweller's art. In the centre is a beautiful sapphire, surrounded with four large amethysts, the interstices being filled with rubies and clear yellow amber. Another find is a finely-chiselled *agrafe*, equally in gold; another a belt buckle artistically carved in copper. Tiles, a Frankish lance, a quantity of vases of all shapes and sizes have also been unearthed, as well as a piece of gold money cast under Philip the Bold, Duke of Burgundy, in the middle of the fourteenth century. This latter find is so bright and unused that it might have been struck yesterday.

On the ground itself all manner of things meet the eye and interest the lover of relics of bygone centuries. Sculptured stones lie here, piles of human bones or imperfect skeletons there and a variety of objects calculated to interest the antiquarian. The committee of the Society had, up to the present, deposited all that was found in the shop of a furniture maker of the locality, believing them to be in perfect safety. The event, however, was nearly proving the unwisdom of this proceeding. An attempt has just been made to sack the place, and though it happily turned out unsuccessful, the alarm was sufficient to cause the removal of the relics to a place of greater security.

The desire of the Société du Vieux Paris is to continue the excavations which have already led to such interesting discoveries. But it so happens that the ground belongs to a practical-headed business man, whose ambition it is to build a five-storey tenement house on the site of the ancient church. Evidently, since the ground is his he can do what he lists with it, and, being apparently profoundly indifferent to relics of the past or "rubbish" ancient historic souvenirs, he seems disinclined to waive his right to run up a modern dwelling-house on the spot dear to our archaeologists. The latter, however, are appealing to the local magnates of St. Denis, urging that the site where the ancient church stood should be purchased, if its owner will consent, and a museum be built thereon at the expense of the town, in which articles discovered in St. Denis or the neighbourhood could be placed. The plan has evidently much to be said in its favour, but the practical

headed tradesman bids fair to be a difficult customer. So, for the present, no solution has been reached. Most certainly since this Société du Vieux Paris has been founded it has rendered sterling service in its own particular line by protecting relics of the past from destruction.

A species of sister society, it may be mentioned, was formed not long ago with the object of protecting interesting sites and monuments in France from the vandalism of the multitude. It is well known that tourists, especially of the lower class, have an inveterate and incorrigible liking for cutting or chipping their names on any historic site or monument they may chance to visit whilst on a holiday. Brittany, it appears, so rich in interesting souvenirs, has suffered to an extraordinary degree by the habit, and this in spite of the efforts of appointed guardians or of notices posted up begging visitors to respect the place. Members of the society for the protection of sites and monuments from acts of vandalism have sought to interest legislators in their mission. Measures, it is said, are to be studied for preventing Jean or Jacques and their womankind, whether of French or foreign extraction, from handing down to posterity the date of their visit and other personal particulars by chipping these interesting items on monuments erected to perpetuate the memory of some glorious deed in the history of France.

TESSERÆ.

Local Characteristics in Paintings.

WHEN we think of the celebrated personages of sacred history we have little thought of their local character, but regard them as typical of human nature in general rather than of any particular race; and the clinging tenderness of Ruth, or the lofty courage of Judith, can be fully imparted to a face without insisting on any peculiarity of feature in the nation to which they belonged. Take, for instance, one of those gorgeous supper scenes painted by Paul Veronese; whatever dissatisfaction is felt on looking at the picture arises from the absence of divinity in the representation of Our Saviour or of any other sacred character introduced, rather than from a want of attention to local truth. By the introduction of Jewish men and women in lieu of Venetians he might have imparted a more correct idea of the locality of the scene, but most certainly what he might have gained thereby in truth he would have lost in beauty. Perhaps the most satisfactory representation of Our Saviour as man is that painted by Titian in a picture called "The Tribute Money," now in the gallery at Dresden. The elevated character of the face with its solemn and sorrowing expression go far to realise our idea of that divine personage, and yet, no doubt, it was painted from a Venetian, for it has no resemblance to the peculiar character of the Jewish race; and, as an eloquent writer has truly observed, he who cannot paint a Madonna from an Englishwoman could scarcely hope to succeed were he to ransack the whole world of Jewry for a model. This strict attention to local truth is, therefore, of no real assistance in imparting grandeur, nor can it be accepted as a token of high ability. For all great work in every art, rejecting the feeble tribute of delight or curiosity, produces a mysterious feeling akin to awe, and so absorbs the mind as to make it forgetful of that particular art which is the immediate object of contemplation. It appeals by its whole and not by its parts, every quality contributing its proper force to the unfolding of the artist's conception.

Lombardie Columns.

The capital was larger in proportion to the rest of the column, thereby affording a greater surface or impost for the arches to rest upon, and also combining the appearance of security at that point with general lightness of appearance. The shaft was mostly plain, yet frequently highly ornamental, striated or carved in different ways, and sometimes twisted, either singly or with two stems twining spirally around each other. Columns furnishing examples of all these different modes occur in the cloisters of San Paolo and San Giovanni Laterano at Rome, and the capitals present quite as much variety, it seeming to have been the aim on such occasions to introduce as much diversity as possible, instead of so arranging the columns as to have two of the same kind placed together, a practice probably originating in making use of columns and fragments taken from other buildings, and afterwards retained as conducing to variety and richness. Although the arches were, as frequently as not, quite plain, and without archivolt mouldings of any kind, the use of archivolts was by no means uncommon, sometimes consisting of merely a single moulding enclosing a plain border around the arch, at others divided into *faciæ*, and more or less enriched, as in the front of the cathedral of Pisa, in which building the arches describe more than a semicircle above the capitals of the columns, being prolonged downwards by a deep abacus, consisting in some places of two, in others of a single plain block resting immediately on the capital, a mode certainly preferable to that

of placing a mere lump of entablature upon the column, and not ungraceful in itself, because it gives greater height and importance to the arches, which being narrow would else appear stumpy, depressed and overloaded by the ornament around them. Similar blocks or abaci occur in the remains of Frederick Barbarossa's palace at Gelnhausen, where small heads or masks are introduced immediately above such abaci, so as to fill up the space there between the arches, and continue in some degree the vertical lines produced by the columns.

Roman Afforesting.

Rome was full of sacred woods (*luci*) which had been planted evidently for reasons of public health, and it is very interesting to take an accurate note of the places where these woods were to be found. There is a plan of ancient Rome, taken by an engineer from Perugia, whose name was Agretti, from which we may learn that there were not less than 44 "*luci*" in the interior of the town. A copy of this plan is to be seen in Perugia, and it is considered one of the most remarkable works on the subject. These "*luci*" are:—The Vatican "*lucus*," of which Pliny speaks; the Aventine "*lucus*"; the "*lucus*" of Vesta, on both sides of the Velabrian Marsh; the Mavortian "*lucus*" around the Palus Caprea, near the Pantheon; the Esquilian "*lucus*," near the Flavian amphitheatre; the "*lucus*" of Bellona; and the "*lucus Tarpeius*" on the Capitol, and many others which are to be seen in the above-mentioned plan. All these woods of a religious character had been certainly planted in order to render more healthy the different parts of the town. We must notice that the Romans, instead of draining the marshes, surrounded them with trees, because they thought that vegetation would absorb every miasma. The fact proved they were right, and we really do not know of any Latin author speaking about malaria in Rome.

GENERAL.

Messrs. Doulton & Co., Ltd., have been appointed by Royal warrant potters to His Majesty.

Mr. Robert Wilson, architect to the School Board of Edinburgh, died a few days ago from pneumonia.

Mr. W. Vaughan, who for nineteen years has been chief architectural assistant to the Bradford Corporation, has been recommended for appointment as architect to the Bradford School Board. There were sixty-four applications.

The Tomb of Adelaide of Savoy, wife of Louis VI. and afterwards wife of Mathieu de Montmorency, has been discovered at Montmartre on the site of the abbey founded by her. The tombstone, though mutilated, answers to contemporary descriptions of it.

Sir Alexander Binnie, chief engineer of the London County Council, has resigned his position, in order to follow the private practice of his profession. The resignation is to take effect on December 31 next.

The Art Loan Exhibition of works of Spanish painters at the Guildhall, it is proposed, with the consent of the owners of the pictures, to keep open until Wednesday, the 28th prox.

A Mortuary Chapel is to be erected at Hawarden Church, and will contain an altar tomb bearing the recumbent figures of Mr. and Mrs. Gladstone, which Sir William Richmond will execute. A faculty is to be applied for to make the necessary alterations to the fabric of the church.

The Late Mr. John Kirby has bequeathed on the death of the survivor of his daughters a sum of 3,000*l.* to be held on trust to partly apply the income to the repair of the stained-glass windows, reredos and monuments in the church of St. Mary, Wallingford, Berks.

The Northern Architectural Association will go tomorrow, July 6, to Edinburgh for their annual excursion meeting.

The Worthing Town Council have rejected after a long discussion a scheme for the introduction of electric tramways in the borough.

The Horniman Museum and Park were formally accepted on Saturday by the London County Council, to be for ever dedicated to the use of London. The building containing the collection has cost 40,000*l.*

The London County Council, at a conference with representatives of the Metropolitan Borough Councils, passed a resolution "that it is desirable, with a view to avoiding dual control and overlapping expenditure, that no scheme for the housing of the working classes in any metropolitan borough should be promoted by either the London County Council or the Council of any metropolitan borough pursuant to Part III. of the Housing of the Working Classes Act, 1890, except after due consultation between the two Councils (a) as to the desirableness of the scheme, and (b) in order that the cost of such scheme may be fairly apportioned between the county and the particular borough."

THE Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

ANSWERS TO CORRESPONDENTS.

DISMISSAL OF ARCHITECT.—The answer to your query depends upon the terms of the engagement; but, in the absence of any agreement to the contrary, the architect cannot be summarily dismissed in the middle of a contract unless guilty of gross misconduct or incompetence. You have given us but few particulars.

COMPENSATION (Country Landlord).—The Act came into force on the 1st instant, and extends the Workmen's Compensation Act to agricultural labourers—an expression which is widely defined in the Act.

COMPETITIONS OPEN.

BEXHILL.—July 13.—Competitive designs are invited for erection of a chapel in the Bexhill cemetery. The total cost of such building is not to exceed 800*l.* A premium of 10*l.* is offered. Mr. E. Sholto Douglas, clerk, Town Hall, Bexhill.

CHELSEA.—Oct. 1.—Competitive designs are invited for proposed new baths in King's Road, Chelsea. Premiums, 100 guineas, 50 guineas and 30 guineas respectively. Particulars at the office of the committee, 171 King's Road, Chelsea.

MANCHESTER.—July 31.—Competitive drawings are invited for a fire station, a police station and other buildings, to be erected on land abutting upon London Road, Fairfield Street, Commerce Street and Whitworth Street, at a total cost not exceeding 85,000*l.* Premiums of 300*l.*, 200*l.* and 100*l.* Lithographed plan of site and copy of conditions may be obtained on application to the City Treasurer, Town Hall, Manchester.

PENZANCE.—Sept. 1.—Competitive plans and estimates are invited for laying-out ground situate on the Western Promenade, to include a winter garden suitable for band and other concerts, and lavatory accommodation for ladies and gentlemen. Premiums of 21*l.* and 10*l.* 10*s.* respectively are offered for the best and second best designs. Mr. T. H. Cornish, town clerk, Public Buildings.

CONTRACTS OPEN.

ARGENTINE REPUBLIC.—December 10.—For construction of harbour works at Rosario. Particulars can be obtained at the Commercial Department Foreign Office, S.W., on personal application.

ATHERTON.—July 18.—For erection of public swimming and slipper baths at Atherton, Lancs. Mr. F. H. Grimshaw, surveyor, Atherton, Manchester.

BEDFORD.—July 6.—For erection of a shelter at the Bedford cemetery. Mr. Henry Young, architect, Bedford.

BIGGLESWADE.—July 6.—For erection of new showrooms at Biggleswade, Bedfordshire, for Messrs. Maythorn & Son, coach-builders. Mr. Twelvetrees, architect, Sandy.

BIRKDALE.—July 10.—For erection of walls at the cemetery at Birkdale, Lancs. Mr. J. Smallshaw, clerk, Town Hall, Birkdale.

BIRMINGHAM.—July 8.—For construction of the approaches and bridge over canal. Mr. John Price, city surveyor, Council House, Birmingham.

BLACKBURN.—July 22.—For extension of the electricity works, Jubilee Street. Mr. A. S. Giles, borough electrical engineer, Jubilee Street, Blackburn.

BRIDGWATER.—July 8.—For alterations and additions to the school premises at Mount, Bridgwater. Messrs. Samson & Cottam, architects, Bridgwater.

BRIGHTON.—July 9.—For internal and external repairs, painting, &c., at the Board schools. Messrs. T. Simpson & Son, surveyors, 16 Ship Street, Brighton.

BRISTOL.—July 8.—For completion of the church of St. Thomas, Eastville. Mr. H. C. M. Hirst, architect, 30 Broad Street, Bristol.

BURNLEY.—For erection of a club and reading-room at Holme, Cliviger, near Burnley. Mr. J. C. Wilson, 168 Todmorden Road, Burnley.

BURNLEY.—For erection of a dwelling-house and shop at Walk Mill, Cliviger, near Burnley. Mr. James C. Wilson, 168 Todmorden Road, Burnley.

CARLISLE.—For additions to a house near How Mill. Mr. T. Taylor Scott, architect, 43 Lowther Street, Carlisle.

CATERHAM.—July 22.—For alterations and additions to the laundry at Caterham Asylum. Mr. T. Duncombe Mann, clerk, Asylums Board, Embankment.

CHESTER.—July 13.—For erection of shedding, tents, canvas and other works in connection with the annual exhibition of the Cheshire Agricultural Society, to be held on August 28 at Chester. Mr. Thomas A. Beckett, secretary, St. Werburgh's Chambers, Chester.

STURTEVANT

SYSTEM OF Warming & Ventilating.

STURTEVANT ENGINEERING COMPANY, LD.,

147 QUEEN VICTORIA STREET, LONDON.

GLASGOW, PARIS, BERLIN, STOCKHOLM, MILAN, AMSTERDAM.

CHIPPENHAM.—July 10.—For erection of a steam laundry at Chippenham, Wilts. Mr. Francis Stacey, clerk to the Chippenham Sanitary Laundry Company, Ltd., St. Mary's Street, Chippenham, Wilts.

CHURCH COPPENHALL.—July 13.—For erection of cloak-room accommodation at the girls' and infants' schools, Church Coppenhall, Cheshire. Mr. C. E. Speakman, clerk to the School Board, 1 Coppenhall Terrace, Crewe.

CLECKHEATON.—July 6.—For erection of Lancashire boilers, economiser, jet condenser, feed-pumps, suction-pumps, Meldrum's destructor furnaces, balancers and boosters, accumulators, cables, switchboards, travelling crane, &c. Messrs. Gibbings & Baker, Piccadilly Mansions, 17 Shaftesbury Avenue, W.

CLEETHORPES.—July 8.—For erection of an eight-stall stable, granary, stores, offices, cartshed, steam-roller house, &c. Mr. Egbert Rushton, surveyor, Poplar Road, Cleethorpes.

CLEVEDON.—July 11.—For erection of a steam laundry. Mr. T. J. Moss-Flower, 28 Baldwin Street, Bristol.

CLITHEROE.—July 8.—For arching the brook adjoining the Board school premises at Sabden, Clitheroe, Lancs. Mr. Thomas Rawcliffe, surveyor, Bradhurst, Aighton, near Whalley.

COLCHESTER.—For pulling-down and rebuilding premises at the corner of St. Botolph's and Osborne Streets. Messrs. Goodey & Cressall, architects, Victoria Chambers, Colchester.

CORNWALL.—July 16.—For alterations at Gulval Cross Board school. Mr. T. H. Cornish, clerk, 8 Parade Street, Penzance.

DISTINGTON.—July 9.—For erection of a house at Distington, Cumberland. Mr. Jefferson Brough, Black Lion, Distington.

DONCASTER.—July 8.—For erection of four cottages at West Street, Hexthorpe. The Secretary, Workmen's Club and Institute, 2 Langer Street, Hexthorpe.

ERITH.—July 15.—For construction of engine and boiler-house, chimney-shaft, sanitary work, water and fire services, rain and surface-water drains, approach roads for the new electric-light station. Mr. Charles H. Fry, clerk, District Council Offices, High Street, Erith.

EXETER.—For erection of a new roof over a portion of the Old Quay Foundry and Engine Works, Commercial Road.

Mr. J. Archibald Lucas, architect, Guildhall Chambers, High Street, Exeter.

FINCHAM.—For erection of a Primitive Methodist school-room at Fincham, near Downham, Norfolk. Mr. T. H. Barker, Fincham.

FINSTHWAITE.—July 13.—For erection of a dwelling-house. Mr. John Coward, Stott Park Mill, Lake Side.

GLOUCESTER.—July 8.—For erection of four cottages and messroom at the docks. Mr. Walter B. Wood, architect, 12 Queen Street, Gloucester.

HALIFAX.—July 6.—For erection of a pair of semi-detached villas on the Greenroyd Estate, Skircoat. Messrs. Richard Horsfall & Son, architects, 22 Commercial Street, Halifax.

THE new educational buildings which have been erected by the County Councils of the East and West Ridings of Yorkshire, on the Manor Farm at Garforth, were opened on the 28th ult. by Earl Spencer, K.G., Chancellor of the Victoria University. The buildings are intended to serve a double purpose. In the first place they contain lecture-rooms and laboratories for students taking the course of instruction given in the Agricultural Department of the Yorkshire College; and, secondly, they provide a practical dairying school, equipped on the most modern principles.

FISHBURN'S LABOUR SAVING WINCHES

The Machine is so named because of its adaptability as a means of lifting or lowering articles and materials of every kind with great despatch and safety.

By its use in Building operations ordinary Wheel-barrows, Hand-barrows, Baskets, Buckets, or other receptacle, being used, the loaded one ascends while the empty one descends, and at a great saving in the cost of labour.

AN INTERESTING CELEBRATION.

SOUTH YARDLEY, Birmingham, was on the evening of Tuesday, the 25th ult., the scene of high revelry in celebration of the coming of age of Mr. S. Hanson Rowbotham, the only son of Mr. and Mrs. Thomas Rowbotham, of Gilbertstone Grange, who entertained a large number of friends at a ball which they gave in honour of the event. Mr. Rowbotham, jun., who received his education at King Edward's School, Birmingham, and the King's School, Warwick, is now engaged in superintending the large building contracts being carried out by his father for the Greenwich Union, at contract figures amounting to some 300,000l. His early training for entrance to the building trade took place under the direction of Mr. Henry Martin and Mr. W. H. Bidlake, M.A., two of the best-known members of the architectural profession in Birmingham.

A commodious and elegantly decorated ballroom and supper-room were erected in the beautiful grounds of the Grange, and the grounds themselves were profusely illuminated with Vauxhall lamps and Japanese lanterns, the whole producing a charming effect. The company included Alderman Ash, J.P., Mr. G. Beech, J.P., and Mrs. Beech, Mr. Beech, jun., and Miss Beech, Mr. William H. Bidlake, M.A., County Councillor T. R. Bayliss, J.P., and Mrs. Bayliss, Mr. and Mrs. T. A. Bayliss, Mr. Joseph Boston, J.P., and Mrs. Boston, Mr. and Miss Boston, Mr. and Mrs. Butler, Mr. Howard Bates, the Misses P. and N. Bosworth, Mr. and Mrs. F. Briely, Mr. and Mrs. B. Corser, Mr. and Mrs. C. Chambers, Mr. and Mrs. Caudelent, Mr. E. and Mrs. Docker (Droitwich), Mr. and Mrs. Dumolo, Captain Norman Dinwiddy (London), Mr. J. A. and

And every available example of Celtic Art.

The wonderful durability of IRISH LIMESTONE is well-known.

Mrs. Dexter, Mr. and Mrs. W. H. Duffield (Beckenham), Mr. and Mrs. A. Edwards, Mr. and Mrs. William Frazier, Mr. E. V. and Mrs. Fletcher, Miss Marie Frazier, Mr. S. Jenkins, Mr. W. A. Jones (London), Mr. and Mrs. F. Moore, Mr. and Miss Griffiths, Mr. C. and Mrs. Holder and Miss Holder, Miss Ettie Hill, Mr. and Mrs. William Johnson, Mr. F. Jefferson, J.P., and Mrs. Jefferson (West Bromwich), Mr. William Kendrick, Mr. Fred. M. Lea, Mr. G. T. Martin, Mr. and Mrs. H. Martin, Mr. and Mrs. F. Mundy, Councillor R. C. Marsh, Mr. and Mrs. E. Mallard, County Councillor J. J. R. Mogg, J.P., Mrs. and Miss Mogg, Mr. G. Muscott, J.P., and Mrs. Muscott, Mr. Roland Muscott, Mr. G. W. Merrett, the Misses Maud and Frances Merrett, Mr. Moakes, Mr. E. O'Brien, Dr. Oakes, Mr. F. H. Pepper, Mr. E. Stanley Patterson, Mr. and Mrs. Thomas H. Pearce, Miss Rowbotham, Mr. and Mrs. Jacob Rowlands, Miss Rowlands, Mr. and Miss G. Rooker, Sir James and Lady Sawyer, Mr. and Mrs. William Sapcote, Mr. and Mrs. T. Spencer (West Bromwich), Mr. J. Tozer and Miss Tozer, Mr. and Mrs. E. Wood (West Bromwich), Mr. and Mrs. James Upton, Mr. and Mrs. T. W. Willard (Rugby), Mr. and Mrs. F. E. Wattis (Solihull), Mr. and Mrs. Wigley, Captain Z. Walker, J.P., and Mr. Whitfield.

After supper Mr. Enoch Wood proposed, in felicitous terms, the toast of the evening, to which Mr. S. H. Rowbotham appropriately replied, his speech being enthusiastically received. Dancing was afterwards resumed, and continued till a late hour. Mr. Rowbotham, jun., was, it is hardly necessary to say, the recipient of a large number of costly presents and congratulations innumerable.

W. & R. LEGGOTT, LTD.

THE high quality both as regards material and workmanship which Messrs. W. & R. Leggott put into the door and window furniture manufactured by them is too well known to need enlarging upon here, and in their new showrooms at 90 and 91 High Holborn may be seen a thoroughly artistic display of such goods, the design and finish of which reflect the greatest credit on, and amply justify the high reputation enjoyed by, the firm. Among the locks we were much struck by one specially designed for hospital or asylum purposes, its peculiarity being that it is operated by four different keys, one of which applies to only one lock, a second applies to all the doors of a corridor, the third to a whole building or block and the fourth controls all

the locks in a group of buildings, or, in other words, the entire institution.

Another specialty of Messrs. Leggott's which deserves mention is their patent "Rojon" door spring and check, of which the principal feature is a movable cam mechanism, which prevents sudden jerks and straining of the spring.

When the door is wide-open the spring is only wound up sufficiently to allow the door to close, keeping a large reserve power. The atmospheric check is made on the most approved principle. By a special slide arrangement the pivot lever is always connected with the check and ready to operate when the door is released. The spring is encased in an iron cylinder,

This spring is made on entirely different principles to other springs in the market, and Messrs. Leggott claim that it has a considerably longer life.

NEW CATALOGUE.

IT must have often puzzled visitors to understand how the extensive business of Messrs. C. C. Dunkerley & Co., Limited, Manchester, could be conducted in comparatively limited premises. System can do much, and besides, it is difficult to obtain an area of land sufficiently large for a warehouse of iron and steel, for business of the kind must be mainly conducted on the ground floor. At length, owing to the increased demands, it has been necessary for the firm to remove to specially designed warehouses in Store Street, Manchester. Accommodation can at last be found for the immense stock of iron and steel in all the forms required in construction. An equal number of pieces of wood would form a well-stocked timber yard. The impression made on entering the various divisions is that iron and steel are now the principal materials employed by builders. It is not merely steel joists of all sizes, bar iron, angles, channels, tees, sheets, but compound girders, stanchions, columns and rivetted girders. Fairbairn and other pioneers of metallic construction would be amazed at the variety of forms in which steel and iron are displayed at Store Street by Messrs. Dunkerley. The guide to the present stock is issued in a handy form, is illustrated by sections, and gives weights and safe loads. There must be few sections in use which are not found in stock, but the firm will supply any existing section "from works." The removal enables Messrs. Dunkerley to introduce a new department in which rivetted girders can be produced and prompt completion and delivery are assured.

No little excitement was caused at Liverpool on Tuesday owing to a leakage in the electric-lighting main placed underneath the footwalk. The apparatus for regulating the currents in Dale Street somehow became detached from the main and set up a current on the pavement, causing persons who passed the spot to cut queer capers when they received a shock, which was rendered more severe by the rain. Several were knocked down, but no serious injury is reported.

TRADE NOTES.

THE New British schools, Halesowen, are being ventilated by Mackay's patent direct-acting ventilators, supplied by the sole makers, Messrs. Cousland & Mackay, ventilating engineers, Glasgow and Manchester.

MESSRS. RIPOLIN, LTD., of 110 Fenchurch Street, ask us to mention that the enamel used for painting the walls of the new operating theatres at St. Thomas's Hospital, to the opening of which by Lord Lister we referred last week, is their white Ripolin paint.

PAPRISTEEL is the name given by the General Electric Company, Ltd., to a new electric conduit manufactured of paper tube drawn over with their "Union" steel conduit, the whole being enamelled inside and outside, and stoved together, thus forming a highly insulating, damp-proof and mechanical protecting conduit. It is claimed that the "Papristeel" conduit effects a large saving in cost over insulated steel or gas barrel conduits, and at the same time combines all their advantages with those of the company's "Union" system. When it is desired to have screwed joints, this conduit can be supplied at a slight additional cost with the lengths screwed at each end, in such case the screw being of brass pitch so as to fit the lampholder, couplings or other similar fitting.

VARIETIES.

THE Institution of Junior Engineers will on Saturday, July 13, at 3 P.M., visit the Millwall Lead Works, Millwall.

A NEW Wesleyan chapel, which cost 1,000*l.* exclusive of site, was opened for Hethersgill, in the Brampton circuit, on the 27th ult.

LORD DUNDONALD visited Winsford, Lancs, on the 26th ult., to open a new Drill Hall which has been erected at a cost of 3,000*l.*

A NEW United Methodist Free church, which has been erected in Tipton Street, Lower Openshaw, for the congregation which has met hitherto in the Cobden Memorial Hall, was opened on Saturday afternoon.

THE new police court and station at Howden, which have been built by the East Riding County Council at a cost of something like 4,000*l.*, were on Saturday formally opened for public business. The new structures are commodious and

effective, and occupy a prominent position in the centre of the town. They are built of red bricks with stone facings, and are of a substantial character.

BUILDING AND BUILDERS.

FOUNDATION-STONES have been laid of a church at Sudbury to cost 2,500*l.* and seat 400.

It has been decided to reroof Holy Trinity Church, Coventry, at an estimated cost of 1,750*l.*

THE new chapel of the United Methodist Free churches, Lower Openshaw, Manchester, was opened on Saturday.

THE foundation-stone of a new chancel which is being added to St. John's Church, Sevenoaks, was laid on the 24th ult.

AT Cuddington, near Northwich, foundation-stones were laid on the 26th ult. of a new Sunday school and an extension of the present United Methodist Free church.

To perpetuate the memory of Queen Victoria, it has been decided to restore the parish church at Baston, South Lincolnshire, and the suggested improvements include a new clock in the tower.

ON Saturday a new Baptist chapel in Beaver Park, Didsbury, was opened by a dedicatory service. The present building consists of nave, transepts and chancel, with provision on the site for vestries and a school yet to be erected. The design also includes a tower, which can be added at the north-west corner, and which will provide access to the end gallery. The accommodation on the ground-floor is for 450 persons, but for the present the nave alone will be used for services, accommodating 200. The architect is Mr. A. W. Smith, and the contractors Messrs. J. Gerrard & Sons.

REVERSIBLE CASEMENT WINDOWS.

A JUDGMENT was delivered on Monday, June 24, by Judge Lawrance at the Essex Assize Court, Chelmsford.

The plaintiffs were George E. Clare, architect; E. Wareham, watchmaker; and S. Upshall, agent, all of Chelmsford; and the defendants The Crittall Manufacturing Company, Limited, of Braintree, Essex. The action was for the recovery of 50*l.* due and damages for breach of the contract under an agreement made with the defendant company in October 1898.

Mr. J. F. Rawlinson, K.C., and Mr. C. E. Jones, instructed by Mr. A. G. Maskell, solicitor, of Chelmsford, in opening the case for the plaintiffs, said they were the inventors of a patent reversible casement hinge, which device was developed in October 1896. It consists of a stiff vertical bar with horizontal arm at top and bottom, integrally joined together so as to become one strong rigid [-shaped appliance, which is hinged at the side to the frame and at the end of the arms to the centre of the top and bottom rail of the casement, in order that the casement can be opened in the usual way on the side hinges for ventilation, and by releasing a catch reversed on horizontal arm hinges. The object of the device was to enable outward opening casements and those on either side to be cleaned from the inside, and thus avoid the window-cleaning accidents that were so frequently occurring. A model of the invention (produced in Court) was taken to the Crittall Manufacturing Company on October 13, 1896, and the manager was much taken with the idea. After some negotiations a provisional agreement was drawn up by which the defendants obtained the sole right to manufacture under certain royalties, and the plaintiffs received 50*l.* down, the defendants agreeing to pay another 50*l.* when the final specification was produced with an expert's opinion as to validity. Upon searching the patent records the plaintiffs found that other devices had been previously patented, one by Rump, a German, and another by Osterberg, an Austrian. The latter failed to complete his English patent, and it therefore became public property in this country. Although these two inventions (which are virtually the same) are somewhat similar in appearance to the plaintiffs' device they both lack the important and vital element of the plaintiffs', viz the strong vertical bar connecting the two arms, making the three one homogeneous whole that renders it of practical utility and a success commercially; whereas the lack of this in the other two rendered them both quite useless for any practical purposes. In January 1899 defendants suggested that the matter should come to an end; in July 1899 plaintiffs obtained the final specification, and produced Mr. Bousfield's, K.C., report, stating that in his opinion Clare's patent was not an infringement of any other patent.

In June, 1899, the defendants advertised the casement widely, and called it the "Crittall safety casement," and up to the present time had been manufacturing to Clare's specification; some marked Rump's patent and some not marked at all. Counsel produced various models of the different inventions, and called Wareham, who explained the models and

demonstrated the difference between plaintiffs' device and those of Rump and Osterberg. Evidence was also given by Mr. George Barker, patent agent and consulting engineer, Birmingham, and Mr. Dunn, A.R.I.B.A., architect, of Birmingham, who both confirmed Wareham's evidence, and explained the reason why the plaintiffs' device was a success and the prior patents not, Mr. Dunn stating further that he was so pleased with the plaintiffs' patent that he would be pleased to specify it where he could. The jury at this juncture expressed the opinion that no further evidence was needed on that point, as they were convinced.

Mr. J. A. King, agent for the Mack slab, of Queen Victoria Street, London, was then called to prove that he, with Mr. C. A. Line, of Birmingham, had seen the Crittall Manufacturing Company's stand at the Building Trades Exhibition this year, and their representative had told them that they had tried to make the casements satisfactorily without the vertical connecting bar, but that they had found the vertical bar was absolutely indispensable; this fact was further borne witness to when Mr. Crittall stated that the only casement he had made without it was one in his own shop.

Mr. Johnson, builder, of Chelmsford, then gave evidence of having seen many of the casements made and fitted up by the defendant company in buildings in London, all in his opinion without a doubt according to plaintiffs' specification; he further alleged that he should be pleased to use the plaintiffs' patent casement wherever possible, but Rump's he would certainly not use unless he was compelled to.

Messrs. Clare and Upshall subsequently gave evidence in support of the previous witnesses.

Mr. Witte, K.C., for the defendants, submitted there was no case for plaintiffs, and that the validity of plaintiffs' patent was not proved.

Mr. F. H. Crittall, managing director for the defendants' company, said he went to Hamburg in May 1899 and entered into an agreement with Rump to acquire the sole right to manufacture his patent, and since then he had done so; but he admitted that casements had been fitted that were not marked Rump's patent, which he regretted.

Mr. Brunton, manager for Messrs. Crompton & Co., Chelmsford, witness for the defendant company, stated that superficially the casement from defendant company was like plaintiffs' patent, but in principle it was Rump's.

The jury at once decided that plaintiffs' patent was the best they had seen in Court, was practically useful, and that it was a

valid one; and that defendants had been working under plaintiffs' patent.

The judge gave judgment for the plaintiffs for 50%, with costs, and ordered an account to be furnished to plaintiffs. Stay of execution for ten days was granted.

THE VENTILATION OF HOUSES.

At a meeting of the sanitary inspectors of Scotland Mr. James M. Rose, Sutherland, read a paper on "Bionomical v. Artificial Ventilation." He said that it was admitted by all that the best, most useful and substantial inventions were the simplest ones. Science and art had done wonderful things, but in comparison with some of the other organic and inorganic elements they had done very little to make air more serviceable. Even in the twentieth century we were further back in our knowledge of the principles that governed the first necessity of life than in almost anything else. In the latter part of the past century we had acquired some knowledge in meteorology and allied studies, and it was to this science that we must look to to get some facts and data to go on in dealing with any application of these elements to such an important matter as ventilation. The number of systems and appliances at present in use for ventilating houses and buildings were legion. A few of them worked fairly well, especially those that had the aid of machinery and the elaborate system in use in the Houses of Parliament. These expensive and elaborate systems were but compromises on account of our lack of knowledge of the simple laws that guided natural ventilation in the outside world, and of having that principle adopted intelligently in the ventilation of houses and other buildings. There were, he said, a host of small contrivances which were more or less useless, and their only recommendation was the art displayed in their construction. Mr. Rose explained the action of the air blowing from the equator to north and south, and then went on to say that every person knew that the higher up they went the temperature got lower, and the nearer to the earth the higher the temperature. Hence the old saying, "Keep your feet warm and your head cool." That was the natural order of things; but in 99 per cent. of the dwellings they would find the temperature 40 degrees on the floor and 60 or 70 degrees from 6 feet up to the ceiling. For a considerable time a fierce controversy had been raging over this

THE CORBIN LIQUID DOOR CHECK & SPRING

(The Latest and Best from America).

It Prevents Banging, but Latches the Door.

Right Hand.

IS REPLACING OTHER CHECKS EVERYWHERE, and is being Specified by Architects for Board Schools, Public Buildings & Private Houses, BECAUSE

It is quicker and more positive in action, reducing the draught to a minimum.
It never allows the door to bang.
Main Working Parts are Dust-Proof, and They never require Oiling or even cleaning.
Perfect regulation of Speed.
Absolute regularity of action.
The Liquid forming the check to the Spring is composed of ingredients not affected by extremes of temperature.
Superior design, construction and appearance.
Patented everywhere.
Will work for years without attention.
Simple provision for taking up wear of joints after very long use, again making the check as good as new.

Also Holders for Spring Doors & other Specialties

question of ventilation. A few of the more recent systems were certainly improvements, because of their ability to change the air in confined areas, but these were only within the reach of the very wealthy, and could only be introduced into large halls, hospitals, and similar places. What was really required was a greater approach to the principal law of the universe, which was both simple and procurable at a cost within the reach of every builder of a house or a tenement. First of all, they must be prepared to sacrifice their good old friend the common grate and open fire-place in living and sleeping rooms, and substitute a small stove that would not consume more than a few pounds of coal, or its equivalent, in, say, three or four hours. The stove would have a heat radiating copper drum to economise the full benefit of the heat, and for the purpose of warming the air and practically doing the work. The next thing was to make certain that the rooms were as nearly airtight as possible. The air could be introduced by two ways. The first was by side slits, screening and filtering the air according to locality and the nature of the atmosphere surrounding the building. These side slits or inlets would be about 5 or 6 feet above the level of the floor. Then there was to be fitted what he would call a main sewer or suction pipe below the floor, not too large, tapering off at one end next to and let in below at the edge of the stove fire. At the opposite end there should be an elongated grating tapering off into the suction pipe to carry off the carbonic acid gas. Then near the ceiling there must be several outlets distributed around the room, but not opposite to each other or directly opposite the inlets; these outlets to have branch pipes down behind the plaster under the floor to connect with the main suction pipe. By a natural law the expended air was forced upwards, and as the fire would draw from the easiest source of supply it would extract all its requirements from these outlets, and all the exhalations from the persons inhabiting the room were thus forced through the fire and so destroyed. The heavier or carbonic acid gases were likewise syphoned in and carried off by the same means into the outer air in a harmless condition, having passed through the fire. The other system was that instead of side inlets there should be one inlet, first of all screened and passed over quick-lime, which would absorb the moisture heated and further dried by the soil pipe in the copper drum of the stove, cooled down and passed over distilled water to again drink in moisture of undoubted quality, and so passed into the room. Mr. Rose further remarked that the same principle could be applied to a

sanatorium, and he contended that by its adoption it was quite possible to live, move and breathe as freely in a temperature of 120 degrees as in one of 60 degrees. He had tested this personally, and so could speak from personal experience. By adding extra moisture to the room they could have a Turkish bath of the purest kind. In such a room they could put a subject of gout, rheumatism, or even a tuberculous subject, and it was only a question of time, if they kept the subject supplied with distilled water, fruit and vegetable diet, how long he would be ere he wore off by perspiration the old body and got a new frame like unto that of a child, and so cure the former malady. Mr. Rose concluded by remarking that one great reform necessary to better the present condition of things was the thorough education of the architect.

Mr. Fyfe said the idea which Mr. Rose seemed to have running through his paper was that if they could cultivate in and around their dwellings the system which pervaded the universe from the equator to the other parts of the world, then they would have reached a perfect system of ventilation. It was quite true that in our present houses the feet were sometimes in an atmosphere of 40 degs., while the head was in 60 or 70 degs.; but the difficulty had always been to so ventilate the rooms as to provide for the absence of that state of affairs. He could not imagine how a stove could do the work, but if they could get some means by which the cold air could be cut off from coming from the outside underneath the door, then the problem might in some degree be solved. He must say the open grate was a very good means of ventilation, provided they could get better means whereby fresh air could be introduced into the room. As to Mr. Rose's system of curing disease, he was not sure that the par-boiled system would work. They had, however, got something to think about.

One or two other gentlemen spoke, and expressed doubts as to the stove doing all that was claimed for it.

Mr. Rose, in reply, said he had personally experienced all that he had said, and he was certain of its practicability.

BUILDER'S DISPUTE.

AT the Bodmin Assizes the case of Symons v. Angwin (S. J.) was heard.

Mr. Duke, K.C., said the action was to recover 140*l.* 10*s.* balance due under a building contract for the erection of a chapel, and 33*l.* 7*s.* 10*d.* extra to the contract. It was Silver-

well Wesleyan chapel, St. Agnes. The real question was whether the defendant and his co-trustees ought to pay that balance. The contract was made on June 18 last year to build the chapel for 310*l.* 10*s.* Some small additions were ordered during the progress of the work, in respect of which the plaintiff claimed 33*l.* 10*s.* The defendants had paid 170*l.* Some curious transactions occurred in the course of the matter. In March of last year the defendant and his co-trustees went to Mr. John Symons and told him they wanted to build a new chapel. They told him what they proposed to spend, and he drew a sketch. They were pleased with it, and asked him to prepare plans. He also drew out a rough draft of specifications, and some amendments were afterwards made. This action was tried there, and not before an expert, because the trustees alleged, and persisted in alleging, that Mr. Frank Symons made away with the true specification in this case, and had sought to put off upon the trustees a false specification. The plaintiff therefore sought not only to recover the money which was due to him, but he also wanted to clear his character of a serious imputation.

Mr. John Symons was unable to attend, owing to age and infirmity, and his depositions were read.

Mr. Frank Symons, the plaintiff, stated that in 1896 the business of John Symons & Sons, belonging to his father, was assigned to him. His father assisted him for his amusement and for exercise, but had no share in the business. His father prepared plans, but he could not write with a pen, owing to an infirmity of his right hand, and used a pencil. Witness used to ink some of the drawings prepared by his father. Witness took large contracts, and had put up the buildings in Cornwall given by Mr. Passmore Edwards. In the present case his father wrote the specifications in pencil in March of 1900 at his own house. His father told him (witness) what to put in the ink-written document produced. In May tenders were issued for the erection of the building. Plaintiff sent in a tender of 310*l.* 10*s.*, and on June 18 last year he signed the contract for the building. Stone was used in place of brick in the orchestra arch, because it was found to be better and stronger. Langdon, the clerk of the works, accused witness in the course of the works of having tampered with the specification. Witness called upon him to withdraw the insinuation, or he would not recognise him on the works. Langdon replied, "I didn't quite mean that, and if you take exception to it I will withdraw it." At a subsequent interview the witness complained to Langdon of the reports that were being circulated about his contract to

the effect that he was saving much on the slates used, and that the chapel would come down at one end in consequence of there being a stone arch instead of brick. Langdon said he should not take any notice of reports. Witness replied that the reports were damaging to his character and reputation. In some further conversation Langdon said witness could bring an action against him if he chose, and that he was quite prepared to defend himself. Witness made application for a further payment on account of the work, but he did not get it. Subsequently, when he handed over the complete building, the defendant said they had now a very good chapel. He was sorry there had been any dispute, and he wanted it settled up. Other trustees complimented him upon the way he had completed the building.

Mr. Foote did not contest the point that the work was good.

Mr. Duke said the issue had been narrowed down as to this charge, as the parties had agreed as to the amount owing on account of the contract.

Mr. Frank Symons, the plaintiff, in cross-examination by Mr. Foote, said there had been a good deal of country gossip as to his tampering with the specifications. He tendered for 40*l.* or 50*l.* less than the other contractors, and got the tender. Every alteration he made was before the contract was signed.

Mr. Foote said he agreed. But he suggested that the alterations were made after the tendering and before the specifications were signed.

Plaintiff said he charged 1*l.* 12*s.* 6*d.*, as an extra for French slate, although it was provided for in the specifications, and he did so because of the reports which had been circulated that he was taking advantage of the use of the slate in his building contract.

His lordship said that was one way of calling attention to the matter.

Plaintiff, in re-examination, swore he never wrote anything into the specifications except in the presence of his father and at his father's suggestion. He made no alterations after his contract was accepted.

Charles Carveth, a foreman of works at the chapel, in the employ of the plaintiff, stated that Mr. Langdon said the specifications had been tampered with. Witness said he had not altered them. The plaintiff called upon the clerk of the works to withdraw the charge, which he did.

Samuel R. Tonkin, carpenter, in the employ of the plaintiff, gave evidence of the interview between plaintiff and the clerk of the works.

Telegrams, "ACETUSE, LONDON."

J. H. Harris, another workman, swore that the plaintiff wrote in the words spoken to in the presence of the clerk of works and in consequence of what the clerk said.

Thomas Truran, senior, jobbing mason, said he was at the chapel when it was handed over. The defendant and two other trustees were present, and they expressed themselves very pleased.

Walter Durant, plumber, Redruth, deposed that on April 20 he inspected the specifications at the workshop of the plaintiff to take size of leads, &c. He produced a note-book of entries which he made at the time. They were made at the workshop of the plaintiff out of a printed specification.

Arthur Goynes, farmer and hon. secretary of chapel trustees, said he had nothing to say against Mr. John Symons, plaintiff's father. He believed him to be a man of high character. The trustees were always willing to settle the dispute, not wishing to drag it into publicity.

William Henry Moyle, builder and contractor, Chacewater, said in May last year, whilst he was at Mr. Goynes's house, his son copied the specification, which was subsequently compared with the original and found to be a correct copy. He had never seen the original draft pencil specification. — Cross-examined, witness denied that he had ever said he was not going to tender, or that he objected to Mr. John Symons as the architect.

Arthur Moyle, son of the last witness, proved making the copy of the specification.

Thomas Sampson, builder and contractor, Blackwater, deposed to examining this copy at Mr. Goynes's house and making notes and calculations from it.

Wm. George Samson, son of the last witness, gave similar evidence.

Charles Williams, Perranzabuloe, produced notes which he made from this copy of the specification, and to tendering for the work.

Matthew Henry Hodge, builder, St. Agnes, said after examining the specification he declined to tender when he found plaintiff's father was the architect, and that plaintiff was going to tender.

Oliver Caldwell, architect, Penzance, said he inspected the chapel on the 12th inst., and estimated the difference between the cost of the actual work carried out and that provided for in the specifications at 32%. That was omitting the slates. The cost of substituting Delabole for French slate would be 39%.

The difference in value between the two kinds of slate at present was 6*l.* 16*s.* — In cross-examination, witness said the erection of the chapel was a very good job, except in regard to a few details.

Mr. Foote, in summing up for defendants, submitted that plaintiff did not intend that anybody's tender should be accepted but his own. The alterations made all rendered the work cheaper to plaintiff to carry out than if the specification had been adhered to which the other contractors saw and some of them copied. This was substantially a charge of fraud, as they could not shut their eyes to the fact that the course which the case had taken had suggested that the specification was intentionally changed.

Mr. Duke, in reply to the defendant's case, said the question at issue involved the plaintiff's existence as a business man. He asked the jury to say that the plaintiff had not forfeited a lifelong character for integrity by descending to an unworthy and dishonest trick.

His lordship left it to the jury to say whether the ink specification was the one upon which the tenders were invited and framed, and which gravitated into the acceptance of plaintiff's tender. Undoubtedly, beyond all question the case involved the question of fraud. There was no blinking the matter that if defendant's case was right, plaintiff had been guilty of a gross fraud. It was a formidable case against him, and one which, if tried in another court, would certainly have been a very serious charge for him to answer. It was for the jury to say how far his counsel had suggested an answer. It had, he thought, been made out that the figures which appeared in the ink specification imposed, on the whole, less burden on the contractor than the figures and words found in Moyle's copy; so that if plaintiff were disposed and able to substitute and to get the people who had contracted with him to accept as genuine a specification altered in that respect, he would have less to do, and his contract would be performed more readily, and at less expense to himself, than if he had stuck by the document copied by Moyle. The differences between this document and the ink specification were very numerous. No one would think of entertaining a serious accusation if there were only one, two or three instances of this sort, but when they were multiplied until they ran into dozens, was it possible there was any explanation except that something else had been substituted for the specification since Moyle saw it? He had listened in vain in Mr. Duke's speech for any suggestion as to how the differences in

the two copies of the specifications could be accounted for. Mr. Duke said it was a conundrum he was not called upon to answer, but it was a conundrum the jury were called upon to answer, and they must say if there was any possibility of a mistake, or whether there had really been a substitution of some leaves and pieces of paper for others in the ink specification.

The jury came to the conclusion that great carelessness was exhibited in the transaction, and a verdict in keeping with the judge's charge was returned.

THE LONDON WORKS DEPARTMENT.

At the meeting of the London County Council on Tuesday, the finance committee submitted their half-yearly return of works completed by the Works Department. During the half-year ended March 31 last twenty-five estimated works have been completed and are now reported upon. These are the whole of the works completed during the half-year, but the total gives no indication of the turnover of the department during that period, because some of the expenditure on these works occurred previous to the half-year in question, while, on the other hand, a large part of the expenditure during the six months was upon works which are still unfinished. The approximate expenditure on estimated works for the half-year was 155,000*l.* On the total amount of the work comprised in the statement—namely, 83,924*l.*—there is a balance of cost under the final estimate of 391*l.*, or 0.5 per cent. Most of the works have been carried out at a cost somewhat less than the final estimates as certified by the chief engineer or architect. There are six cases in which the cost has exceeded the final estimate, but in only two of these is the excess considerable. These are both architectural works, and in the first case the excess of estimate is 9 per cent. and in the other 10 per cent. The jobbing works for the half-year show that on 1,214 works there is a balance of cost below schedule value of 857*l.*, or 6.9 per cent. At the present time the department has twenty-nine works in progress (exclusive of jobbing works), representing a total estimated cost of 733,350*l.*, in respect of which work to the cost of 546,507*l.* had up to May 31 been executed. There are also thirteen other works not begun, the estimates for which amount to 124,985*l.*

Mr. Bruce, chairman of the sub-committee of the finance committee, who have to deal under the revised scheme with the works department, said the report was a favourable one,

but there were some works in hand which might not show quite such favourable results. The exact results could not, however, yet be estimated. Much was said last week as to the reorganisation of the department. He did not think that the scheme of putting the work either directly under the architect or the engineer was feasible, as both those officers had their hands very full. The sub-committee consisted of men of great experience, some of them might be called experts, and watching the department week by week, they were probably able to form a better idea of the strong and weak points of the department than could any commission of outside experts such as had been proposed. There was little doubt, however, that what he might call the municipal idea, that the workmen would work better for the municipality than for a private contractor, had not altogether been a success. It was to him an important matter that they should see whether some form of co-operation could not be instituted which would give some direct interest to the men, and induce them to put their backs into their work.

Mr. Campbell thought it was not worth while for the Council to encumber itself with a system which led to scandals. Perhaps it would be better for them to go back to the works committee. The members of the sub-committee who dealt with works really knew nothing about them.

Mr. Howell Williams said they wanted the master's eye on the work done. If the department had gone about the work in the right way, it would have been a magnificent success. Instead of the finance committee dealing with such a gigantic institution as the Works Department, he thought it better that the works committee should be reinstituted.

The report was then received and adopted, and votes were agreed to to cover the cases in which there has been an excess over the estimates.

PORTOBELLO NEW BATHS.

PORTOBELLO certainly deserves a meed of commendation for her go-ahead spirit and business enterprise, and perhaps nothing illustrates these qualities better than the new baths which have just been opened. They are built of Dumfriesshire red stone, and are amongst the best equipped and most commodious baths in the United Kingdom. There are swimming-baths, and to them are added Turkish, spray and douche baths. Facing the sea, on the first floor are retiring and reading-rooms. The front of the baths skirts the promenade, and admission is gained there. The entrance is in duplicate,

ladies entering by the right and gentlemen by the left. Beyond these doorways there is a capacious vestibule, which is divided into two parts by massive columns and entablature of Doric order. To the left and right of the entrances are the passages to the plunge baths. In the portion allotted to gentlemen there are six first-class baths, with twelve dressing-boxes, while in the parts used by ladies there are four baths, with eight dressing-boxes. A prominent feature of the baths is the arrangement whereby a ready supply of salt water can be had. This, it is believed, will prove one of the strongest attractions of the baths, offering, as it does, all the benefits which physicians say are derived by immersion in salt water, while the risks of ordinary sea-bathing are entirely absent. The first-class bather in the new building will have full control of the feed-pipes, as well as being in electrical communication with the attendants. The hall in which the large pond is laid out measures 95 feet by 55 feet. The swimming-pond is 75 feet by 35 feet, the depth of the water being 7 feet at one end and 3 feet 6 inches at the other. Along the sides of the hall are fixed 56 dressing-boxes. Cast-iron columns, with moulded capitals, divide the hall longitudinally. By these columns are supported the gallery and the roof. The three sides of the pond are surrounded by the gallery, which is staged and seated for onlookers. The gallery is a very noticeable feature of the hall, and is fronted by a massive ornamental balustrade of polished teak wood, with embellished sunk panels at intervals. The south end of the hall is portioned out as a gymnasium, which in turn provides all the athletic requisites commonly used at galas and different aquatic exhibitions. The gymnasium covers in space 32 feet by 30 feet. At the north end of the baths is an alcove 33 feet by 14 feet in depth. At the private entrance to the baths from Melville Street and adjoining the gymnasium, is a resuscitation room, in which will always be ready the necessary medical appliances, and which is also fitted up with heated baths. There is a similarity between the baths for women and those for men. Situated between the respective ponds are the second-class baths. They differ from the first-class baths in being under the control of the attendant and not of the bather. Adjacent to these baths is a sitz bath, and near it are the offices for the superintendent and female attendants. The Turkish bath occupies the centre of the southern portion of the building. It consists of two hot rooms, the laconicum and calidarium, where the temperature will range from 200 to 210 degs.; a sudatorium at a temperature

of about 190 degs., and the tepidarium or cooling-room. The shampooing-room, which is fitted up with the usual spray, douche and other apparatus adjoins the sudatorium, but is entered by a disconnecting porch. There is a Russian vapour bath in the same vicinity, while here there is also a cold plunge bath 16 feet long by 5 feet wide. The fittings of the tepidarium are of a most complete kind. There is a series of lounges which, for privacy, are suitably curtained off. On the first floor of the building there is a series of rooms for the use of visitors. The centre room has been fitted up as a refreshment buffet, and is connected with the kitchen in the flat above by means of lifts. Adjoining the refreshment-room there is also a smoking-room. Over the ladies' entrance there is the coat-of-arms of Portobello, and above the gentlemen's entrance the coat-of-arms of Edinburgh is shown.

The Corporation had the benefit of expert advice in connection with the purity of the sea water, and as a result have adopted a system whereby the water is pumped from a point 400 yards distant from the promenade. Dr. Stevenson Macadam, who prepared an extensive report on the purity and saline qualities of the water for the Corporation, selected this point. In his report Dr. Macadam said the water was practically free from contamination or from organic or other impurities. The boiler, which is one of the principal portions of the plant at the baths, is a 22 feet by 7 feet Sinclair's Patent No. 1, and generates steam for the whole building. This steam is used for heating the water of both ponds, driving the pump, heating the building, heating the salt and fresh water and the Russian and Turkish baths. The salt water is pumped up from beyond low-water mark by means of a Worthington steam piston pump, capable of delivering 15,000 gallons per hour, and the water is drawn from the sea by means of a 10-inch pipe. The water is then put through a Reeves filter, and from thence sent to the ponds and a tank for sea water, which holds 3,600 gallons, and supplies the plunge and other baths. The plunge baths, which are sixteen in number, have both a salt and a fresh water supply. A patent fitting is here introduced necessitating the bather turning on the cold water first, thereby doing away with a possibility of scalding. All the water-supply piping is so arranged that any portion of it may, in the event of a breakdown, be shut off, and the rest still be kept in use. The heating of the water is performed by means of steam calorifiers. The drainage of the building was throughout executed under the supervision of the burgh engineer, and is of iron piping.

ESTABLISHED 1855

Great difficulty was experienced with this work owing to the sea water coming beyond the level of the sewers. The filtered water is either conveyed direct to the swimming ponds or forced to the storage tanks by means of check valves. These tanks are situated above the engine and boiler house. The filter-bed can be thoroughly cleansed by a reversal of the flow of the water. By this means the accumulated impurities are carried to a specially-constructed draining basin. The whole of the filtering-beds can be thoroughly sterilised by steam injection at boiler pressure by means of a simple mechanical process. In this way all animal or vegetable germs that may have remained in the filtering-bed are completely destroyed. The pumping and filtering machinery has been erected by Mr. J. Reid Ellis, Portobello, local agent of the sole licensees, Messrs. Mather & Platt, of Salford. Mr. Morham, the city architect, prepared the plans. The cost has been over 30,000*l*.

GLASGOW WATER SUPPLY.

THE Corporation of Glasgow, during their annual inspection of Loch Katrine Waterworks, opened a new supply tunnel which practically doubles the flow of water to the city. In 1855 the Lord Provost, magistrates and Council of Glasgow obtained power as Water Commissioners to acquire the works of the Glasgow Water Company and the Gorbals Gravitation Water Company, and to construct new works for bringing a plentiful supply of pure water to the city and surrounding districts from Loch Katrine, in the Perthshire Highlands, a distance of 34½ miles. There were now two lines of aqueduct for conveying the water from Loch Katrine to Glasgow. One was constructed under the Act of 1855, and was designed and carried out by the late Mr. J. F. La Trobe Bateman, M.Inst.C.E.; the other was constructed under an Act of 1885, and was designed and carried out by Mr. James M. Gale, M.Inst.C.E., the engineer to the Corporation Water Department. By the Act of 1855 power was taken (1) to raise Loch Katrine 4 feet above its previous summer level, and to draw it down 3 feet below its previous summer level, making 7 feet in depth to which the loch could be drawn upon; (2) to take 50,000,000 gallons of water per day for the supply of the city and suburbs; (3) to construct a line of aqueduct and a service reservoir; and (4) to utilise the waters of Lochs Vennachar and Drunkie as compensation water to the river Teith. By the

Act of 1885 power was taken (1) to raise Loch Katrine other 5 feet, making 12 feet in all that might be drawn upon for the supply to the city; (2) to take a further 60,000,000 gallons per day for the supply of the city and suburbs; (3) to construct a duplicate line of aqueduct and service reservoir, with lines of pipes to the city; and (4) to raise Loch Arklet 25 feet above its present level, and lead the water from this loch into Loch Katrine by a tunnel. The first aqueduct from Loch Katrine to the service reservoir at Milngavie was 25¾ miles in length. It was 8 feet wide by 8 feet high, with arched roof, and was capable of discharging 40,000,000 gallons per day. The second aqueduct, which ran almost parallel with the first all the way from the loch to the service reservoirs, was 23½ miles in length. It was 12 feet wide by 9 feet high, with arched roof, where not lined with concrete, and 10 feet wide by 9 feet high, with arched roof where lined with concrete, and was capable of discharging 70,000,000 gallons per day. The two aqueducts, taken together, were capable of discharging 110,000,000 gallons per day into the two service reservoirs, which were distant about 7 miles from the city. This quantity of water would fill a canal 30 feet wide and 6 feet deep for 19 miles. The construction of the new aqueduct had taken from March 1886 to June 1901 to complete, or 15 years. The Mugdock reservoir had a water surface of 62 acres, and a capacity of 500,000,000 gallons. The Craigmaddie reservoir had a water surface of 88 acres, and a capacity of 700,000,000 gallons. Combined, these reservoirs contained 24 days' supply at the rate of 50,000,000 gallons per day. There were four lines of 36-inch pipes from Mugdock Reservoir and two lines of 36-inch pipes from Craigmaddie Reservoir. The water from Loch Katrine underwent no filtration, being merely strained through fine wire gauze netting to prevent sticks, leaves, &c., from passing into the pipes. In order that the water might be kept free from pollution, the feuing rights over the whole drainage area of Loch Katrine and Loch Arklet, extending to 26,295 acres, were, in 1892, purchased by the Corporation at a cost of 17,000*l*, and the owners of the lands within that area were prohibited from erecting any houses or buildings on any part of those lands. The cost of the new aqueduct was as follows:—Reservoir, 316,600*l*; aqueduct, 730,640*l*; outlet works and raising loch, 40,731*l*; lands and compensation, 93,721*l*; engineering, 31,588*l*.—in all, 1,213,280*l*. The new mains from Craigmaddie cost 116,126*l*. The old aqueduct and mains cost 1,515,570*l*; less extensions in the city, 246,907*l*. Subject to this deduction, the cost was 1,268,663*l*.

ARMoured FIREPROOF DOORS

To the requirements of the Fire Offices Committee.

# The Architect.

## THE WEEK.

ALTHOUGH the plans for the memorial of the late QUEEN submitted by the five selected architects have been under consideration for a week, there is as yet no intimation that any one of them has secured favour with the committee. Apparently other suggestions have also received attention. The success of the Federation triumphal arches in Australia has not been overlooked by the representatives of various colonies. If a handsome arch can be made of materials which are not intended to endure, it is believed to be no less easy to realise one in marble or granite or in some of the varieties of colonial stone. A series of arches representing various colonies must be a subject for debate. Any project of that kind is likely to affect the proposals of the five designers. From the present aspect of the case it looks as if the recent competition was only provisional, and that a larger, and it may be a more earnest one, will have to be attempted.

ACADEMICISM in architecture is still dominant as a principle at the French Académie des Beaux-Arts. The production of anything which would suggest that the five orders and the rules for mechanical proportion are in the least degree obsolete is supposed to be an unpardonable offence. That, at least, has been the fate of M. TONY GARNIER. He competed for the Prix de Rome, and sent in drawings of a *tabularium*, according to the rules and regulations in that case made and provided, as the lawyers say. At the same time he believed that the twentieth century was not the time to play with antiquarianism, and accordingly he submitted a scheme for a *cité industrielle* which would be modern in every inch. Like the majority of his countrymen M. TONY GARNIER is a logician, and he wrote upon his designs, "All architectures are founded on a false principle. The architecture of antiquity is an error. Truth alone is beautiful." Young men in revolt in Paris require formulæ of that kind in order to convince themselves they are acting like heroes. The Institut is always gratified by insurrectionary principles, for they afford an opportunity to the ancient judges to uphold the cause of law and order. M. TONY GARNIER'S meritorious designs for the *tabularium* were accordingly disregarded as if their existence were unknown. With one class of clients the action of the Academicians might do the young architect a serious injury; but the ordinary Frenchman is, we imagine, too shrewd to allow anything said or done by the Institut to cause him inconvenience. M. TONY GARNIER'S effort to express his own ideas might easily be disregarded, but his design for a *tabularium* should not be rejected, because his *cité industrielle* would meet modern requirements.

THE report on bookbinding by the Society of Arts deserves careful attention from those who own books, as well as from librarians. For such an inquiry as one into the causes of the deterioration of leather when used in binding the Society of Arts has peculiar facilities. It is the one Society which can claim to have the diffusion of knowledge among the people as its *raison d'être*, and on that account any request for assistance is cheerfully responded to by experts. For the inquiry which has been lately concluded, bookbinders, tanners, technical professors, librarians, chemists, bibliophiles co-operated. The humblest possessor of books must have an interest in the conclusions, for there is no resisting the fact that in the majority of houses costly bindings quickly decay. There is now nothing like leather for destroying books, and this becomes the more remarkable when we find that the old cloth bindings which were introduced by CHARLES KNIGHT sixty years ago still resist gas and damp, and allow of constant reference without any injury to the books they cover. The committee found that since 1860 nearly all leathers seemed to get worse, and they ascribe the condition of calf-binding as much to excessive thinness as to the poor quality of the material. Binders and leather manufacturers maintain that the decay is in a large measure caused by the condition of the rooms in which the books are placed. The committee satisfied themselves "that in

libraries in which there was no artificial light used, and where the ventilation was good; the bindings were generally in a better state than elsewhere." If the books are placed in rooms which are much used they are generally in a bad state, but whether it is due to gas or other fumes is not decided. Daylight, and especially direct sunlight, disintegrates leather. Bookcases with closely fitting doors are preservative for books if no moisture finds its way in. It is recommended that library windows ought to be glazed with a slight yellow or olive tint, so as to exclude as much as possible the more chemically active rays. Dust is also injurious, but the usual method for removing it, adopted by servants in spring cleanings, is not judged satisfactory. Extremes of heat or cold, moisture or dryness should be avoided. It is also recommended that books should not be either too tightly or too loosely kept on the shelves. When the latter are only partially filled the books can be kept upright by the use of a flat angle piece of galvanised iron. When backs and joints open, repairing should not be neglected.

At the meeting of the Association of Waterworks Engineers the need was suggested by Mr. WILLIAM WATTS of a metallic service pipe which, while equal to lead in ductility and strength, would have in addition the power of resisting the solvent action of water charged with peaty and other acids. New piping is more readily acted upon than old, and probably a baser metal than lead—if one can be discovered—is all that is required. In recent years iron piping has come into more general use, and there is no reason why it should not be even more extensively used, as there is no doubt but lead pipes and cisterns are dangerous to health when used in the storage or conveyance of soft water. The time has also arrived when spun yarn should cease to be used in making the joints of socket pipes, and cold lead rings substituted. The fibre of the yarn is vegetable material, and in the course of time decays and pollutes the water. Some engineers have dispensed with it; there is no reason why others should not do likewise. The cost of solid lead joints is a little more than a yarn and lead joint, and the surface of lead brought in contact with the water can be reduced to a minimum. Mr. WATTS considers that these cold lead rings could be forced in by hydraulic power, and thus save the expense of firing, making joint holes, and setting-up, as in the case of molten lead joints; the sockets could be shortened, and the amount of lead required reduced. The standardising of pipe sockets is also greatly needed, for it would simplify and probably cheapen the manufacture of pipes generally.

THE subject of registration was dealt with at the annual convention of the Institute of American Engineers which was recently held at Niagara. The following questions were arranged for discussion:—"Do the interests of the profession and the duty of its members to the public require that only those who are competent be allowed to practise as civil engineers? Under what authority, through what agency, and upon what evidence of competency should applicants be admitted to the practice of civil engineering?" The majority of the speakers appeared to be adverse to the propositions, and finally it was decided to obtain a report from a special committee, which it was expected would be ready for the next convention in 1902.

IT is remarkable how persistent are the endeavours to keep the Berlin Museum on an equality with the foremost of its rivals. When the antique villa at Bosco Reale was discovered, Baron ROTHSCHILD was able to obtain the magnificent silver vessels which were found in the rooms, and he presented them to the Louvre. Although there was no second service of plate of the same importance, many other objects were met with which are no less interesting to architects and archaeologists. These have been secured for the Berlin Museum. They consist of a variety of vessels remarkable for their design and the extraordinary beauty of their forms. There are also candelabra, lamps and other objects in which silver was largely used. Bronzes have been also acquired which have assumed a patina which is comparable with what is seen in Pompeian works. The objects obtained from Priene several years ago have been placed in the same room: it is therefore possible to compare early Greek with Græco-Roman treatment.

## CHRIST CHURCH, DUBLIN, IN 1564-65.

REGRET has often been expressed about the scarcity of references to builders' work in old records. In some cases we can understand how laymen who found a difficulty in writing would not care to undergo the expense of having a narrative prepared of the operations in mansions or in business premises. But it seems incredible that clerics of all degrees should appear indifferent to the varied and often costly works which were executed in the buildings under their charge. As a result, we are in the dark about the history of Mediæval architecture as well as of later transactions connected with building. Controversies have arisen which could have been obviated by a few entries in one of the archives which were kept in ecclesiastical establishments, but which mainly relate to the daily life of the clergy and their immediate dependents. An example of what could be done without involving extraordinary trouble is furnished by the diary of PETER LEWYS, who was precentor of Christ Church Cathedral, Dublin, and acted as proctor in 1564-65. An account of this precious document, which rivals in interest the memorial of one of the COSMATI discovered by Sir THOMAS DREW in the crypt of the building, is given by Mr. JAMES MILLS in the last number of the "Journal of the Royal Society of Antiquaries of Ireland."

In 1535 the Reformed Church had been established by law in Ireland, but then, as now, only a small minority of the inhabitants accepted its doctrines. In 1562 ELIZABETH, who then reigned, had given aid to the French Huguenots, many of whom found their way to Dublin; but in 1564 a treaty was concluded by which there was at least an appearance of peace secured for some time in the relations of France and England. The troubles which arose in Ireland in the early years of Queen ELIZABETH's reign and the uncertainty about the ritual which Her Majesty intended to approve were not favourable to the preservation of the old churches. Christ Church had been allowed to fall into a state of ruin, which from time to time seems to be inevitable. As the building was attended by the Court officials there was a tacit responsibility for its preservation by the English Government. The Earl of SUSSEX, the Lord Lieutenant about 1562, made arrangements for undertaking works, but they were left incomplete. In 1564 the restoration was placed in charge of PETER LEWYS.

As the nave was roofless it was necessary to begin with covering that part of the building. In those days it was not so difficult to obtain timber as was the case afterwards, when woods were destroyed in order that they might not afford shelter for Irish outlaws. Two great cranes were set up and a "winglas," a word still heard among workmen in Ireland, was provided for raising the materials. The stones were carried up in a "gime" or basket. The knowledge of the mechanical assistance which can be obtained by the use of a pulley does not appear to have been known in Ireland in the sixteenth century. In its absence melted tallow was used in large quantities to grease the ropes and increase their pliability. The scaffolding was made up of spars 14 feet long on which hurdles were placed. The framing of the new roof was formed of timbers 22 feet in length by 10 inches square; they were joined together with spike-nails. When the carpenters had completed the framing the heliers or slaters laid down the laths which they had already prepared. The slates used were brought from Wales. As might have been anticipated more was required than covering the nave. The roof of the choir was found to be defective and the principal couple was ready to fall. A new couple was set up by the carpenters, who measured the space with a line of pack-thread. A ladder of nine rungs was made for the use of the slaters, and they were provided with 1,000 slate pins. As the work progressed further defects were revealed. The wooden gutters of the choir were rotten, and the water percolated into the wall. Part of the battlement of the lady chapel had given way and fallen into the gutter. It had to be broken up. In those days there was a rood-loft in the cathedral, but its exact position can no longer be ascertained; but there was a large arch above it, on which the stability of the steeple depended, and it became necessary to strengthen the masonry. Centering was prepared by the carpenters, while the masons dressed "white stone." The arching, although important, does not appear to have required more

than a fortnight to complete. Then we are told the timber, the hurdles and the empty cask used to hold mortar were placed for safety in the Mary chapel under lock. There is a reference to a screen "where the story of the Passion was painted" in connection with the rood-loft, but the paintings were destroyed during the operations.

There was an abundance of stone in the neighbourhood of Dublin, but neither the limestone nor the granite could be accurately described as "white stone." In another document of the sixteenth century it is mentioned that one of the Dublin aldermen presented "white Flanders stone to repair the pillars or jambs of the church." It may, therefore, be assumed that the stone was of foreign origin. LEWYS also mentions its use in his next work, which was the rebuilding of the arch in the north aisle. He says:—"I made a bargain with HARRIS, the mason, and his company to make and close the door, and make it with a good arch on the north side of the rood-loft in the aisle for the safeguard of the steeple, that the wall was cracked, 30s." "I began to cause the masons to lay the foundation of the new arch of the north aisle to stay the steeple. The wall was rent very sore, and I was in great doubt of it." He was also compelled to take down the upper part of the Trinity chapel through fear it would fall and break the roof of the cloister.

The most important work which devolved on LEWYS at the time was the construction of a new arch beneath one under the north side of the tower. It was to be supported by masonry built up in the old piers and which had to be carried down to the crypt. The work of the foundations was commenced on May 14, and on May 17 he gives the following record of the process employed:—

Six masons this day about the foundation of the steeple in the cellar under the church. I did build and pile with oak timber. I filled in the foundation with the rock lime, and then piled upon the same stakes of spires 10 feet long, set down in the ground with great violence and strength of foundation by great sledges, beaten by men. And upon that pieces of oak 10 inches square, laid upon that again, and set with rock lime upon the same, that the mortar to fill all the work, and to fill betwixt all the timber. And set across upon the same timber other great oak timber upon the same, and rock mortar upon the same again, and the great broad, black stones of Clontarf and of Dodder water, and so filled up my pillar. And betwixt two pillars I found two dead skulls of men's heads, cryched in a gutter with fair red clay, and a monument made of white stone about the bodies. I brought all the choristers to see the making of the foundation, and every of them brought a stone to the foundation, and I beat them all that they might bear in remembrance of the making of the work, and I bestowed upon the children at the same time 1 terstyn.

The unhappy choristers were to be pitied who were inveigled into the crypt, about which so many legends were current, each carrying a stone, and then had to endure a flogging. It is strange how ancient is the belief that the rod is an infallible cure for weak memories. Not many years have elapsed since the practice was abandoned in London of trouncing schoolboys over the parish boundaries. Mr. MILLS tells us that the underpinning through which the choristers so unjustly suffered is still to be seen in the crypt:—

In the exact position, which the notes in the journal indicate, are two rectangular piers supporting the crypt vaulting under the arch, which Lewys at this time was endeavouring to strengthen—that under the tower at the opening of the north transept.

Another interesting circumstance is recorded in the diary. The masons were obliged to quarry the stone they used. Instead of going to an ordinary quarry they removed the stones from the bed of the Dodder. This is a river which descends from the Dublin mountains, and sometimes in winter there are torrents which are as remarkable as the often painted "spates" of the Scottish Highlands. The removal of stones in the sixteenth century deepened the river, and was consequently a work of public benefit. The places selected were Milltown, Clonskeagh and Rathmines. According to Mr. MILLS, "In no case was the ground opened to find the stone. The rock was worked only at points where it was naturally exposed, no matter what difficulties its position entailed. A gang of about ten men were employed to struggle against the river, making and maintaining dams to keep it from the place where work was

being carried on, or 'laving' the water out with wooden bowls nailed to long wooden hafts, or carrying the stones secured to the carts." The operations appear to have been more than once suspended through inundations. As a result the Proctor sought a new supply of stone at Clontarf. There, however, he had the sea to contend with instead of a mountain torrent. The stone, he said, was also "so hard that it eats the steel very sore," or, in other words, a French smith was constantly engaged in keeping the tools in condition.

LEWYS may have been indifferent about surnames, but it is certain that the men employed by him are called by the name of their trades, such as Smith, Joiner, or Helier, instead of by a family name. The rate of wages was regulated by the civic authorities. In some cases LEWYS paid more than the standard rate, but the helier or slater and the glazier received less. Yet the reduced prices given to the two trades was still much higher than was paid to the masons and carpenters. Masons received 7d. to 8½d. a day, and the master-masons sometimes were paid 10½d. This suggests that in Christ Church, Dublin, the master-masons were not the architects, and elsewhere they may not have held that office, although the contrary is so often asserted. The masons obtained their meals from their employer. The men were not always satisfied, for it is put down that the masons "were wearied of salt beef, barrelled in winter for the summer." Beef was taken at all meals, and the customary beverage was home-brewed ale. The carpenters were paid 12 pence to 16 pence a day, but generally supplied their own food. The slater with his boy or attendant received together 21 pence a day, exclusive of food, and the glazier and boy earned 20 pence a day, "finding himself." The price for iron was 2s. 2½d. a stone; 5,000 slates cost 50s. 2½d.; lime was 12d. a load.

It would be well if other functionaries were as precise as Precentor LEWYS in his diary. To the higher clergy we suppose the entries were regarded as forming no more than a small-beer chronicle, but they have now become more interesting than many of the State Papers which expressed the ideas of the statesmen in the neighbouring Castle of Dublin. Mr. MILLS has rendered useful service by bringing the diary into light, and we trust much more will be found in it that will be interesting to architects.

### MURAL PAINTING.\*

ANY history of ancient art can now at the best be only provisional. We have more materials than were possessed by WINCKELMANN when he attempted to deal with the subject, or by LESSING when he endeavoured to lay down the boundaries between poetry, painting and sculpture. But from the abundance of our riches we have learned how much is unknown. There are objects lying concealed which will hereafter be brought to light by explorers and which will enable those who come after us to see new relations in ancient art. SCHLIEMANN'S researches have confuted many theoreticians who were dogmatic about early Greek art; and even of greater importance, in an historic sense, are the discoveries of Mr. ARTHUR EVANS in Knossos. Less than a century ago so great a thinker as COLERIDGE, who possessed the most exquisite taste in art, declared that everything remarkable in the arts of Egypt was derived from Greece. Many of his contemporaries agreed with him. What would be the value of a work on art which was inspired by such an idea? In fact, the speculations in a crowd of books about Egypt have been set aside by the efforts of a single explorer, Dr. FLINDERS PETRIE. The figures of animals which he found, and which probably belonged to a period 4,800 years before the Christian era, are proofs not only of independence of that stereotyped conventionality which was believed to have been decreed by the injunctions of priests, but reveal also a love of the grotesque which seemed to be hardly possible with men who were so subjected to rule. So much, in fact, is uncertain about the characteristics of the styles of different periods that Mr. WESTLAKE, the author of the latest

book on the subject, and who judges phenomena as a practical artist, does not hesitate to say that what has long been regarded as the most archaic work may be a product of a later time of execution:—

Some antiquaries observe that the rigid style is not so much the resort of art as the want of art. I differ. Art progressing amongst peoples would be somewhat like its growth in the individual in commencing to learn: very loose at first. Rigidity I take to be more the evidence of a decline than of a rising in art, and its being the usual concomitant of archaism often arises from the revived form of a decayed state—(1) Experimental art, loose; (2) a free practice arising from experience; (3) the age of the professor—rules, canons and rigidity. Hence in the decline of art in a certain epoch and its commencement in another, where it has discontinued—the rigid. For these reasons it has sometimes struck me that the hieratic, measured work of Egypt was an art declining from some previous greatness and civilisation.

Mr. WESTLAKE aims at no more than "a consequential essay on the elementary developments of mural painting; the first to the last from a painter's point of view." But he cannot take it for granted that the reader is acquainted with the traditional history of art in Greece, Egypt or in Etruria, and therefore he is compelled to go through that dismal historical region where there is so little light to guide the footsteps of a stranger. The works of art are alone worth utilising, although from their absence it is possible to draw conclusions which may appear convincing. Take, for example, the venerable and charming legend that painting began with an attempt to follow the outline of the face of a potter's daughter in Corinth from the shadow cast by a lamp upon the wall. SCHLIEMANN says that in all his excavations he never came across the fragment of a lamp, and that previous to the fifth century B.C. lamps were unknown. The old legend may have been illusory, but few would dare to have it set aside. If it must go, what chance is there of preserving other traditions? Mr. WESTLAKE is of opinion that from 508 B.C. we get historic names and authentic accounts of painting. It is true we have a long array of names, and there is no lack of descriptions; but how we are to be sure of their authenticity is another matter. The authors on whose authority the historians of art rely were seldom contemporaries of the painters or sculptors, and as the majority of the incidents which they record appear to have been all intended to excite wonder, we cannot believe they were in keeping with ordinary life in Greece. It is only by a study of Greek vases we can realise the love of form and the principles of composition which prevailed in Greece. But as the figures are shown in outline, we can only conclude that a great many of the wall-paintings were executed in a similar style and with equal if not greater success.

We cannot, however, imagine how men with the keen eyes of the Greeks appear to be so indifferent to colour. Living in a land which, although of little value in the eyes of a modern agriculturist, was made beautiful by colour, the exercises in monochrome could only be looked upon as representations which, through incapacity in the artists or a desire for economy, could not be completed. The Greeks were able to support their treatment by the aid of tradition which always counted for much. Moderns know more than the Greeks. There is enough to show that primitive man was as enamoured of colour as of form. He tattooed his own body, and through some instinct, which is now incomprehensible to us, came to the conclusion that red made the impression on other men of denoting earnestness and worth. The Greeks were no exceptions; at least they painted their sculpture red, and they used the colour to a very large extent in their paintings. The primary reason for the selection is unknown to us, and wanting it we cannot easily arrive at an understanding of their æsthetics.

There is not, says Mr. WESTLAKE, an authentic example of fine Greek painting remaining, unless it be allied to pottery. With the aid of imagination we may possibly obtain an idea of the treatment, with the help of the works which have survived from the journeymen painters of Pompeii. We may also learn something from the grotto paintings of Etruria. But the latter are inspired by doctrines which were outside the belief of the Greeks. Greek influence is, however, to be traced in many of the Etruscan works. But it is evident that the love of painting among

\* *An Elementary History of Design in Mural Painting, Principally during the Christian Era.* With an introduction on the art of the pre-Christian period. By N. H. J. Westlake, F.S.A. (London: John Parker & Co.)

LOVING CUP. PRESENTED TO SIR THOMAS DREW, P.R.I.A., &amp;c.

the Etrurians made it necessary to have recourse to a division of labour, which, although favourable for economy, is not always advantageous to art. Mr. WESTLAKE, as a producer of mural paintings, is able to realise the system employed in executing them by the ancient artists with more accuracy than an ordinary archæologist. What he says, therefore, of the famous work, *Achilles Sacrificing the Trojan Captives*, which was found in a tomb at Volsci in 1857, is of importance:—

This picture may be called Græco-Italic, and its method and style prepare us for the earlier Roman and South Italian works, to the majority of which I think it superior. These paintings have brought to my mind the idea that some well-known master, probably with assistants and pupils, had a reputation for these sepulchral pictures. There is a great diversity of merit both in the drawing and proportion of the different figures, and some indifferently proportioned figures, as the general captive, for example, have parts, such as the extended foot, so fairly well drawn as to suggest another hand. Again, in the various hands of the figures there is a suggestion of different draughtsmen. The nude figure of the bound captive in profile, I should suggest, was done by the master himself from a life study. This figure might be a portrait, both in face and figure, of an Italian model who was well known in London studios; the resemblance is so striking that I cannot refrain from this comment. The work somewhat resembles that in the Tomba Golini at Orvieto, which is possibly later work done under the same direction, perhaps as late as 300 B.C.

It might have been added also that the designer of the sacrifice to the shade of PATROCLUS, although most competent in representing action, was, like all the tomb-painters, unable to produce such excellent lines as we see in the "specchi mistici," or magic mirrors, which suggest a variety of art from which Etruscan sternness, gloom and terror were eliminated. It is only by them we learn how lovable Etruscan art became, and they hold the same relation to the mass of Etruscan paintings that the "putti" in the Sistine Chapel of the later Etrurian, MICHEL ANGELO, bear to the awful *Last Judgment*. It is unsafe to judge of a work from a portion of the introduction, but we trust that in the coming parts of his work Mr. WESTLAKE will give us observations which are inspired by his acquaintance with art. Anyone without practical knowledge can write a history of ancient art, but what is most desirable is criticism that is based on the characteristics of the works, and is not drawn from hearsay, no matter how old.

It is, however, different when an attempt is made to explain the symbolism of many ornamental forms. If a rigid test were employed it would be found that many elements of decoration now in use express condemnation of the purposes for which they are used. But as they are introduced only for ornament few care about their latent meaning. So long as the lines are beautiful and adapted for certain spaces the users are satisfied. A fortnight ago, for instance, a Parsi temple was dedicated at Brookwood. It seemed to many people an innovation in this country, but all ornamentists know that from the earliest ages the sun was a productive force, and symbols of admiration for solar power can be traced to a dateless time. It might be said that wherever there was a circular form there was a likelihood of its having some connection with the source of light and heat. Egypt, Assyria, Greece and Rome, as well as most regions of India, all have employed the orb as a motif. It has been so largely sought as a basis, or as a suggestion for ornament, Mr. WESTLAKE thinks the palmette is nothing but one of the numerous variations. "I consider," he says, "that there are mainly two palmettes, one of the rays of the sun turned upwards or downwards with a central orb or part of an orb indicated, to represent some sun deity, probably HORUS; the other, with the rays downward, probably OSIRIS, besides certain floral sun emblems, perhaps originally the papyrus or the lotus; but, as I have observed previously, the Egyptians rendered many flowers in the same conventional way."

That is a symbolist's interpretation, and there are very few things which cannot be made to express a secondary meaning in the same way. It is impossible to say whether the palmette ever had a mystical meaning. Its formation as a natural object would not recommend itself to an artist, and the leaves have interest enough as a combination of lines to gratify all who love vegetation. That the anthemion is

derived from palm leaves is possible; but we cannot imagine the Greeks as being particularly disposed to make architectural sculpture become a sermon in stone. It seems to us of late days there is too much striving after esoteric meanings for very simple forms, and the artist is thereby transformed into a preacher. Beauty has been the first consideration with designers in all ages, and the expression of it will always be a sufficient privilege without seeking for more abstruse qualities. Mr. WESTLAKE speaks of the universal use of the palmette in Italy and Greece, and he believes that some master-mind, some great designer, must have been its creator; but with such extensive imitation there cannot have been an equally extensive effort to make it declare a dogma. He admits that the volute cannot as yet be ascribed to any natural form for its origin. But in this case also we believe appearance was the primary thought of the designers, and so long as the eye was satisfied no more was required.

Another form that is supposed to recall the sun is the figure of the sphinx. "The early Egyptian sphinx," says Mr. WESTLAKE, "has no wings; after receiving wings there is no curl in them of a decided character until about the eighth century B.C. None of the wings of the winged creatures in Assyria are so treated." But is it not more likely that the curling of the wings is to be attributed to a more subtle notion of the requirements of art which arose out of the revolution of years? The wings are but an ornamental appendage of the sphinx. We cannot imagine any use being found for them. HEINRICH HEINE, in whom the old Eastern spirit was strong, was unable to introduce them in his poem. The face and body of the sphinx are described in imaginative style, but although the lips as well as the claws have their office, he could not find one word to say about the wings. In truth the sphinx is a mystery, and we may say with HEINE's nightingale, or if we will, the Spirit of Speculation:—

O schöne Sphinx! O löse mir  
Das Rätsel, das wunderbare!  
Ich hab' darüber nachgedacht  
Schon manche tausend Jahre.

Mr. WESTLAKE says that he has continually felt the necessity of a handy book of reference on mural painting, and he would have been saved much time spent in research if one had existed. The works and details which he found of use to himself have been the basis of his book, of which the first part has appeared. The illustrations have, therefore, a practical purpose, and however slight the sketch it will be found to be suggestive. The "History of Design in Mural Painting" promises to be a valuable aid to designers, and the combination of ancient and modern work will show how far they are in consonance, and the knowledge of this mutual relationship must exercise a beneficial influence.

#### THE DREW LOVING CUP.

THE loving cup, illustrated on page 20, has been presented by the architects of Ireland to Sir THOMAS DREW on the occasion of his knighthood, after service as their president for twelve years, and as an active spirit in maintaining the Irish Institute of Architects for more than thirty-five years. Associated with it, at his desire, are two previous presentations of plate. One is a fine master apostle spoon, with the hall mark of 1533, a very early presentation to the future architect in 1838, and which is attached to the cup by a chain. The second is a fine "Fitzgerald silver medal," presented by the Royal Institute of the Architects of Ireland in 1865, and which is embodied in the cup. The cup stands 23 inches high, and is a reproduction of the fine Saunders Cup possessed by the Grocers' Company. It was executed by Mr. WEST, the Master of the Goldsmiths' Company in Ireland, and in Dublin by Irish hands. It is a fine specimen of repoussé work in no way behind the original, which is of the date of circa 1675.

Mr. Arthur T. Bolton, A.R.I.B.A., has been appointed master of the Architectural Association Day School, which will be opened at 56 Great Marlborough Street, W., in October next.

## WICKHAM CHURCH AND THE UVEDALE MONUMENTS.\*

THE village of Wickham (from "wic," a creek, and "ham," a home) is associated with the names of many historic personages, foremost among whom is the great bishop who took his name from this place. Some writers have claimed for William of Wykeham nobility of birth, but the facts appear to be that he was born here in the year 1324, since he died in 1404 at the age of eighty; that he was the son of John and Sibill Aas, or Ace, a name probably of Frisian origin, as there were many settlers in the southern counties of that nationality. The father of Wykeham, according to some, bore the name of Long. If so, it is probably a nickname on account of his stature, Wykeham himself being described as a tall man ("excelsi corporis statura"). His mother appears to have been of gentle blood, her husband a yeoman of the middle class. The arms adopted by the bishop were intended probably to indicate the profession of an architect, by means of which he had risen, a chevron suggesting a carpenter's square, and the motto "Manners maketh Man," implying that he was not ashamed of his lowly birth.

Some half-timbered houses in "The Square," as the open space in the village is called, and some dwellings in Bridge Street bear marks of antiquity, but the parish church in which we are assembled is the chief point of interest connected with the early history of the village. The building has suffered much at the hands of the restorers, but still retains points of interest associated with the names of Wickham and others of importance who have worshipped or found a resting-place within its walls. The Norman arch, under which the future bishop and statesman must have passed, still remains the principal entrance to the church, and formerly occupied a similar position at the end of the original nave, which was shorter by the length of the tower, a modern addition. The old nave was terminated by the western buttresses, as may be seen outside. The north capital of the entrance arch is sculptured with a "sagittarius" pursuing a monster, a subject common in the early bestiaries. The south door of the chancel and the arch opening to the Uvedale chapel are of the fourteenth century. The original plan was probably cruciform, but the modern transepts are out of all proportion to the nave; that on the south side is of brick and the work of the seventeenth century. In 1862 the north transept was built, a tower added and the chancel and nave reroofed. In 1874 an organ chamber opening to the transept was constructed to the west of the Uvedale chapel, when one of the monuments was removed, and the memorials of the dead suffered serious mutilation.

The history of the Uvedales, and their connection with the county of Surrey, where they were settled at Titsey, near Redhill, for several generations, has been given by the late Mr. G. Leveson-Gower, who owned the property, in a lengthy paper to be found in the Surrey Archaeological Collections (vol. iii. 1885), and the present remarks will refer especially to those members of the family who for upwards of three centuries were connected with Wickham and the county of Hampshire. The name of Uvedale, in the earliest documents written d'Ovedale, subsequently underwent many and curious changes—Ouve-dale, Uvedale, Woodhall, and from the well-known Hants corruption "ood," we get Udall and Udle, forms still found in Southampton and elsewhere. This family was originally settled in the county of Norfolk, where John d'Ovedale, by marriage with the daughter and heiress of Roger Malherbe, acquired property at Tacolnstone. In the church of Great Snoring in that county is the effigy of Alicia Uvedale, her habit charged with ar. a cross moline gules, the coat of the Uvedales, who bore, according to an old roll of arms, "a cross like a mill pike redde, in a fiede of silver, for a crest ii oisteriche fethers in a cap of maintenance," with the motto "Tant que je puis," which we may translate "The best I can." For more than 200 years (1304-1540) the Uvedales' principal estate was at Titsey, and on the sale of that property to Sir John Gresham in 1540 they settled at Wickham, which they had acquired by the marriage of John de Uvedale, sheriff of Hants, 1388 and 1399, with Sibilla, the daughter and heiress of John de Scures, Lord of the Manor of Wickham, who held the office of sheriff of Hants temp. Ed. II. and Ed. III.

It has been stated by Milner and other writers that William of Wykeham's early patron was Nicholas Uvedale, Lord of the Manor of Wickham and Constable of Winchester Castle, but that this is an error is proved, since the Uvedales were not connected with Wickham until the marriage of John de Uvedale in 1381 with the heiress of the Scures, the ancient lords of the manor. Wykeham's earliest benefactor is supposed to have been Sir Ralph Sutton, probably of the family of Sutton Scotney, who endowed the neighbouring priory of Southwick. His next benefactor was Sir John de Scures, above referred to, and for these two Wykeham specially

ordered by his statutes seven daily masses to be said at Winchester and New College. Of the marriage of John de Uvedale and Sibilla de Scures there were born a son, John, sheriff of Hants, 1419, and a daughter, Alice, married (1396) to William Wykeham, great nephew of the Bishop.

The Uvedale pedigree extends to so many generations and branches that I must further confine myself to descendants in the direct line, especially those who have brought augmentations to the family arms, as we have them displayed on the monuments at Wickham. Sir John de Uvedale by his marriage with Isabel Etton, daughter and heiress of Gilbert de Etton, brought the arms of Etton and Titsey into the family escutcheon, and the grandson, John de Uvedale, having married the heiress of the Lord of Wickham, acquired the arms of Scures. Third in descent from him, Sir William Uvedale, by his marriage with Anne, daughter and co-heiress of William Sidney, brought the quartering of Sidney, and his son, marrying the daughter and co-heiress of Thomas Troyes, added that of Troyes. Sir William Uvedale, grandson of the preceding, by his marriage with Ellyn, daughter of Sir John Gresham, Lord Mayor of London, impaled the arms of Gresham. It is but the fragments of a grand monument of the last-named Sir William that we now see affixed to the south wall of the Uvedale chancel. At the top is a shield surmounted by a helmet and the Uvedale crest, a cap of maintenance with two ostrich feathers, and a coat of six quarters, viz.:—1. Uvedale, a cross moline. 2. Etton, barry of 8, or and az, on a canton, sab. a cross patente sal. 3. Titsey, gu., a fret sab. 4. Scures, az. fret or. 5. Sidney, ar., a pheon az. 6. Troyes, barry of 8, ar. and az.; three trefoils slipped counterchanged, on a chief or, 3 lions' heads erased or. Sir William Uvedale succeeded his father Arthur (1537-38), and was then under age. He died 1569, and by will directed his executors to provide "a seemlie and decent tombe and monument, the same to be built and set on the south side in the chapell nigh the chauncell of the parish church of Wickham, they to bestow for the charges and decent making thereof thirtie pounds."

The monument as we now see it consists only of a slate slab, covering the original panel, surrounded by an arabesque border. On the slab is painted the following inscription:—

Hic jacet Gul. Uvedale, armiger, qui obiit  
regni Reginæ Eliz. undecimo et anno Dom. 1569.

This is followed by two elegiac couplets:—

Vivit qui vivit jam corpore libera cælo,  
Mens fruitur, felix gaudet adesce Deo.  
Quis vetat emensum sinceræ tempora vitæ  
Ut capiat recti præmia posse mori?

## TRANSLATION.

He lives, who lives, his mind now freed from the body is now in the enjoyment of heaven, happy he rejoices in the presence of God. Who forbids him who has spent a good life to receive the reward of good conduct to be able to die.

Under the slab embedded in the wall are three shields, bearing (1) Uvedale quarterly of six as above described impaling Gresham arg. a chevron ermine, between three mullets, pierced, sable; (2) Uvedale, a cross moline; (3) Uvedale, quarterly of six again repeated.

This monument, as described in 1864 by Mr. Leveson-Gower, was in good repair, and might with a small outlay be properly restored. Instead whereof it no longer occupies its original position. The architect (Mr. Butterfield, I regret to say) in the enlargement of the chapel in 1872 removed the portion of the monument we now see to the west in order to insert in the south wall a window which is not wanted for purposes of light. The slab and its surroundings, as shown in a drawing by Mr. F. J. Baigent, originally surmounted a panelled altar tomb which supported an entablature, having on either side a female figure. These features of ancient art not squaring with the architect's ideas were ruthlessly removed. In refixing the inscription the lower part of the monument was destroyed, the figures were relegated to a garden in the parish, where, I am told, they still exist, but my informant would not tell their whereabouts. When men of professional reputation can perpetrate and local authorities allow such acts of vandalism, we may well exclaim "Quis custodiet ipsos custodes?" or who shall watch the watchmen?

The second monument in the Uvedale chapel is that of another Sir William, son of the preceding, and is in situ against the west walls. He was born in 1560, and baptized at Wickham, his godmother being Jane Countess of Southampton (an indication of the friendly relations between the Wriothesleys at Place House, Titchfield, and the family at Wickham). Sir William died at Wickham, and was buried January 9, 1615. This grand tomb in alabaster and coloured marbles, with an arched canopy, was erected to his memory and that of his wife. At the top is the crest and shield of arms of Uvedale, augmented to quarterly of eight by the addition of Gresham supporters also appear and the motto; on either side are obelisks and volutes terminating in lions' heads. Immediately

\* A paper read by the Rev. G. W. Minns at the visit of the Hampshire Archaeological Society to Wickham Church.

under the arch is an inscribed slab surmounted by a shield bearing the cross moline of Uvedale impaling Norton vert, a lion rampant or. On one side in a niche is a human figure representing Life, and on the other a skeleton, now in fragments, representing Death. The inscription is as follows:—

Memoriæ clarissimi equitis Gulielmi Uvedale, qui obiit octavo die Januarii 1615, ætatis suæ 56.

This is followed by six Latin lines:—

Vis, Lector, quis sit tumulo qui conditur isto?  
Flos Uvedallorum est gentis honosque suæ.  
Vis spacium vitæ? Sex quinquaginta Decembres.  
Pignora quæ fuerint. Ter tria. Quæve tori  
Consors? Nortoniæ stirpis Maria inclita, cujus  
Post cineres pietas vivet in hoc tumulo.

The inscription and the verses tell that the knight died on January 8, 1615, aged 56; that he was the "flower of the Uvedales"; that he had three times three children, and his consort named Mary, of the family of Norton, hopes to share his tomb. Next come some lines in English:—

Thy virtues (worthy knight) need not this tombe—  
Men's hearts and heaven afford them fairer room;  
Yet sith thy earthy part jointly deserved  
Thy spouse would it therein should be preserved,  
And wills that as one bed still held you twaine  
So might one grave at last your bones containe.

From which we may conclude that the monument was erected by the wife of Sir William, who was Mary, daughter of Sir Richard Norton, of East Tistead and Rotherfield. She died before 1634, but whether she be buried here we know not. Below the inscription is the effigy of the knight in armour, and at a lower level that of his lady; both hold a book of prayer. The lady is habited in the dress of the period of James I. At her head and feet are shields of the arms of the Nortons, to which due prominence is given by the builder of the tomb. The Norton shields are as follows:—Quarterly of 6 (1) Norton vert, a lion rampant, or. (2) Norton on a fesse between 6 cross-crosslets or 3 escallop shells gu. (3) Rotherfield az. a fesse nebulee between 3 crescents or. (4) Wayte arg. a chevron between 3 bugle horns sab. (5) Monpesson arg. a lion rampant sab. crowned or. (6) Norton as the first. On the plinth at the base are eight kneeling figures, habited in cloaks and ruffs; the hands in prayer are mostly broken off. On the right hand, holding a skull, is the first-born, a little son who died in infancy, and his death is thus recorded in the register, 1586:—"Mayster John Uvedale, then esquier, was baptized the xvth day of April at night, beinge sicke, and was buried the xviith day of April."

Of the sons who survived, William was the second son and heir. Richard was knighted in 1618, and settled at Droxford, where he died, and was buried in 1664. Francis made his home at Bishop's Waltham, where the registers contain numerous entries relating to his family. His will was proved in 1661. Of the five daughters Catharine, Honor and Mary married gentlemen of the county, and settled in Hants. Jane, the fourth daughter, died unmarried, and Lucy, the youngest, was married 1612 to Sir Thomas Bilson, doubtless of the family of Thomas Bilson, headmaster of Winchester College, consecrated Bishop of Worcester, 1596, and translated to Winchester in the following year. The tomb was in 1864 protected by a wrought-iron railing, on which hung a helmet, a pair of spurs, gauntlets and a pair of greaves of iron. Of these the helmet and spurs remain, also a portion of a wrought-iron stanchion, which was rescued from the shop of the village blacksmith, where the remainder was disposed of as scrap iron. Sir William Uvedale, born 1586, the second son and heir of the knight whose effigy, with that of his wife, recline on the tomb above described, was treasurer of the Privy Chamber temp. James I. and Charles I. He died in 1652, and desired to be buried in the chapel at Wickham. His attachment to the royal cause impaired his fortune, and compelled the sale of a portion of his estates. He married (first) Anne, daughter of Sir Edmund Carey, by whom he had issue one son, who died young, and three daughters. To one of the daughters, Elizabeth Vernon, wife of Henry, third Earl of Southampton, of Place House, Titchfield, was a god-mother in 1642. By his second wife, Victoria, daughter of Henry Carey, first Viscount Falkland, he had two daughters, Victoria and Elizabeth, who conjointly succeeded to the Wickham manor and estate. The former married Sir Richard Corbet, Bart., co. Salop, and the latter, first Sir Wm. Berkeley, Governor of Portsmouth, killed in action with the Dutch in 1666; and, second, Edward Lord Morpeth, afterwards second Earl of Carlisle. The Earl of Carlisle died in 1692, and lies buried on the north side of the chancel within the altar rails, where there is a slab to his memory. Elizabeth, his Countess, rests on the south side beneath a slab bearing the arms of Howard with those of Uvedale on an escutcheon of pretence impaling the cross moline of the Uvedales of Wickham, which

branch of the family, on Lady Carlisle's death in 1696, became extinct. No name is recorded, her monogram only and the date of death. Her arms, as in the case of a widow, are in a lozenge. Among the débris of the Uvedale chapel are the fragments of two coronets of tin, which probably hung over the Carlisle hatchments which, with many other heraldic insignia, were formerly affixed to the walls of the church, but

The boast of heraldry, the pomp of power,  
And all that beauty, all that wealth ere gave

have passed away, and all that survives of the Uvedales in the popular mind is a bequest to the poor of Wickham, which is known by the name of Lady Carlisle's Charity. On her death the family estates were divided between Sir Uvedale Corbet and Charles, third Earl of Carlisle, the grandfather of Lady Betty Delme.

The manor and advowson of Wickham became the property of the Rashleigh family; from them the manor was purchased by the Garniers in 1764. The old home of the Uvedales was pulled down in 1780 (like that at Titchfield called "Place House"). It stood in the field adjoining the school-house nearly opposite the church. Traces of the foundations may be observed, and by the boundary wall the jurors of the Court Leet and Court Baron are still accustomed to assemble to be sworn. A single stone bearing the arms of Uvedale is all that can be identified of the mansion. When the house was demolished in 1780 this stone was presented by Jonathan Rashleigh, to Winchester College, and was fixed in the north wall of the chapel as a memorial of the traditional, but unfounded early relation between William of Wykeham and the Uvedales. Underneath was written, "Uvedallus Patronus Wiccami." Mr. T. F. Kirby, the bursar of the College, informs me that this stone is now preserved at Titsey, as we have seen, a former seat of the Uvedales, and a facsimile provided by the late Mr. G. Leveson-Gower has been substituted for the original in the chapel wall.

Some other objects in the church at Wickham are worthy of notice. On the south side of the sanctuary are two sepulchral cross slabs of the thirteenth century—one of unusually small size, probably that of a child, measures 2 feet 8 inches only. There is also a pretty eighteenth-century monument built into the angle of the south transept to commemorate some of the name of Swann, who bore az. a chevron between three swans ar. The family, I am told, followed the medical profession, and occupied the house by the railway opposite the church. Other memorials within the church record the names of Dumaresq, 1796, of the Island of Jersey (Insula Cæsarea), with arms on a shield ar., three trefoils vert; Wynne, 1732; Ball, 1739; Callaway, 1789; and on the north wall of the tower is a good seventeenth-century monument to the memory of William Faulkner, mariner, 1689. An old banded chest of iron, of the type commonly said to have been recovered from the Armada, is preserved in the Uvedale chapel, now used as a vestry. Two brackets on either side the chancel carved from oak of the old roof by workmen during the restoration bear the names of William of Wykeham, John de Uvedale, John de Scures, 1381, and Sibie (*sic*). A moulded top of a tomb forms the dais of the altar. In these notes I have confined myself to the parish church and its associations. I have derived much information from Berry's "Hants Pedigrees," the paper by Mr. G. Leveson-Gower, the Rev. G. H. Moberly's "Life of Wykeham," and some notes of my late friend and a former president, Mr. B. W. Greenfield, who visited the church in 1893.

#### THE KING ALFRED MEMORIAL.

THE Lord Mayor and the Mayor of Winchester have addressed the following letter to the City Guilds:—"You are doubtless aware that the national commemoration of King Alfred the Great will take place in the third week of September next. In accordance with the resolution of the Mansion House committee, of which we are chairman and hon. secretary respectively, a colossal statue of the great king has been executed by Mr. Hamo Thornycroft, R.A., and promises to be the finest piece of sculpture that has come from his hands. Publications on the king have been issued with a view to diffusing knowledge of his life and work. An ironclad has also been named after this ideal national hero, who is rightly regarded as the originator of the English Navy. You will recollect that it was King Alfred who refounded London after its destruction and spoliation by the Danes, repaired the walls and revived its commerce and became the founder of that prosperity which has ever since his day been a prominent feature of this the greatest city in the world. Subscriptions have already been given by the Clothworkers' Company of 100*l.* and by the Grocers' Company of 50*l.*, and we therefore venture on the part of the National Committee to invite your company's generous support to the commemoration. As funds are now needed we ask the favour of an early reply."

## NOTES AND COMMENTS.

For the first time Apsley House has been utilised for a garden party. The great Duke of WELLINGTON was generally a recluse, and the interior of the mansion and grounds were consequently among the least known in the Metropolis. His son imitated his illustrious father, and it was often difficult to say whether the Piccadilly mansion was occupied. Several changes in the arrangements were lately made. But the historic rooms, especially the Waterloo Chamber, are little altered. Apsley House contains valuable paintings. One fine example by VELASQUEZ was lent to the Guildhall Exhibition. Although of less financial, and it may be artistic, value, the paintings by SALTER and J. P. KNIGHT of the Waterloo heroes have most historic interest. The latter was reproduced on a large scale in *The Architect*. The present war has, of course, renewed the interest in the work.

It is difficult to decide what artist can be looked upon as the NESTOR of the French school. Whenever a venerable gentleman is designated as holding that position, no time is lost before a rival claimant appears for the unenviable privilege of age. This time there are two, an architect and a painter who were both born in the year 1800. The architect is M. ADOLPHE JOSEPH THIAB, a native of Bordeaux, and who since 1846 has belonged to the Legion of Honour. The painter is M. LE SOURD-BEAUREGARD, who was a pupil of DAVID and of INGRES. When in 1815 NAPOLEON gave a grand fête which was destined to mark his overthrow, a drawing of it was made by the young artist. He is a Parisian, but his career does not appear to have been as distinguished as many other artists. The only distinction he has received from the Salon is a third-class medal which was awarded to him in 1842.

THE Directory of the Board of Education relating to science and art schools has been issued. To students an interesting item will be the announcement that twenty Royal Exhibitions in Art are to be competed for, ten open each year, besides twelve National Scholarships, six open each year, and forty-five free studentships, fifteen open each year, all tenable at the Royal College of Art. There are also sixty local scholarships, twenty open each year, tenable at schools of art under the Board. A Royal Exhibition entitles the holder to an allowance of 25s. a week for the session of about forty weeks each year for two years, and free admission to lectures and instruction during the course for the associateship in the Royal College of Art. A National Scholarship entitles the holder to a similar allowance, and instruction in (1) design and ornament, (2) architecture, (3) modelling, (4) drawing and painting. The competitor for the National Scholarship must be a registered art student engaged in a trade which depends upon decorative art. A local scholarship is tenable for three years, with an allowance of 20s. a year at any school of art under the Board which is open at least three days and five nights a week, and which will remit the fees for instruction of the holder.

A VERY short time has elapsed since we noticed the second edition of Mr. W. F. STANLEY's treatise on "Surveying and Levelling Instruments." (London: E. & F. N. SPON.) A third edition has now been issued, which has the advantage of the co-operation of Mr. H. T. TALLACK. The house of STANLEY in Great Turnstile has its own *clientèle*, who loyally believe in the superiority of the firm's instruments. The collection described in the volume is remarkable for variety and ingenuity, and it must now seem amazing how so many great undertakings could be laid out from the days of TELFORD to those of ROBERT STEPHENSON with the primitive instruments which alone were available. Mr. STANLEY's book, as a record of improvements, would alone merit perusal. The demand for it suggests the necessity for an engineer being equipped with instruments which will save time in the field and in the office, besides limiting the possibilities of inaccuracy.

It would be remarkable if Messrs. MATHER & PLATT, LTD., whose names are connected with so many improvements in machinery, were to allow electric motors to pass

without the aid of their inventive power. They have for the past few years given very great attention to the manufacture of a series of steel-clad motors ranging from 2 horse-power up to 50 horse-power. The motors are so designed that they can be run either as open-type machines or fitted with wire guards to eliminate the risk of anything falling into them. They have also designed special fine gauze covers which insure absolute safety in cases where inflammable gases are present. Should it, however, be necessary that the machines be air-tight, special sheet-iron covers are used. If the motors are required to be hermetically sealed the output will have to be reduced owing to the want of ventilation. The amount of this reduction varies from 10 per cent. to 30 per cent., according to the output of the motor and the speed at which it is running. The motors are wound for any desired voltage and speed, and the very large number already sold have given the customers of the firm the greatest satisfaction.

CATHEDRAL SERIES.—CHICHESTER: THE SCREEN AND CHOIR

THE NEW CHILDREN'S HOMES AT SIDCUP, KENT, FOR THE GREENWICH GUARDIANS.

WE publish a view of the new homes at Sidcup Kent, that are being erected from the designs of Mr. T. DINWIDDY, F.R.I.B.A., F.S.I., and his son, Mr. T. NORMAN DINWIDDY, for the Greenwich Guardians, in substitution of the accommodation now provided at the District Schools at Sutton, on the Local Government Board's order for their dissolution. The whole site embraces about 60 acres of well-timbered park land. Accommodation will be provided in homes for 50 each, with a pair of cottages, for 224 boys, and in cottages for 15 each for 300 girls and infants. Isolation wards, gymnasium, swimming-bath, laundry, probationary cottages, and detached houses for master and mistress, with an administration block—for which a large residence existing on the site is to be adapted—complete the scheme. The buildings will be lighted by electricity, and a well is to be sunk to the chalk for water-supply.

The architect estimated the probable cost at 108,500/., and the contract was obtained in competition by Mr. ROWBOTHAM, of Birmingham, at the sum of 107,777/.. The buildings are being faced with Tunbridge Wells red pressed bricks, the fronts of the cottages being partly treated with rough-cast. The roofs will be covered with tiles from the Ruabon district.

FERRING GRANGE, WORTHING.

THE arrangement of this large mansion will be apparent from the subjoined plan.

PORCH AT HALIFAX.

TOURELLE, HALIFAX.

## HEVER CASTLE.\*

IN searching the ancient records for any interesting facts concerning this historical residence, we find that the name is spelled in three different ways—Evere, Heure and Hever. To explain why this should be so is not easy. The School Board of the then days only taught hard hitting. The science of the pen, which was affirmed to be greater than that of the sword, was an "extra," only learned by the very few; and so when the great ancestor was jeeringly asked why he spelled his name in so many different ways, not knowing what reason to give, he replied, "My name is my own, and I can spell it however I please."

The De Hever family were of Norman extraction and got possession of the estates in the reign of Edward I. Until the reign of Edward III. there were many disputes as to the right of tenancy, more particularly between Ralph de Hever, grandson of the first holder, and Nicholas Abbot. These disputes were ultimately settled in favour of his son William, who, by permission of the king, embattled the manor house. William had two daughters, Ioane and Margaret. Ioane married Reginald Cobham, and had a son, who became Lord Cobham—(on our visit to Cobham Hall last year I gave a short history of this family)—and Margaret married Sir Oliver Brocas. Lord Cobham ultimately obtained the whole property, and his grandson, Sir Thomas Cobham, sold the estate to Sir Geoffrey Bulleyn, a descendant of the Knight of Blickling and Saul in Norfolk.

Sir Geoffrey was a wealthy mercer in London, and also Lord Mayor of that city. He married Anne, eldest daughter of Baron Hoo and Hastings by his second wife, a daughter of Sir Nicholas Wichingham. Sir Geoffrey's son William, who was Knight of the Bath at the coronation of Richard III, married Margaret, daughter and co-heiress of Thomas Boteler, Earl of Ormond, and by her, with other issue, had a son Thomas Bullen, afterwards created Earl of Wiltshire and Ormond. It was he who enlarged and completed the Hever mansion. He married Elizabeth, daughter of the Duke of Norfolk, and had three children, a son George, who was executed in his father's lifetime, and two daughters, Mary and the celebrated Anne, wife of Henry VIII.

Sir Thomas Bullen was successful in suppressing the revolution in Cornwall created by Perkin Warbeck, who assumed the title of Richard Plantagenet, and laid claim to the crown of England. Sir Thomas was one of the knights of the king's

sent to Maximilian—the famous Emperor of Germany—who had served as a general under Henry VIII. and defeated the French at the "Battle of the Spurs." Later on Sir Thomas became sole Governor of Norwich Castle, and was employed

body, and jointly with Sir Henry Wyat was constituted Governor of Norwich Castle. He was one of the ambassadors

by the king as ambassador on all important foreign matters, and he it was who arranged the famous interview of Henry VIII. and Francis I. In order to carry out his design of marrying Anne, the king loaded Sir Thomas Boleyn with honours. He created him Baron and Viscount Rochford, and afterwards successively Earl of Wiltshire, Earl of Ormond, Knight of the Garter, and Lord Privy Seal, and one of the means taken by Sir Thomas to express his sense of the royal favour was his decided hostility to Cardinal Wolsey. He was one of the peers who signed the articles of impeachment against the Cardinal.

Anne Boleyn was born at Hever in the year 1507, and when only seven years old was appointed maid of honour to Henry's sister, who was married to Louis XII. of France, and was allowed to remain with her when the other English attendants were unceremoniously sent out of the country. When Francis I. came to the throne Anne remained under the powerful protection of his wife Claude, and was thus brought up at the French court. When war was declared against France in 1522, it is affirmed that she was brought back to England by her father, who was then ambassador to that country, and shortly after she was appointed one of the maids of honour to Queen Catharine, and was thus brought under the notice of that most profligate monarch Henry VIII.

Cavendish informs us that Anne had not been long at court when a strong and mutual attachment sprang up between her and Lord Percy, son and heir of the Earl of Northumberland, who made her an offer of marriage and was accepted—at this time she was only sixteen years of age. The marriage, however, was not destined to take place, for the king had already turned his admiring eyes in the same direction, and jealous of the rivalry of a subject, he caused the lovers to be parted through the agency of Cardinal Wolsey, in whose household Percy had been educated, and that young nobleman, probably under compulsion, married in 1523 a daughter of the Earl of Shrewsbury. On being thus separated from her lover, Anne was removed to Hever, and hearing in a few weeks of the marriage of Percy—with feelings that can well be imagined—kept herself secluded. To Hever the king repaired on a visit, but Anne, suspecting the cause of his arrival, under the pretext of sickness kept to her chamber till after his departure. But this reserve did more to animate than daunt the royal lover; so for the purpose of restoring the reluctant lady to court and bringing her within the sphere of his solicitations, Henry created her father Baron and Viscount Rochford, and gave him the important post of treasurer of the Royal Household, and surrounded himself with her relatives and friends, among whom were her brother George and her uncle the Duke of Norfolk. Still, however, Henry's suit—which was dishonourable, even to one so depraved and lost to

\* A paper read by Mr. Henry Virgoe before the members of the Upper Norwood Athenæum, on June 29, at Chiddingstone.

honour as he was—did not succeed, and it is said that she answered the king's advances in these words:—"Your wife I cannot be, both in respect of my own unworthiness and also because you have a queen already, and your mistress I will not be."

Foiled in his attempt to gain her by dishonourable means the unscrupulous monarch began seriously to try and obtain a divorce from Queen Catharine, who had been his wife for seventeen years, in order to marry Anne Boleyn. The history of these proceedings is a part of the history of the kingdom and need not be here detailed. It is, however, a tradition of Hever that when the king came "a-wooing" he sounded his bugle in the distance that his lady-love might know of his approach.

The divorce was obtained, and Anne became "indeed a queen," having previously been married to the king. She gave birth to two children—a stillborn son and Elizabeth—who was afterwards queen. The king, it is affirmed, being greatly disappointed in not having a male heir to the throne, had Anne arrested on a false and disgraceful charge of immorality, and she was beheaded to make room for Jane Seymour, one of her own maids of honour.

After the death of the Earl of Wiltshire in 1538 (there being no male issue) Henry VIII. seized the castle of Hever in right of his murdered wife, and in 1541 handed over the whole estate to Anne of Cleves. She lived there till her death in 1557, when the Crown authorised the sale of the property to Sir Edward Waldegrave, Lord Chamberlain to the household of Queen Mary. On the accession of Elizabeth he was committed to the Tower, where he died in 1561, and the estates afterwards passed through the family of Humphreys to that of Medley, or Manners, and in 1745 Hever Castle was purchased by Timothy Waldo, of London, and of Clapham, in Surrey.

The family of Waldo is said to derive itself from Thomas Waldo, of Lyons, who was one of the first to renounce, publicly, the doctrines of the Church of Rome. In the reign of Elizabeth he came over and settled in England to escape the persecutions of the Duke of Alva.

In 1575 Peter Waldo resided at Mitcham. His eldest son, Lawrence, had fifteen children; of these, the twelfth child, Daniel, is the one pertaining to our present inquiry. He was a citizen and clothworker of London, and was fined as alderman and sheriff in 1661. He married Anne Claxton, by whom he had nine children. Of these, the eldest son, Daniel, whose property was burnt down in the Great Fire of London, in 1666, married twice; and from him are descended the Waldos of Harrow. After the Great Fire, Edward, the second son, purchased the sites of the Black Bull, the Cardinal's Hat and the Black Boy, in Cheapside, on which he erected a "great messuage" in which he dwelt. When this mansion was taken down in 1861 some very fine oak carving was found, which is now at Gungrog. This Edward Waldo was knighted by King Charles II. at the house in Cheapside in 1677. On this occasion the king, the Princesses Mary and Anne, and the Duchess of York were his guests, and from a canopy of State in front of the house they viewed the civic procession as it passed along Cheapside on its way to Guildhall. Sir Edward was married three times. He died at Pinner in 1705, aged 75, and was buried at Harrow. The last descendant of the family died in 1840, when the race became extinct. The name of Waldo had, however, been taken in 1850, by royal sign manual, by Mr. Edmund Wakefield Meade, of Dawlish, son of Francis Meade, of Lambeth.

Edmund Meade Waldo became resident at Stonewall Park, near Hever Castle, which memorable edifice is still in possession of the family. He married Harriett, second daughter of Colonel Rochford, M.P., by whom he had two sons and one daughter. The eldest son and heir is Mr. Edmund Waldo Meade Waldo.

The daughter, Harriet Dorothea, was married in 1850 to the Rev. W. W. Battye, rector of Hever, to which living he was presented by his father-in-law. Captain Sebright informs me that the castle has never been uninhabited since the thirteenth century.

There are few ancient houses in the kingdom more deeply interesting to the visitor than Hever. It does not, however, convey ideas of grandeur or magnificence. It was a stronghold, and a place well calculated for safety in the troublous times in which it was built and embattled. Hepworth Dixon says:—"Hever was poetic and retired. Not many paces off the river Eden brawled and chafed among the stones. Grassland and woodland stretched on every side, here swelling into mound and ridge, there dropping into flat and marsh. Woods of oak encompassed the castle, with only here and there a break in sunny patch and leafless hill. Some rare and famous nooks lay screened amidst these depths of wood. In and out among these woodlands, becks and rivulets sang their pilgrimage towards the sea; sweetbriars grew in every hedge, and linnets built in every copse. The pools were rich with lilies, and the air, though laden with the scent of many herbs, was freshened by the salt of neighbouring seas." It is sur-

rounded by a moat, across which a bridge leads to the entrance gateway. The entrance is defended by a strong portcullis, composed of several large pieces of wood laid across each other like a harrow and rivetted throughout with iron. It was designed to be let down in case of surprise and when there was not time to shut the gate. To this succeeds an iron portcullis; it is followed by an inner solid oaken door, rivetted with iron, firmly bound with iron pieces going the whole length across and studded with iron knobs; a wooden portcullis then follows.

Immediately adjoining these are two guard-rooms, in which a dozen men at arms might long dispute the passage of an enemy. Over the external gate, and directly under the battlements, a series of machicolations project boldly forward; from these molten lead and other deadly appliances and missiles could be poured and discharged, with terrible effect, on the heads of assailants. Passing through these gates, and beneath the portcullises, we enter a spacious courtyard, surrounded on all sides by the building. From this courtyard or quadrangle we enter the old dining-hall, where the racks for hunting spears are still visible, and where we notice the very grotesque decorations.

In the stained-glass windows are the arms of the Boleyns and the Howards. Near this is the chapel, and continuing along the passages are two rooms bearing the names of Anne Boleyn's bedroom and Anne of Cleves's room. Anne Boleyn's room is really an interesting apartment, beautifully panelled, and contains the original family chairs, tables and muniment box, and what is called Anne's bed. It was in the bay window of this room where Anne used to sit to watch for the coming of the king. The church was the only building which could be seen from Anne's room. To this apartment several ante-rooms succeed, and the suite terminates in a grand gallery, occupying the whole length of the building, in which the judicial meetings and the social gatherings of the ancient

family were held. It is about 150 feet in length by 20 feet in width, with a vaulted roof and panelled throughout with carved oak. On one side, placed at equal distances apart, are three recesses. The first, having a flight of three steps, is fitted up with elbowed benches, where the lord of the castle in old times held his courts, and where Henry VIII. is said to have received the congratulations of the gentry when he visited the castle. The second recess was occupied by the fire, and the third was used as a quiet corner for the old folks, while the younger ones frolicked throughout the mazes of the dance. At one end of the gallery a trap-door leads to a dark chamber called the dungeon, in which the family are believed to have taken shelter in time of trouble. It is said Henry VIII. cast Anne into this dungeon to be starved to death. Another authority says she was put into a chamber in one of the towers, now entered by a secret sliding panel, still called Anne Boleyn's panel.

The Gothic tracery over the fireplace is extremely beautiful both in design and execution. It consists of two angels, each bearing two shields, showing the arms and alliances of the Cary and Boleyn families, of Cary and Waldo, Boleyn and Howard, Henry VIII. and Boleyn.

In conclusion, I wish to express my best thanks to Captain Sebright for his courtesy and great kindness in giving us permission to visit the castle, and also for the trouble he has taken in personally showing us over this historical site.

Hever Church contains the marble tomb of Sir Thomas Boleyn, Anne's father, and also brasses of Margaret Chene and John de Cobham.

Chiddingstone, called Ciding Stane in the *Textus Roffensis*, is supposed to take its name from a huge boulder at the back of the village upon which the priest used to stand whilst chiding wrongdoers, or some say the delinquent was placed upon it that all might see the offender.

The illustrations are from photographs by Mr. Arthur Quartermain.

### DR. JOHNSON'S BIRTHPLACE.

THOUGH Lichfield has always been proud in the possession of the birthplace of the famous Dr. Johnson, it is only recently that the quaint old house standing in the Market Place has become the property of the Corporation to be preserved as a memorial of the cathedral city's most distinguished son. Since it was occupied by the old books of Michael Johnson, amongst which the doctor spent many happy hours in the days of his childhood, the place has, says the *Birmingham Daily Post*, passed through many vicissitudes. It was, perhaps, scarcely fitting that a tinman's wares should have occupied the ledges and shelves where the dusty books of Michael had formerly reposed; but a worse change was yet to come, for when the vendor of the tin goods gave up his business a draper recognised the importance of such a well-situated establishment, and the old shop was converted into a drapery warehouse. Not content with the unobtrusive window behind the pillared portico which had amply served the bookman's purposes, the draper availed himself of the space afforded by the projection of the upper storeys over the lower one to increase the size of his shop by erecting a large bay window between two of the pillars. This modern addition to an old and famous building must have shocked the susceptibilities of many a visitor to the ancient city of Lichfield, whether he were an admirer of Dr. Johnson or not. It is therefore gratifying to record that about twelve or fifteen years ago the hideous shop-front was removed and the house restored somewhat to its original condition. This happy circumstance was due to the late Mr. J. H. Johnson, of Hallgarth, Lancashire. Apparently he was not connected with the great family, but he was a relative of the late town clerk of Lichfield (Mr. Hodson), and it was through the latter gentleman that Mr. Johnson was made acquainted with the condition of the house. He purchased it with the intention ultimately of giving it to the authorities in Lichfield; meanwhile it was occupied by private families—latterly by a dentist—but after Mr. Johnson's death his executors offered it to the Lichfield Corporation for a nominal sum only, to cover the expenses of the restoration. It was then—about a year ago—that Lieutenant-Colonel Gilbert came forward and found the necessary money, and the house became the property of the Corporation. Some 200*l.* has been spent in repairing the roof and in other structural alterations. In course of time the house will be made—as far as it possibly can be done—similar to its appearance at the time when occupied by the Johnson family. There is, for instance, an unsightly modern side window overlooking Market Street which will have to be brought more in accordance with its surroundings. Of the interior of the house Michael Johnson's shop has suffered more than any of the other rooms. The wall-paper here will, no doubt, receive the attention of the authorities, for the present covering of the walls is hardly in keeping with the character of the house. Other minor details will also be put right in due course.

Though the house was only opened to the public at Whitsuntide, the Johnson house committee have in response to their appeal received numerous gifts and loans of Johnsonian relics, while souvenirs of Johnson which were formerly kept in the Lichfield Museum have been removed to the new home. Thus a Johnson museum and library has been formed with a collection of objects which cannot fail to interest and attract all visitors of literary taste. The public have access to two rooms on the ground floor—the library and Michael's shop. In the latter are two very interesting curios—the doctor's great armchair and his portable desk. The original covering of the chair, which was used by him in his last illness, is retained. An added interest is attached to the desk because on it the celebrated man wrote some of the "Rambler" when on a visit to his friend, the Rev. John Hoole. These gifts are sent by the Hoole family, who have largely contributed to the museum. Visitors are also allowed in the two rooms on

the first floor—one a small bedroom and the other the birth-room of the great man. The latter is a large apartment kept in its original condition, and it contains manuscripts and relics too numerous to mention, carefully preserved in glass cases. Johnson's signature is seen on a mortgage for securing 80*l.* given by Dr. Johnson and his mother to T. Levett. It is dated January 31, 1739. Then there are articles of agreement made on the marriage of Michael Johnson with Sarah Ford, June 11, 1706. The lexicographer's big cane with ivory top rests alongside Garrick's silver-mounted malacca. Whether these are the walking-sticks used by the two friends when they set out for London is not stated. The silver pen given by Burke when the dictionary was finished also finds a place, while among many interesting relics lent by Mr. A. C. Lomax are the author's notebook and ivory tablet. Two silver spoons belonging to him, his dinner napkin ring, his Prayer-book containing pencil notes, and an autograph letter to Mrs. Lucy Porter, dated March 23, 1759, are also shown. The table upon which he used to breakfast, one of his chairs, and the cups from which he drank his favourite beverage, are contained among the articles in the birth-room. His signature is seen again in a Latin and English dictionary which he used when at school at the age of seventeen. He has calculated his age on a leaf inside the book by subtracting 1709, the year of his birth, from 1726, the date upon which he was using the dictionary. Many other things relating to the great man and his family are here collected, and near by at the Three Crowns inn, mentioned by Boswell, are two chairs which were used by the doctor at different times when he was a visitor there. Already there have been about 380 visitors to the house from all parts, and many travellers from America have recorded their names in the book. Opposite the house stands the statue of the doctor, and a few yards away is St. Mary's Church with its tall spire, where he was baptized.

### SUSSEX ARCHÆOLOGICAL SOCIETY.

THE fifty-fifth summer meeting of the Sussex Archæological Society was held on the 4th inst. at Midhurst.

At Singleton Church, says the *Sussex Daily News*, one of the oldest and most interesting churches of Sussex, the rector (the Rev. Hugh Hordern, M.A.) conducted the party over the building, and two short papers were read by Mr. Philip M. Johnston and Mr. R. Garraway Rice, F.S.A., the latter dealing with the altars, images, lights, &c., existing in the church in pre-Reformation times. Mr. Johnston confined himself to an account of the fabric. Singleton Church, which is believed to be dedicated to St. John the Evangelist, was built about the year 1000. It is thought it consisted at first of tower, nave and chancel, the aisles being added about 1150. The original Saxon tower is still standing, and Mr. Johnston described the material of which it is composed. In those days there was no "jerry-building" in church work. There is reason to believe that a still older church stood on the same site, so that Singleton Church has seen many generations of worshippers. It is of interest, in these controversial times, to note that 900 years ago devoted Christians gave for the maintenance of the clergy of the parish for ever a house, glebe land and tithes to the value of 50*l.* 6*s.*; but Mr. Hordern has shown that, so far from receiving any stipend, last year he was 11*l.* 5*s.* out of pocket—so that it actually cost him this amount to be rector. In the days of William the Conqueror Singleton was known as Sillestone, and, as indicating the transformation which has passed even over conservative Sussex, the following quaint entry in Domesday Book (A.D. 1085) may be quoted:—"Earl Roger holds Sillestone in demesne. Earl Godwine held it. It then vouched for [i.e. was taxed at] 100 hides, less 2 and a half. Now for 47 hides [i.e. as much as 47 ploughs could cultivate]. There is land for 40 ploughs. In demesne [i.e. belonging to Earl Roger absolutely] are 7 ploughs, and 80 and 6 villeins [i.e. slaves holding cottages] and 52 bordars [i.e. cottagers] with 33 ploughs. There are 17 serfs [i.e. personal slaves] and two mills of 12 shillings and 7 pence, and 60 acres of meadow and wood for 150 hogs. There is a church in which lie 3 hides and one rod of this land. The clerks [clergy] have 2 ploughs and 5 bordars." The name of a rector in the twelfth century has been discovered, and the list of rectors from 1410 is fairly complete. The list of churchwardens goes back to 1630; the registers of baptisms, marriages and burials to 1558; the present churchwarden is Sir Charles Grant, K.C.S.I., and the Duke of Richmond is patron of the living. Singleton Church contains some very curious monuments, and the rector has recently discovered the old staircase to the rood-screen. The screen itself has vanished.

The party drove from Singleton to Midhurst, where luncheon was served in the public hall, and a visit was then paid to the beautiful views of Cowdray House, built in the sixteenth century by Sir William Fitz-William, Earl of Southampton. It was one of the finest country houses of the period, and

was destroyed by fire in 1793. Mr. Michell Whitley acted as conductor of the party over the ruins.

After inspecting Cowdray the party walked through the park to Easebourne, where some time was spent in the church and about the views of the old Priory, which were described by Mr. Johnston. The most notable features of the church are the monuments to Sir Anthony Browne, first Viscount Montague, and his two wives (this having been removed from Midhurst Church in 1851), and Flaxman's lovely marble memorials to two members of the Poyntz family. There is also, now much worn, a canopied monument of Sir David Owen, knight-baronet, a natural son of Owen ap Tudor, who married Catherine, widow of King Henry V. The Priory was founded in the thirteenth century by John de Bohun, and its inmates were well-born or selected from gentle families. It continued to prosper and increase in lands and goods throughout the fourteenth century, and in 1332 a descendant of the founder endowed it with more land. In 1441 Bishop Richard Praty ordered a visitation of the Priory, and the record of this in the episcopal registers states that the nunnery was in debt, and that this was principally from "the costly expenses of the prioress, because she frequently rides abroad, and pretends that she does so on the common business of the house, but it is not so, with a train of attendants much too large, and tarries long abroad, and she feasts sumptuously and is very choice in her dress, so much so that the fur trimmings of her mantle are worth 100 shillings." The result of this visitation was the supervision of the prioress, but the state of the nunnery went from bad to worse, and Bishop Story's visitation in 1478 reveals grave scandals; a certain Sir John Smyth, chaplain, and one Style, a bond-servant to the Lord Arundel, had abducted two of the nuns, and the prioress had given divers jewels to Sir John Smyth. In 1536 the Act for the suppression of the smaller religious houses was passed, and Margaret Lackfield, the prioress, surrendered her office and the property of the nunnery to the King, she and her fellow nuns returning to the outside world. Lord Montague afterwards occupied the Priory as a private residence, and he was visited there by Queen Elizabeth, who was "most bountifully feasted," as she liked to be, and since that day the history of Easebourne Priory has been a blank. What remains of it is now the charming residence of Mrs. Yorke, through whose kindness the party were enabled to inspect the ruins and the lovely old garden.

The next visit was to Cocking, where the church was described by the rector, the Rev. H. L. Randall. This is another of the historic parish churches of Sussex. The village—or the manor—belonged in Saxon times to Edward the Confessor, and it was granted by William I. to the famous Earl Roger. In the time of Queen Elizabeth it came into the possession of Viscount Montague, and it has since been part of the Cowdray estate, now belonging to the Earl of Egmont. The Manor Farm, immediately to the west of the churchyard, was originally, Mr. Randall said, a small monastic building in connection with the church. The church was built in early Norman times—before 1100—and it had originally only a nave and chancel. The south aisle was added about 1300, in the Decorated style, and at this period the windows of the chancel were enlarged and the tower built. The north aisle is entirely modern, having been added about thirty-five years ago by the late rector, the Rev. R. D. Ash, who also built the schools and erected a new parsonage. The chancel was partly rebuilt and restored with reverent care by the present rector in 1896. One of the original Norman windows of the nave was discovered by Mr. Randall, and on one splay of this window is a very interesting painting of the Wise Men seeing the Star, the date of which is as early as 1220. It was probably the work of a monk. A piscina and aumbry in the south aisle and an Easter sepulchre in the chancel were also discovered. A gravestone in memory of James Barker, who was for twenty-eight years rector of the parish and also Archdeacon of Chichester, was discovered when the old pews were removed from the chancel; he died in 1736, aged seventy-one, and the inscription records that "he was content with his lot, yet not unworthy of a better one." From Cocking Church the party walked to the rectory. The party then drove back to Chichester railway station, and there dispersed, after one of the most successful summer meetings on record.

### THE ALLAN-FRASER ART COLLEGE.

ANOTHER important educational gift has been made to Scotland, writes a correspondent of the *Times*—an art college, offering gratuitous board, lodging and instruction to a limited number of students, under such conditions as to render the gift of peculiar grace and value.

The late Mr. Patrick Allan-Fraser, a wealthy Scottish gentleman, and an honorary member of the Royal Scottish Academy, died about ten years ago, leaving several estates the profits of which were to be applied to the maintenance as an

art college of one of them—Hospitalfield, a fine old country mansion-house. Hospitalfield, a very large house of great beauty, is built on the site of the old Hospice of Arbroath Abbey, and is charmingly situated near Arbroath. Mr. Fraser's scheme was this—that a limited number of young men of marked ability, who have insufficient means of their own, should reside in the house, and receive free hospitality and instruction for four years; that they should enjoy home life in beautiful surroundings, about ten minutes' walk from the sea, recreation being duly provided for—cricket and lawn-tennis in the private grounds of the house, and golf on the links by the shore, approached by an avenue of trees. New studios are now being built for the students near the house, and it is arranged that every possible opportunity for study will be afforded. The study will be of the usual kind—the figure, draped and undraped, the antique and landscape in the grounds and the country surrounding. There is also a good picture-gallery in the house.

The trustees have appointed Mr. George Harcourt, of Bushey, as governor, to conduct the schools in accordance with Mr. Allan-Fraser's elaborate deed of bequest. Students of "marked ability" must be within the ages of sixteen and eighteen when they apply for admission, and must be "of sound physical condition;" accepted students (those whose submitted works have been approved) are to be admitted as probationers for the space of three months, at the end of which time, if they be not approved, no charge will be made upon them for any cost of maintenance, &c. The understanding is that only students who intend making art their profession are eligible as candidates. The college session is thirty-six weeks, divided by a long and a short vacation. The will—or deed of settlement and mortification (dated 1873, with codicils 1874 and 1876)—contains many curious and interesting points, some of which may be cited, for the whole scheme has been very deliberately and wisely matured. Of the nine original trustees, only three, we believe, now survive, but the testator has nominated as continuation trustees the sheriffs and conveners of the counties of Forfarshire and Perthshire, the presidents for the time being of the Royal Academies of London and Scotland, the secretary of the latter, the provost of Arbroath, or failing them such trustees as may be appointed by the Lord Advocate of Scotland.

The arts to be cultivated are painting, sculpture, carving in wood, architecture and engraving. This is the "first main purpose of the trust." The second main purpose was to provide for aged or infirm professional men; but the realisation of this object has been prevented by Mr. Fraser's outlays subsequent to his execution of the will. Thirty pupils were to be taken, but the number must be reduced for a similar reason. The trustees have the power to bind the students apprentice for the period of four years, but it is doubtful whether they will exercise the right. The salary of the governor is to be 400*l.*, with further allowances; he is to reside in a wing of the house, and has full power and control, under the trustees, over the whole management. There are specific and often curious provisions as to cultivation of the home farm, the dress and comportment of the students, medical supervision, religious worship (of the most liberal character), the possible extension of art instruction to "young people resident in Arbroath," the requisition of diploma works from students, annual prizes for proficiency, art lectures upon art and science by outside lecturers, travelling scholarships to successful students, and various charitable and public-spirited benevolences, as from the Art College, should the funds of the trust permit. These are but a few clauses in what is practically a deed of administration—a document conceived in the most liberal spirit, and one from which (in spite of the numerous details which the foresight of the testator has dealt with) the "grip of the dead hand" is conspicuously absent.

It should be added that, although this is a Scottish gift to Scotland, English and Irish students are equally eligible to benefit under the trust. It is intended that the first session shall begin in October next.

### ARCHITECTS' FEES.

AT the Sussex assizes on the 4th inst. Messrs. Pigott & Oxley, architects of St. Leonards, sued Mr. Meads and others to recover fees for services rendered in preparing plans and quantities, getting out tenders and work generally, the amount claimed being 85*l.* 15*s.* 3*d.*

Mr. Charles Archer Pigott said he sold six plots of land on behalf of Mr. Brooks to Mr. Whiteman. In the year 1898 witness met defendant Meads, who asked witness if he could have one of the plots. Witness said he would try to arrange with Mr. Whiteman, and Mr. Meads entered into a building agreement with the owner on January 17, 1898. In the latter part of the year witness met Mr. Meads, and a conversation took place with regard to the plans and drawings of a villa. It was arranged that witness should prepare plans, specifications

and quantities at 5 per cent. on the whole outlay inclusive, the only extras being his expenses. On October 31, 1898, Mr. Meads came to his office and brought with him a rough sketch. The cost was to be 1,200*l*. Witness looked at the sketch and said it would be impossible. Mr. Meads asked witness to get out a proper sketch. Witness did so. Mr. Meads wrote to witness on November 6, 1898, saying, "I think the plan will do very well." On November 7, 1898, Mr. Meads came to witness's office with the plan. Witness showed him a proper drawing, saying defendant could not possibly expect the villa to be erected for the sum named, 1,200*l*. Witness then got out quantities and prepared specifications, sent them to London, and issued them to various builders and obtained various tenders. On December 13, 1898, witness received some tenders and opened them in the presence of Mr. Meads. The lowest was for over 2,000*l*. Defendant said he was not prepared to pay so much money, and asked witness to reduce the plans and alter the style of the work and material, so as to get it down as low as possible. Witness told him he thought they might reduce it to 1,600*l*. Witness received a letter from Mr. Meads on December 14 in which he stated he had talked the matter over with Mrs. Meads, and she was willing for certain alterations to be made. On January 17 witness saw Mr. Hatton, who had submitted the lowest tender, and Mr. Hatton arranged to carry out the work. Defendant would not allow witness to reduce the size of the rooms. On April 14, 1899, witness sent in his account to the defendant with particulars. On December 19 Mr. Meads asked for a month to pay. At the end of the month witness sent in his account, and subsequently put the matter in the hands of his solicitors. His charges were fair and reasonable.—Cross-examined: Originally the price was not to be more than 1,200*l*. But it was not correct that this price was adhered to all along. Mr. Meads said he wanted expenses kept as low as possible.

Mr. Oxley, one of the plaintiffs, bore out the evidence given by his partner, Mr. Pigott, as to interviews when Mr. Meads brought the sketch and returned the plans. The plaintiffs had definite instructions to go on with the plans.

This closed the case for the plaintiffs.

Mr. William Meads, a dentist, of Bexhill-by-Sea, said he had to pay just over 700*l*. for the freehold. Witness asked Mr. Pigott what he could have a house built for, and Mr. Pigott said for any sum. Witness said he did not want to spend more than 1,000*l*. Witness got out a rough sketch, and Mr. Pigott thought it would do very well with a slight alteration. Neither Mr. Pigott nor his partner suggested that the building would cost more. Witness afterwards said, "Keep as near as you can to 1,000*l*., only don't go over 1,200*l*." Mr. Pigott said, "Very well." Witness said as a kind of joke, "None of your hankey-pankey tricks; don't run me up a big bill, for I won't pay it." On the night before the tenders were sent out, witness had a special interview with Mr. Oxley, and asked him if they had everything down. Mr. Oxley said he thought so. Afterwards witness said he could not be quite certain whether they could get it for their 1,000*l*., but he thought they were well within the mark. Defendant said that that being so he was willing to go forward, but he would not undertake it if there was any doubt. Mr. Oxley again said he thought they were well within the mark. Witness was dumfounded on the receipt of the tenders. Mr. Pigott admitted that he had been a little extravagant about the stone, and said they must try to bring it down. Witness said he could not entertain a house of that description, as he would never get rent to cover it. Witness said on several occasions that if Mr. Pigott could not reduce the amount of 1,200*l*. he would not go on. The sum of 1,500*l*., which was not to be exceeded, mentioned in the letter of his in which witness said he had consulted with his wife, was the sum mentioned by his wife, who objected to witness building on the front. The sum was quite against witness's inclination, and he afterwards said he could not exceed 1,200*l*.

At this stage the case was stopped by his lordship, and judgment given for the plaintiffs for the amount claimed.

secretary. The party left Shrewsbury by the 11:25 A.M. train for Bridgnorth, and on their arrival there entered three brakes and proceeded to visit the following places:—Billingsley Church, where the rector (Rev. J. L. Williams) showed the early Norman doorway, fourteenth-century porch, Easter sepulchre and early font; Sidbury Church, where was seen some splendid herring-bone work, Norman west doorway, traces of wall-painting, Norman font, eighteenth-century Creswell chapel and monuments, and collecting box dated 1637, and the old manor house of the Purslowe and Creswell families adjoining the churchyard; Stottesden Church, where the vicar (the Rev. W. Murcott) showed Saxon work in the west wall, Norman base of tower and arcade of north aisle, Norman font and Jacobean pulpit; Aston Boterell Church, where the rector (Rev. E. F. Lipscomb) pointed out the Transitional Norman work in the chancel, the Early Decorated arcade, the Transitional font, a fifteenth-century incised slab, a table tomb (probably that of John Boterell and his wife, Elizabeth Trowe, c. 1600), and the adjoining manor house of the Boterells, which still possesses a fine plaster ceiling of 1576, and the site of the earlier castle of the Boterells in a neighbouring field. Then the party walked to Burwarton, and had tea at the Boyne Arms, driving afterwards to Bridgnorth and there catching the train for Shrewsbury, which was reached at nine o'clock. The arrangements for the day were made and most successfully carried out by a sub-committee and Mr. Goyne, the secretary.

### LINCOLN AND NOTTINGHAM ARCHÆOLOGISTS.

THE members of the Architectural and Archæological Society of the counties of Lincoln and Nottingham made an excursion in the neighbourhood of Boston on the 2nd inst., and spent a pleasant and profitable day in several of the villages near to the town of the "stump." The party included the Rev. A. F. Sutton, Brant Broughton; Canon Hemmans, Holbeach; the Rev. J. P. Cheales, Miss G. Cheales and Miss K. G. Cheales, Friskney; Mr. C. Hodgson Fowler and Mrs. Fowler, Durham; Mr. W. H. Ellis, London; the Rev. W. O. and Mrs. Massingberd, Ormsby; Mr. and Mrs. Hunt and Mrs. Brough, Salop; Mr. S. Simpson, Boston; the Rev. A. S. Penny, Wispington; the Rev. C. Y. and Mrs. Mitchinson, Skirbeck Quarter; Canon Stephenson, Boston; the Rev. W. T. Fielding, Boston; the Rev. R. E. Cole, Donington; the Rev. A. Hunt, Lincoln; Mr. E. Burchall, Leeds; Dr. and Mrs. Perry, Spalding; the Rev. R. W. Cracroft, Harrington; Mr. G. S. W. Jebb, Boston; the Rev. W. Y. and Mrs. Smythies, Algarkirk; the Rev. A. Lambert, London. Mr. G. S. W. Jebb had charge of the local arrangements. The excursionists assembled in Boston in the morning, and, under the escort of Mr. Jebb, visited the parish church, the old town hall, the Grammar School and other places of interest. At noon waggons started from the town bridge, and the party proceeded to Swineshead, and thence to Bicker, Donington, Quadding and Wigtoft, and at each place the churches and several objects of archæological interest were inspected. Boston was reached on the return journey at about half-past seven o'clock, and after dinner at the Red Lion a public meeting was held in the Guildhall, at which Mr. Jebb read a paper.

### PUBLIC HOUSES AND THE BUILDING ACT.

IN the Court of Appeal the case *Dicksee v. Hoskins* was considered. It was an appeal from the judgment of a Divisional Court, the Lord Chief Justice and Mr. Justice Lawrance, on a special case stated by a metropolitan police magistrate on allowing an appeal under the London Building Act, 1894, from a notice of objection to a proposed building served by the appellant, who was a district surveyor under the Act, upon the respondent, who was a builder. The case is reported in 17 the *Times* Law Reports, 446. The question was whether the proposed building was one to which section 74, subsection 2, of the London Building Act applied. That subsection provides as follows:—"In every building exceeding ten squares in area used in part for purposes of trade or manufacture and in part as a dwelling-house, the part used for purposes of trade or manufacture shall be separated from the part used as a dwelling-house by walls and floors constructed of fire-resisting materials." The proposed building was the re-erection of an old beerhouse. It would, when built, exceed ten squares in area, and was intended to contain—in the basement, beer and wine cellars; on the ground floor, a bar, public lobby, saloon bar, private bar, parlour and a public room; on the first floor, a sitting-room, three bedrooms and a kitchen; and on the top floor, attics. It was intended to be licensed and used for the sale of wine and beer to be consumed on or off the premises under the Beerhouse Act, 1830, and the Refreshment House

### SHROPSHIRE ARCHÆOLOGICAL SOCIETY.

THE annual excursion of the Shropshire Archæological and Natural History Society was held on the 4th inst. in delightful weather. The programme included a visit to a very interesting part of Shropshire, and the outing was thoroughly enjoyed by those who were present. The attendance included the Rev. T. Auden, Mrs. and Miss Auden, Mr. W. Beacall, Mr. Cooper, Miss Downward, Miss Mary Lloyd, the Rev. O. M. Feilden, Mr. S. Jackson, Miss Jeffreys, Mr. J. Nurse, Mr. T. Roberts, Captain Stretche, Mr. Herbert Southam, the Rev. J. G. Swainson, Mr. R. and Mrs. Taylor, Captain G. Williams-Freeman, Miss Williams-Freeman, Mr. William Phillips, the Rev. C. H. Drinkwater and Mr. F. Goyne,

Act, 1860. The trade of the beerhouse was to be carried on on the basement and ground floor, and the licensee and his family were to reside in the upper floors of the building. The whole of the building was to be covered by the justices' certificate and Excise license. The floors separating the ground floor from the first floor and the staircase leading to the first floor were not intended to be constructed of fire-resisting materials, and the learned magistrate found that, if subsection 2 of section 74 of the London Building Act applied to the building, the provisions of that section would be contravened. The learned magistrate also found as a fact that the basement and ground floor of the building were intended to be used for the purposes of the trade of a beerhouse, and that the part above the ground floor was intended to be used as a dwelling-house for the licensed occupier, but held that the case was governed by the decision in *Carritt v. Godson* (1899, 2 Q.B. 193), and allowed the appeal and overruled the objection of the district surveyor. The district surveyor appealed to the Divisional Court, and they dismissed the appeal. He now appealed to the Court of Appeal.

Mr. Avory, K.C., and Mr. Rowsell appeared for the appellant; Mr. Danckwerts, K.C., and Mr. Craies for the respondent.

The Court allowed the appeal.

The Master of the Rolls said that personally he did not agree with the findings of fact found by the learned magistrate, but he was bound by them. The magistrate seemed to him to be inconsistent in finding as he had done and also holding that the case was governed by *Carritt v. Godson*. But, accepting the findings, it followed of necessity that the appeal must be allowed.

Lord Justice Vaughan Williams said he concurred reluctantly.

Lord Justice Stirling also concurred.

### THE HOUSE OF COMMONS.

THE select committee appointed to consider whether any, and what, arrangements can be made to improve the accommodation provided for the general use of members of the House of Commons have agreed to the following report:—

Your committee have taken into consideration various representations which have been made to them as to the requirements of members for additional or improved accommodation, and they have also received evidence on certain general matters concerning the arrangements of the House, connected with questions of accommodation. Your committee proceed to state the requirements *seriatim*, with the recommendations which they make in each case.

#### 1. Smoking-room Accommodation.

It has been given in evidence, and indeed it is matter of common knowledge in the House, that the members' smoking-room on the main floor is always inconveniently crowded and very hot. The heat cannot altogether be avoided owing to the position of the room immediately over the kitchen, but it is hoped that it will be lessened by the means suggested below for reducing the temperature of the kitchen. The committee recommend that the present members' smoking-room be used as the strangers' dining-room, that the present middle dining-room be reserved for members only, and that the third dining-room, next the House of Lords, be used as a smoking-room.

There can be no doubt, however, that a large increase in the smoking-room accommodation is urgently called for. At the present time there are several rooms on the Terrace front and adjacent corridors vacated by Ministers who have removed to rooms in the late residence of the Clerk of the House; and it is possible, by making a few other reappropriations, to construct on this floor, beyond the present strangers' smoking-room, a series of three large rooms of the size of the last named, each measuring about 47 feet by 25 feet and 13½ feet high, fronting the Terrace. These rooms would form a suite separated by doors, with access also to each from a corridor running the whole length of the library corridor above.

Your committee advise that the two nearer rooms should be appropriated for members' smoking-rooms, and the furthest or most northern room for a members' reading-room.

Incidental to these alterations would be the removal of the bath-rooms and of the chaplain's room, as well as of the bar by the strangers' smoking-room, and the diversion of the staircase leading to the Ministers' corridor above. The members' staircase to the Terrace might advantageously be widened and improved. The baths could most conveniently be placed in the room now occupied by a Minister next the dressing-room, with which a communication could be opened; there would be space here for three baths, which ought to be sufficient. These alterations will entail the displacement of the two Ministers now occupying rooms on the Terrace front, and also of the two librarians. The librarians might be moved into the two rooms now occupied by the Parliamentary Secretary to the Local

Government Board and by the still-room maids. By a diversion of the passage and entrance from under the adjacent archway the small rooms there could be enlarged, and suitable accommodation obtained for three of the five Ministers displaced, the other two Ministers being moved to rooms now vacant on the upper floors. The chaplain and the two clerks-assistant could be given dressing-rooms on the mezzanine floor, as hereinafter stated.

Opportunity should be taken to fit up bookcases in the new smoking rooms and corridor for the accommodation of the ever-increasing number of books in the library, where no further space is available.

The various works required under this head will, including furniture, cost about 13,300*l*.

#### 2. Dining-rooms.

Your committee hear on all sides that great inconvenience is occasioned to members for want of more dining accommodation. It has been given in evidence that 300 dinners are served upstairs on a Government night, while there is room for only 140 diners on that floor, and that members have to wait some time for their turn at the tables. It does not appear that, if strangers were excluded from the upper dining-rooms, there would even then remain sufficient accommodation for members. The plans submitted to the committee show two new dining-rooms on the Terrace front, to one of which ladies would be admitted. There will still remain the three existing small dining-rooms for ladies. In connection with these, a ladies' retiring-room can be provided. The present members' smoking-room on the Terrace is absorbed in these rearrangements, which have the approval of the kitchen committee. The cost, including furniture, is estimated at 6,350*l*.

#### 3. Kitchen.

The accommodation is found to be in some respects insufficient and the ventilation unsatisfactory. Certain rearrangements and alterations in the kitchen department have been pressed for by the kitchen committee. The improvements which they have suggested are detailed in an Appendix, and the plans show how the works can be carried out. By an alteration of some of the fittings and methods of heating, it will be practicable to modify the high temperature prevailing in the kitchen. One of the requirements is that of a refreshment-bar for the messengers and subordinate staff of the House only, where they may obtain refreshments at a cheap rate. A petition, signed by upwards of 100 persons, has lately been presented to the kitchen committee asking for this accommodation, which might be provided in what was the servants' hall of the late residence of Sir Reginald Palgrave or the space adjacent. The cost of these works will be about 950*l*.

#### 4. Ladies' Gallery and Upper Floors.

The need for a larger refreshment-room for the ladies in the gallery has been often pressed on the kitchen committee. This should, in the opinion of your committee, be provided by adding to the existing room that next to it, which is now used by the *Times* reporters.

Several complaints have been made to us of the defective ventilation of the ladies' gallery. The question is complicated by the gallery being, for ventilation purposes, a part of the chamber of the House; but suggestions have been made for improvements which are commended for further consideration and experiment.

Your committee are convinced that better accommodation is required on the committee-room floor to enable witnesses and others attending public committees on business, to the number, it is stated, of 1,800 in a day at times, to obtain refreshments. By fitting up a refreshment-room in the place now used for the deposit of hats and coats, and cloak-rooms where refreshments are now sold, a much more adequate arrangement would be effected.

There are on the mezzanine floor opening out of the ladies' gallery staircase seven rooms of which little use is made except by the staff of the Serjeant-at-Arms for waste paper, storage, &c. These rooms, if rearranged and fitted up as proposed in plans submitted to your committee, with the windows enlarged, would, in their opinion, make serviceable offices and rooms for the chaplain, the clerks of the House, and others displaced.

The works and furniture under this head are expected to cost about 1,350*l*.

#### 5. Various Requirements.

A new water-closet and lavatory in the small waiting-room adjoining the smoking-room on the main floor have been asked for, and might be advantageously provided at a cost of 200*l*., but this would entail the removal of the police, for whom it is desirable accommodation should be secured.

Representations have been made to your committee on the crowded state of the tea-room and adjoining newspaper-room at certain times. Probably, however, the proposal to appropriate one of the new large rooms downstairs as a reading-room, as well as a rearrangement of the furniture, will go far to remove this complaint.

Suggestions have been made that more convenient accommodation is required for typewriting. As regards the situation of the present rooms, it appears to your committee that any disadvantage due to distance is counterbalanced by the comparative privacy of the rooms and their accessibility to the lady typists, who have not to pass through the inner precincts of the House. More space, however, is evidently required, and it is recommended that the adjoining conference-room F should be added to the typewriting-rooms. The heat of the rooms should be mitigated, if possible, by fitting outside blinds. The estimated cost of these works is 50*l*.

As regards accommodation for conferences and deputations, and for members' private secretaries, your committee desire to point out that the large committee-room at the north-west corner of Westminster Hall is very little used, and that it is available for these purposes on all but the very rare occasions when it is occupied by grand committees. The accommodation for lady secretaries has been considered, but it is regretted that no suggestion for affording additional space appears to be feasible.

Complaints have been made that there is an inadequate number of private lockers for members. It appears, however, from the evidence of the Serjeant-at-Arms that the deficiency is very small, and there is no doubt that it can be conveniently supplied.

A very considerable addition was made last year to the accommodation in the reporters' rooms, but there still seems to be need for more space for dining. This is a matter involving, it is understood, some structural difficulty and expense, and the committee recommend that the matter should be considered.

The accommodation now given to the telegraph operators and their assistants is quite inadequate, the present overcrowding being prejudicial to the health of the large staff employed. Your committee would recommend that the three rooms immediately under the present telegraph office, now used by the doorkeepers of the House of Lords, should be allotted for the use of the telegraphic staff, the doorkeepers being accommodated in the rooms now occupied by the assistant engineer, who would be moved into the ground floor of the late residence of the librarian of the House of Lords. These alterations have been rendered possible by the courteous consideration of the Lord Great Chamberlain, and of the officers of the House of Lords. The cost of these works is estimated at 450*l*.

A proposal was considered by your committee for constructing an additional storey on the top of the tea-room and reading-room. It would, to some extent at least, interfere with the light to the windows of the library corridor, and the need for it does not seem to be sufficiently urgent to justify the outlay involved.

Nor can your committee recommend the construction of a new smoking-room in the cloister court, which they think open to objections, æsthetic and other.

#### 6. Ventilation of Committee-rooms, &c.

Much inconvenience, and even danger to health, has been complained of as regards the ventilation of the committee-rooms. They are often crowded and a better supply of fresh air is urgently needed. Experiments have been tried by the Office of Works in two of them, Nos. 6 and 9, with a marked improvement in each case. Your committee recommend that the whole of the suite should be dealt with without further delay, so that the improvements may be completed before another session.

It may be here observed that there can be little doubt that the ventilation of the building generally would be more efficiently worked if all attendants authorised to control the heating of rooms, the opening and shutting of windows, &c., were under one jurisdiction, viz. that of the resident engineer.

Time has not enabled your committee fully to inquire into the general system of ventilation employed in the building, and they suggest that this would be a fitting subject for further inquiry at an early date.

#### Total Cost of Services.

With a suitable margin for contingencies which may well arise in carrying out extensive structural works, the total cost of the services recommended by this committee may be estimated at 30,000*l*.

The committee strongly urge that their recommendations should be carried out as soon as possible, in view of the fact that the present accommodation is quite inadequate for the large number of members who are in constant attendance for long periods at a time.

**Mr. Goscombe John's** colossal bronze statue of the late Duke of Devonshire is to be unveiled at Eastbourne on August 17. Permission has been given to the statue committee to proceed at once with the putting in of the foundations, in order that the concrete may have time to consolidate before proceeding with the erection of the statue.

## TESSERÆ.

### The Cavern Temple of New Grange.

ON plan New Grange resembles the upper part of a cross as the avenue does the stem. There are three recesses, one facing the avenue or gallery, and one on each side. In the one on the right is a large stone vase, which antiquaries have denominated a rock-basin. Within the excavated part of this large basin are two circular cavities alongside of each other, about the size of a child's head. Several also of the rude stones composing this recess are decorated with a variety of devices, circular, zigzag and diamond shape. Some of this latter pattern seem to be of superior workmanship, the squares being indented. Many of the stones on each side of the adit have smaller rude marks upon them, and one of them has spiral zigzags. The construction of the dome demands notice. The avenue or gallery leading to the area is formed by large upright stones, pitched perpendicularly in a row on each side, and thus they support the flat stones which form the roof. This covering rises gradually till it reaches the dome, which is not (like our modern cupolas) formed by keystones converging to a centre, but, after the manner of our staircases, each huge stone projects a little beyond that underneath it. A large flat stone at top makes the cove of it entire. The tallest of the stones forming the adit to the sacellum is 7 feet 6 inches high; its companion on the opposite side about 7 feet. The outward surface of the rock basin is about 3 feet 6 inches high and 3 feet 2 inches deep.

### Primitive Forts.

The ancient *din* or *dinas* and the Irish *dun*, as the words import, were the alarm posts in which the inhabitants of a district assembled in time of invasion—an event that rendered the construction of a proper and secure receptacle for that purpose absolutely requisite. *Din* signifies "what surrounds," i.e. an entrenchment. From this name of the British citadels we have the Roman *dinum*, *dinium* and *dunum*, and also the tune, *don*, *ton* and *town* of the Saxons. *Dun* is the same word in the Belgic dialect, whence it was principally used in England and Ireland. In this species of fortification the ancient Britons and Irish lodged their wives and children, and into it drove their cattle from the low adjacent country on any sudden invasion. Here they formed garrisons and made their stand, and from hence they sallied forth with confidence to repel the foe. Such fortresses were generally constructed on the most lofty hills, which, though from want of water untenable for any great length of time, were from the same cause subject to much wet, and thence enabled the warriors for a certain period to defend themselves. The *dinas*, therefore, of necessity was the strongest kind of fortification, and we consequently always meet with it strengthened by several ramparts as a fixed place of security in case of danger. The *caer*, in contradistinction to the *dinas*, seems to have been the name applied to such entrenchments as were thrown up on the march or retreat of an army, where time would not permit a fortification of more studied and laborious construction. We therefore generally find the *caer* consist of one single vallum and ditch.

### The Savoy in 1691.

Among Wren's employments as Surveyor-General under the monarchy of William III. was a command to ascertain and report to the Privy Council upon the buildings and other properties formerly occupied by the Jesuits and Benedictine monks in the precincts of the ancient Savoy Palace in the Strand, which he reported to consist of "a building called the Jesuits' College, 212 feet along the river Thames and 27 feet broad, adjoining the house, now Henry Allen's to the eastward, and to the house now possessed by the widow Salisbury to the west." The tower at the east end of the college, about 36 feet square, was then debased to a laystall and public house of office, and the Jesuits' chapel which adjoined the college on the south, and the military hospital or barracks, so appropriated by Evelyn in the im politic war with Holland, on the north, with an office for the priests, a kitchen, with offices and yards, for the fraternity, &c. There were also two empty houses, recently occupied by the Benedictine monks, which extended from the college to the hospital. To such base uses had the college of the Jesuits and the monastery of the Benedictines in the Royal Palace of the Savoy descended.

### Symbolical Patterns.

In the earliest dawn of civilisation the arts were the repositories of the myths and mysteries of national faiths. Embroidery was one of them, and the border which edged the garment of a divinity, and the veil which covered the grave of a loved one, or the flower-buds and fruit which fringed the hangings and curtains in the sanctuary, each had a meaning, and therefore a use. These symbolical designs and forms were constantly reproduced, and all human ingenuity was exercised in reforming, remodelling and adding perfect grace to the expression of the same idea. The cross was a sign and

a pattern in prehistoric art. It was the double of the Tau, the Egyptian emblem of life; and while the Jews reject the Christian cross, they still claim to have warned off the destroying Angel by this sign in blood over the lintels of their doors in the first Passover. The gamma was the sacred letter of the Greeks; and arranged in different forms had different meanings. In the second form it was called the gammadion, and under this name was woven into stuffs for ecclesiastical use as late as the thirteenth century. Can any invention of man show more intention than the wave-pattern? The airy leap drawn downwards by the force of gravitation; controlled, and again made to return, but strong to insist on its own curve of predilection, rushing back under the same circle; strengthened by the downward movement to spring again from its original plane; beginning afresh its Sisyphus labour, and facing the next effort with the same grace and agility. Undying force and eternal flowing unrest—these are the evident intention of the wave-pattern. There is near Bologna an ancient Phœnician burial-place. Many of the strangely formed tombstones have the wave-pattern roughly carved upon them. It is to be found wherever their universal commercial activity led them. Perhaps the pattern was sacred to the Phœnicians, who were always being borne over the sea, and to whom the wave must have been most familiar and significant.

#### Chinese Architecture.

The columns and rafters used in the construction of Chinese houses are rather the bars of a light cage than the support of heavy weights—the perpendicular beams serve less to support than to unite the cross timbers or horizontal rafters. The framework of the roof is only a light fabric of bamboos placed one above another, supported by ledges and diminishing in size as they rise. The ends of these transverse rafters rise either out of the column which they cross, or from the walls themselves, and sustain that part of the roof which overhangs the building. Columns in China have no capitals; two reasons have prevented the adoption of this universally admitted part of the pillar. The first consists in the absence of both architrave and entablature; the second in the use of double roofs. The first or lower roof being generally only a lean-to or pent-roof, the slope of which necessarily conceals the height of the column, every species of figure, whether for use or ornament, not only appears superfluous, but has not perhaps entered the mind of the architect. Bricks are made in great perfection; the Chinese join them together beautifully, so as to form triangles, squares, circles, figures or flowers, &c., which gives to the exterior a very finished appearance. The bricks in size are about 10 inches long, 4 inches wide, and rather more than 2 inches thick. A one-brick wall will therefore have a hollow of 2 inches between the stretchers of its two faces. Those of the Great Wall are reported as being 15 inches long, half that in width, and nearly 4 inches thick. The walls of their houses are generally about 18 inches thick. On the foundations they lay three or four layers of bricks entirely solid. After which they dispose them on the two faces of the wall frontways and lengthways (as headers and stretchers) alternately, so that the front ones meet and occupy the whole breadth; but between those that are disposed lengthways there remains a void space in the middle of the wall. On this first range they lay a second, disposing the bricks lengthways, observing to cover the joints of the front bricks in the first range with a whole brick in the second, and so they proceed alternately from the bottom to the top, and by this means the expense both of labour and materials is considerably diminished and the weight of the wall much lessened. Marble is found in the province of Fokien, and is very common in those of Chanton and Kiangnan, which would equal the best in Europe if it were well polished; but they make little use of it in their public buildings. There is neither palace nor temple, nor any other edifice at Pekin or elsewhere entirely of marble. Though pillars are frequently used in their buildings, they have hitherto employed nothing but wood for that purpose. It is uncommon to see anything built even of stone beside bridges and memorial arches, which adorn the streets of the principal cities in each province; and marble is generally applied for pavements, thresholds of gates, the foundations of some of the pagodas and the lining of canals.

#### GENERAL.

**The King** has lent to Leighton House the picture by the late Lord Leighton, *Cimabue's Madonna being Carried through the Streets of Florence*, which was purchased by Queen Victoria in 1855.

**The King** has been graciously pleased to grant a warrant of appointment as lock and safe makers to His Majesty to Hobbs, Hart & Co., Limited, Arlington Street, Islington, and Cheapside, who held a similar appointment to Queen Victoria.

**Messrs. Clayton & Black**, of Brighton, the School Board architects, have designed some additions to the Southwick

Board schools, which are being erected by Messrs. Field & Co. builders, at a cost of about 4,000*l*.

**The Electing Trustees** of the British Museum have elected the Duke of Cornwall and York to the trusteeship recently vacated by the resignation of the King.

**Lord Wemyss** proposes to move in the House of Lords on Tuesday next:—That in the opinion of this House it is desirable that models of the proposed public buildings in Whitehall and Parliament Street should be made and publicly exhibited, as recommended by Professor Aitchison (late president of the Royal Institute of British Architects) and by the present president and council of the said Institute.

**Mr. J. S. Rogers**, the American locomotive engine builder, has left over a million and a half pounds as a legacy to the Metropolitan Museum of Art at New York. Should the museum not be able to accept the legacy as an endowment fund, the money is to go to other New York institutions.

**Baron de Baye** has offered to the Municipal Council of Paris a collection of ancient jewels and embroideries which he gathered in southern Russia, with a view to founding in Paris a museum of Russian art, as he has already done at St. Petersburg of French decorative art.

**The Directors** of the joint railway companies have accepted the tender of the firm of Sir John Aird to carry out the scheme of improving the Portsmouth Harbour station at an expenditure of 40,000*l*.

**It has been Officially** announced at Simla that the King has been pleased to offer to the Viceroy a series of paintings for the hall proposed to be built in Calcutta as the All India Victoria Memorial. They were executed by command of Her late Majesty, and illustrate important events in her life and reign.

**Miss S. Curtis** has bequeathed 1,000*l*. to the churchwardens of the parish church of Tamworth, Staffordshire, for the restoration fund.

**The Greek Government** has received an offer from Genoa to undertake a search for submerged objects of art off Cerigo, but in view of the exorbitant conditions suggested the offer has been rejected.

**The Committee** of the Bishop Creighton Memorial Fund have commissioned Professor von Herkomer, R.A., to paint a half-length portrait of the bishop for addition to the National Portrait Gallery, and a replica for Fulham Palace.

**Mr. Pearson Bellamy**, architect, has died at his residence in Tentercroft Street, Lincoln, in his 80th year. He was articled to the late Mr. Nicholson at Lincoln. Mr. Bellamy afterwards commenced business in Lincoln, and eventually entered into a partnership with Mr. Hardy, which had a long existence. He was well known as an architect in connection with town halls, corn exchanges and cemeteries. One of his chief buildings was the Ipswich Town Hall. His principal cemeteries were those of Leicester and Loughborough, while the Corn Exchanges at Hull, Lincoln, Grimsby and Retford are from his designs.

**The Tramway** from Pontorson to Mont Saint-Michel will be opened on July 28.

**The Society of Architects** propose to arrange for a summer excursion to Oxford on July 27, when Mr. N. W. Harrison will meet the party and act as leader.

**Efforts are being Made** towards the raising of a sum of 12,000*l*. towards the restoration of the cathedral of St. Davids. It is proposed to restore the eastern group of buildings, consisting of Bishop Vaughan's chapel, the vestibule of the lady chapel and the lady chapel itself, which is further east and is the largest and most important building of the group. It is also hoped that the work, which is, as before, under Mr. J. Oldrid Scott's direction, may include the removal of the inappropriate buttresses on the north side of the nave and some attempt to arrest the decay of what remains of St. Mary's College.

**The General Committee** of the Wykehamist South African War Memorial Fund has this week met in Lincoln's Inn Old Hall. The committee decided that the memorial should take the form of a new entrance gate into the school grounds from Kingsgate Street. It was resolved that the governing body should be informed of the scheme and their general approval should be requested.

**The Opening Ceremony** in connection with the Guinness Trust Buildings at Hammersmith will take place on July 17. The buildings are situated in the Fulham Palace Road, and two out of seven blocks are ready for occupation. Altogether accommodation will be provided for 400 families, and only bona-fide persons of the working class are eligible. They will be let in suites of one, two, three or four rooms, the rents being from 2*s*. 6*d*. to 6*s*. 6*d*. a week, according to position and number of rooms. The convenience of the tenants is to be studied in every way. Hot water will be supplied on each landing, store-room is provided for perambulators, a play-shed for the children and a reading and recreation room for the adults.

# THE Architect and Contract Reporter

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**CHELSEA.**—Oct. 1.—Competitive designs are invited for proposed new baths in King's Road, Chelsea. Premiums, 100 guineas, 50 guineas and 30 guineas respectively. Particulars at the office of the committee, 171 King's Road, Chelsea.

**MANCHESTER.**—July 31.—Competitive drawings are invited for a fire station, a police station and other buildings, to be erected on land abutting upon London Road, Fairfield Street, Commerce Street and Whitworth Street, at a total cost not exceeding 85,000*l.* Premiums of 300*l.*, 200*l.* and 100*l.* Lithographed plan of site and copy of conditions may be obtained on application to the City Treasurer, Town Hall, Manchester.

**PENZANCE.**—Sept. 1.—Competitive plans and estimates are invited for laying-out ground situate on the Western Promenade, to include a winter garden suitable for band and other concerts, and lavatory accommodation for ladies and gentlemen. Premiums of 21*l.* and 10*l.* 10*s.* respectively are offered for the best and second best designs. Mr. T. H. Cornish, town clerk, Public Buildings.

**SHEFFIELD.**—Aug. 31.—Plans and estimates are invited for the alteration of Eccleshall Church. The Rev. T. Houghton, Eccleshall Vicarage, Sheffield.

**TRADE NOTES.**

H.M.S. *Leviathan*, first-class cruiser, 14,150 tons, 30,000  
i.h.p., recently launched from the Clydebank shipyard of  
Messrs. John Brown & Co., is to have non-flammable wood  
used throughout for the constructional woodwork and fittings.

MESSRS. PERRY & CO., of 17 Grafton Street, Bond Street,  
have received the notification that the King has been graciously  
pleased to confer upon them the royal appointment of lustre-  
and lamp manufacturers to His Majesty.

MESSRS. COUSLAND & MACKAY, ventilating engineers,  
Glasgow and Manchester, are carrying out the ventilation of  
St. Thomas's Church, Henbury, near Macclesfield, by means  
of Mackay's patent direct-acting ventilators, of which they are  
the sole makers.

MR. HENRY DENNIS, of Ruabon (the Ruabon Coal &  
Coke Co., Ltd.), announces that Mr. Robert H. Johnson has  
been appointed London agent for the brick and terra-cotta  
department of the business, which will be carried on as here-  
tofore at the London office, 17 Wharf, South Wharf Road,  
Paddington, W

THE new schools, Lofthouse, near Wakefield, are being  
warmed and ventilated by means of Shorland's patent Man-  
chester grates, patent exhaust roof ventilators and special inlet  
panels.

MR. TOM JONES, late with Mr. James Gibbons, of Wolver-  
hampton, has commenced business on his own account as a  
manufacturer of locks, panic bolts, door furniture, reversible  
windows, &c., at 47 Guilford Street, W.C, under the title of  
Tom Jones Lock and Company.

MESSRS. W. JAMES & Co., by acquiring adjoining premises,  
have been able to fit up complete showrooms, comprehensive  
of all kinds of ornamental glasswork, at their works, Willes-  
Road, Kentish Town, N.W. The advantage of this is obvious,  
their patrons being able, in addition to choosing designs for  
stained glass, &c., to select the various tints, glasses, &c., to be  
used from the actual stock, which is of a very extensive and  
varied character, and also to see the work in progress.

THE Birkbeck Building Society has attained its Jubilee, having been established in 1851, and its directors may well be congratulated on their fiftieth annual report which has just been issued, which sets forth that the receipts from shareholders on completed and uncompleted shares during the last twelve months amount to 294,150*l.* 2*s.* 9*d.*, and the amount repaid 277,496*l.* 10*s.* 1*d.*, showing a balance now due to investors of 963,912*l.* 4*s.* 3*d.*, being a net increase on the year of 16,653*l.* 12*s.* 8*d.* The deposits received during the year amount to 13,938,904*l.* 7*s.* 4*d.*, and the sum repaid is 13,924,573*l.* 12*s.* 7*d.*, leaving a balance now due to depositors of 9,015,439*l.* 12*s.* 3*d.*, being an increase on the year of 14,330*l.* 14*s.* 9*d.* After writing off all realised losses, there remains a clear surplus profit of 25,459*l.* 10*s.* 1*d.* for the year, as shown in the balance-sheet, thus increasing the permanent guarantee and temporary reserve funds to 513,222*l.* 17*s.* 5*d.* being the largest sum ever reached—amounting on an average to over 10,000*l.* per year for each of the fifty years of the Society's existence.

### NEW CATALOGUE.

MESSRS. MATHER & PLATT, of Salford Iron Works, Manchester, have sent us a copy of a very elegantly prepared catalogue of the exhibits which they have installed at the Glasgow Exhibition. It is exquisitely printed in sepia on paper of a luxurious quality, the text being profusely interspersed with artistic illustrations in black, depicting the various machines manufactured by the firm, comprising locomotives, condensers, filters, water and sewage purifying apparatus, water-softening plant, pumping machinery, fire appliances, strong-room doors, printing machines, and many other useful and interesting machines and appliances.

### SOUTH FORELAND ESTATE, ST. MARGARET'S BAY.

THIS is situate about two miles south-east from Martin Mill station, on the Dover and Deal section of the South-Eastern and L. C. & D. railways, and four miles north-east from Dover. The church of St. Margaret-at-Cliffe, near to, is a fine specimen of Norman architecture, and the massive tower contains a clock and one bell. The curfew, it may be mentioned, is still rung here during the winter.

### ILLUSTRATIONS.

CATHEDRAL SERIES.—CHICHESTER: THE SCREEN AND CHOIR.

THE NEW CHILDREN'S HOMES AT SIDCUP, KENT, FOR THE GREENWICH GUARDIANS.

FERRING GRANGE, WORTHING.

PORCH AT HALIFAX.

TOURELLE, HALIFAX.

St Margaret's Bay is a picturesque, sheltered inlet, which seems likely to become at no distant period quite a fashionable watering-place.

The guillemots breed in the cliffs in great numbers, and the finest-flavoured lobsters in England are said to be found in the locality. A small pier was constructed below the cliffs, by the order of Archbishop Morton, for the defence of the fishing craft.

The two lighthouses on the South Foreland are but a short distance apart, and this is the nearest point to the French coast. The light at Dunkirk is here visible, as well as those at Calais and Boulogne. The view from the cliffs is magnificent, and is rendered more than usually interesting from the large number of vessels of all kinds that are constantly passing to and fro. The estate referred to occupies a grand position extending up to the verge of the cliffs, and rises to about 350 feet above sea level, while the climate is of a remarkably bracing and salubrious character.

On Tuesday last Messrs. G. Wheatley & Son, of Chancery Lane, offered for sale, after the usual pleasant preliminaries, in a marquee on the property, sixty-eight plots of eligible freehold building land, some of which passed hands at fairly good prices, varying according to size and position, while others were withdrawn in order, we understand, that they might subsequently be dealt with by private treaty.

### VARIETIES.

THE United Methodist Free church at Lowerplace, Rochdale, has been reopened after alterations which have cost 320*l.*

THE new Presbyterian church erected at Chollerton, North Tynedale, was opened for divine worship on Saturday afternoon.

A NEW drill hall which has been erected at a cost of 600*l.* at Stroud, for the accommodation of the C company of the 2nd Volunteer Battalion Gloucester Regiment, was opened on the 5th inst.

MR. W. VAUGHAN, architect, Bradford, has been appointed permanent architect to the Bradford School Board. Mr. Vaughan has been chief architectural assistant to the Bradford Corporation for the past nineteen years. The new position is worth 300*l.* per annum, and Mr. Vaughan will be allowed to take two pupils.

A JOURNEYMAN painter named William King, working at Barrow-in-Furness, has received intimation from a firm of London solicitors that owing to the death of an uncle in Australia he has become heir to 125,000*l.*, and requesting him to proceed to London at once. King left Barrow, and will probably proceed to Australia. There is said to be also considerable landed property.

THE Northern Architectural Association (England) paid a visit to Edinburgh on Saturday. The company included Mr. Caws (president), Mr. Taylor (vice-president) and Mr. Plimmer (secretary). They were received and entertained to luncheon by the Council of the Edinburgh Architectural Association, and afterwards visited St. Mary's Cathedral, St. Giles's Cathedral, the Parliament Hall, the Royal Exchange, George Heriot's Hospital and the McEwan Hall, under the leadership of Mr. Henry F. Kerr, president of the Edinburgh Architectural Association.

AT the examination in carpentry and joinery held at Carpenters' Hall, London Wall, on the 3rd inst., the following candidates were successful:—*First Class.*—(1) Jas. Sandham (silver medal); (2) H. T. Barnes (bronze medal). Frank Turner, W. J. Stone, G. W. Filby, F. E. Glover. *Second Class.*—H. O. Armstrong, H. Searle, W. G. Pack, E. C. Durnford, F. H. Sharp, H. E. Pack, W. R. Peirce, Wm. Court, R. Pierson; C. F. Parsons, F. W. Spring, W. G. Brooks, and W. H. Gardner. The candidates came from various parts of the country—Lancashire, Yorkshire, Berkshire, &c. The examiners were Prof. Roger Smith (Master of the Company), Mr. Jno Slater, V.P., R.I.B.A., Sir Philip Magnus, Mr. Seth-Smith, P.A.A., and Mr. Jas. Bartlett (examiner, &c., to the Society of Architects).

THE reopening will take place this (Friday) evening of St. Saviour's Church, Falkner Square, Liverpool, which was destroyed by fire on February 4, 1900. The cost of rebuilding

the church was estimated at about 10,000*l.*, towards which 4,730*l.* was provided by the Ecclesiastical Buildings Fire Insurance Company, and subscriptions have been received amounting to 4,317*l.* The estimate included the reconstruction of the building, the transference of the chancel from the west to the east end, involving structural alterations, the erection of new entrance-porches, the reseating and furnishing of the interior, the provision of a new heating and ventilating apparatus, the substitution of electric light for gas, a new organ and the conversion of the cellars beneath the church into a parish room (capable of seating about 300) and smaller rooms suitable for classes and a club-room for young men.

### BUILDING AND BUILDERS.

THE present day schools at Tonbridge having become inadequate, new buildings are being erected at a cost of 1,075*l.*

A SITE has been secured for a new chapel close to the North-Eastern Railway works at Holgate, York.

PLANS have been passed for a new police-station at Chapeltown, Leeds.

MEMORIAL-STONES have been laid of a new church at Morthoe, near Ilfracombe. The building will seat 250 and will cost 1,500*l.*

THE foundation-stone of new goods offices and accessories at Eye station were laid on the 3rd inst. Other alterations and improvements will soon be effected at the station, these things being necessitated by the steady increase of business.

A NEW church and schools, to supersede the existing school chapel, is to be built at Newport, Mon. The cost will be 7,000*l.* The church will accommodate 600, and the school about the same number.

THE Boston Town Council have decided to apply to the Local Government Board for sanction to a loan of 20,000*l.* for the provision of new municipal offices and police-courts for the borough. The new rifle butts have been completed.

THE Dalkeith Burgh School Board have accepted estimates for the erection of the new public school in the Crofts, Dalkeith. The estimated cost, including the price paid for the site, is 11,967*l.*

THE buildings of Mansfield College, Oxford, are to be completed shortly by the erection of a lodge at the gateway. Sir W. H. Wills has offered the college council 1,000*l.* towards

the cost, and plans prepared some years ago by Mr. Basil Champneys are to be utilised.

THE memorial-stone will be laid on Thursday, the 18th instant, of the fire-station in course of erection at the junction of Horn Lane and Tunnel Avenue with Lower Woolwich Road, East Greenwich.

MEMORIAL-STONES have been laid of a new day school at Midsomer Norton, the Education Department having decided to give no more grants after this year for the present building. The new buildings will cost about 4,500*l.*, and accommodation will be provided for 486 children.

THE Local Government Board inquiry into the sea defence of Lowestoft brought out the interesting fact that since 1882 500 feet of foreshore have been engulfed, and about 20,000*l.* has been spent to retain the remainder. The present scheme will involve an outlay of 37,000*l.* for sea-wall and groynes.

THE Welton Rural District Council have received the report of Mr. J. R. Elliott, C.E., of Nottingham, upon a scheme to supply Bardney with water. A pumping station with filters and water tower is proposed, and a loan of 3,000*l.* will be required.

At the monthly meeting of the Hull Town Council Mr. Panton suggested that the plans for the new public hall should be thrown open for competition, but the Mayor said that they were desirous of keeping the expenses down, and their own architect would be fully equal to the task of supplying them.

THE preliminary steps have just been taken towards the building of the much-discussed cathedral at Liverpool. With a view to testing the adopted site at St. James's Mount for the foundation-laying, test-holes have been bored in different portions of the site.

THE foundation-stone has been laid of the new façade which is being erected at the Forres, N.B., Mechanics' Institute. The old front of the Institute had got so dilapidated that a new front was rendered necessary, and this is being carried out at a cost of 1,400*l.*

A MEETING of the congregation of Erskine U.F. church, Falkirk, has been held to consider a recommendation for a joint meeting of session and managers that a new church be built on a new site. The location of the present church is not at all suitable, while the building itself is not adapted to the requirements of a growing congregation. After some discussion it was decided by a considerable majority to adopt the recom-

mendation submitted, and a committee was appointed. The proposed church is expected to cost about 8,000*l.*

THE Corporation Bill for powers to build a new wide viaduct road to the railway stations and Admiralty pier at Dover has passed its second reading unopposed in the Commons. This improvement is to cost about 100,000*l.*, and is an adjunct to the great scheme of harbour enlargement and amelioration now proceeding.

THE West Ham Town Council have decided to spend 60,000*l.* in the erection of public bath-houses for Stratford, and a site has been secured in Romford Road. The baths will be built in elaborate fashion, and will rank among the finest in the kingdom. The large swimming-bath, which will be 100 feet by 35 feet, will have a gallery round it, capable of accommodating 500 persons, and the dressing-boxes will be constructed so as to fold back against the wall, providing space for an additional 500 spectators. Provision will be made for flooring over the bath in the winter, so that it may be used as a gymnasium or entertainment hall. There will be several slipper baths with waiting-rooms, as well as a Turkish bath.

At the Salford Town Hall on Tuesday Colonel A. G. Durnford, R.E., held an inquiry on behalf of the Local Government Board into the application of the Salford Corporation for permission to borrow 5,000*l.* for sanitary purposes, 1,200*l.* for the erection of bandstands in Peel, Seedley, Albert and Ordsal Parks, and 11,500*l.* for the rebuilding of Broughton Bridge. Mr. Greenhalgh, of the Town Clerk's Department, made the application for the Corporation, and in reply to the Inspector, said that the assessable value of the borough was 925,222*l.*, and the outstanding loans under the Public Health and Sanitary Acts 57,316*l.* Evidence having been given by Dr. Tattersall, medical officer, Mr. J. Corbett, borough engineer, Mr. Charles S. Allott, bridges engineer, and Councillor Williams, the inquiry closed.

### GRAND HOTEL, SOUTHWOLD.

THE Coast Development Company, which is perhaps best known in connection with its excellent fleet of "Belle" steamers, abundantly justifies its name by the enterprising manner in which it is revivifying or improving the watering-places on the east coast. Its latest effort in this direction has resulted in the provision of a new, high-class and thoroughly up-to-date hotel, "The Grand," at Southwold, which was inaugurated by a very pleasant luncheon on Tuesday last.

The hotel, erected from designs by Mr. Chas. H. M. Mileham, of Lincoln's Inn Fields, consists of a main block nearly 150 feet in length and of six storeys in height, with an annexe two storeys high, extending nearly the whole length of the building. The ground-floor storey and the lower ground-floor are faced externally with red brick; the two storeys above are coated with rough-cast of a warm cream colour, and the next storey and the roofs above are covered with red tiling, the several fronts being further diversified by turrets, bay windows and verandahs, which, together with the stone porches, windows and cornices, and the green jalousies and ironwork, give an agreeable variety of colour and outline to the whole. The main block, facing the sea, contains the principal public rooms, the lounge, dining-room, reading-room and drawing-room, and the visitors' rooms. In the western annexe is the principal entrance for the reception of visitors, with the vestibule, office and manager's room, smoking and billiard-rooms, and also the kitchen and culinary offices, &c. The visitors' rooms, some of which have bay windows and verandahs, are mostly on the first, second and third floors, and nearly all face the sea. Running right and left from the principal stairs and lift on each of the upper floors are corridors, in which are secondary staircases, the whole height of the building. The interior is lighted throughout by electric light. The lounge is a spacious apartment on the ground floor and in the centre of the building, approached by the vestibule on one side and by the eastern porch on the other, and from it all parts of the interior are directly accessible by corridors, stairs and lift. The dining-room is about 50 feet in length and 34 in width. Three columns support its ceiling and the superstructure above. Along the sea frontage of this apartment are four bay windows, spanned by the arches of a continuous arcade, while the service is conveniently administered from the opposite side of the room. The reading-room is a smaller apartment, similarly arranged, with arched bays. The smoking-room is entered from the inner lobby of the western porch, and is served by a hatch from the bar, which is placed between it and the dining-room. The billiard-room is lighted by a top light as well as by side windows. It has a half-domed recess at one end, and platforms in the usual way for spectators of the game. It is approached through lobbies, both from the vestibule and the lounge, which also give convenient access to the lavatories on the ground floor. The drawing-room, with its panelled walls and ceiling and its arched bays, is on the first floor, approached by the lift or the principal stairs, on the half-way landing of which is a cosy

recess, with seats, &c. The stair brings the visitor opposite the door near one end of the drawing-room, while the corresponding door near the other end opens into an ante-room leading to an asphalted terrace or flat roof, overlooking the west garden and tennis-courts and the country beyond. This flat roof—called the battlements—makes a delightful open-air lounge, and will probably be a favourite spot for afternoon tea. There is a complete system of heating the public rooms, staircases and corridors by radiators in order to fit the hotel for residence in the winter. Though quite complete in itself the building is arranged for future extension by wings at the north and south ends.

### THE WARRINGTON CORPORATION WATERWORKS.\*

IN 1846 powers were obtained from Parliament by the waterworks company, and in the following year the Appleton reservoir in Cheshire was constructed, the engineer being the late J. F. Bateman. The drainage area was 540 acres, and the reservoir, together with two residuum lodges, had a capacity of 50 million gallons; two filter-beds, with an aggregate sand area of 1,300 square yards, were also constructed, and a clear-water tank holding 350,000 gallons, from which the water was taken to the town. The level of top water in the storage reservoir was 133.81 feet, and that in the clear-water tank 114.95 feet above Ordnance datum.

In 1858, upon the advice of the late Mr. J. F. Bateman, the level of Appleton reservoir was raised 3 feet, giving a capacity of 60 million gallons, and a water area of 20½ acres. A 24-inch culvert was also laid, conveying the waters of the Hatton and Daresbury brooks, having a watershed of 820 acres, to the reservoir, the available flow being, however, limited to the discharging capacity of the culvert. No extensions have been carried out at Appleton since the above date. No compensation water is given from this reservoir, nor is the undertaking limited in any way in regard to the appropriation or diversion of any springs or streams.

In 1868 further extensions being necessary, the directors called in the late Mr. Thomas Duncan, at that time water engineer to the city of Liverpool, who advised the sinking of

\* A paper read by Mr. James Deas, Assoc. M. Inst. C. E., engineer, at the meeting of the Association of Waterworks Engineers.

wells at Winwick, in Lancashire. These works were carried out by Mr. C. H. Beloe, M.Inst.C.E., of Liverpool, and consisted of the following:—Two wells were sunk to a depth of 150 feet (or 40 feet below Ordnance datum) in the new red sandstone, one within the engine-house and the other immediately outside it. At a depth of 50 feet from the surface a large chamber was excavated in the sandstone, which throws the two wells into one from this depth to the bottom. From the bottom an unlined borehole 18 inches in diameter was carried down to 212 feet below it, or 252 feet below Ordnance datum, but was afterwards plugged on account of the bad quality of the water. An engine and boiler-house, service reservoir, cooling pond and two cottages were also erected. The machinery comprised a single-cylinder beam engine, having a normal speed of 10 strokes per minute, cylinder 30 inches in diameter and stroke of 6 feet; two single-acting pumps 18 inches in diameter and 4-foot stroke, one of them situated in the engine-house well and the other in the well outside; a small horizontal engine alongside the engine-house acts as a stand-by for the outside pump. The engines were erected by Messrs. Yates & Thom, of Blackburn, in 1871. There were also put down three Cornish boilers, 6 feet in diameter and 25 feet long, working at 40 lbs. pressure. A jet condenser and a small cooling pond were also provided. The service reservoir is rectangular in shape and is built of brick and concrete, having a capacity of  $2\frac{1}{4}$  million gallons. The tops of the covering arches were so formed as to contain about 9 inches of water, for the purpose of keeping the water inside the reservoir cool. The top-water level in the reservoir is 131 feet above Ordnance datum.

As soon as the Winwick works were available the use of the Appleton water for domestic purposes was discontinued.

In 1878 further works were necessary on account of the rapid growth of the town and district, and Mr. Alfred Moore, M.Inst.C.E., of Manchester, who was then consulted, advised a great number of works, only one of which was carried out, viz. extensions at Winwick as follows. A new engine-house was built, containing two single-cylinder beam engines, by Messrs. Daglish, of St. Helens; cylinders 21 inches diameter, stroke 6 feet, each engine driving a single-acting pump, 17 inches diameter and 3 feet stroke, fixed in a well under the house at 15 strokes a minute; a third well was sunk 80 feet from the other two, and connected by a tunnel in the rock; a tunnel was also driven in a south-easterly direction for a distance of 1,200 yards, the work being carried on from four shafts. The

level of the invert of this tunnel is 38 feet below Ordnance datum. The engines are capable of lifting  $2\frac{1}{2}$  million gallons per day of 24 hours. This was the last extension carried out previously to the passing of the Waterworks Purchase Act in 1890, under which the Corporation acquired the undertaking from the company in the same year at the price of 278,000*l*.

The Appleton and Daresbury watersheds consist of well-cultivated lands, carrying a considerable population, and when the works at Winwick were constructed in 1868 all domestic consumers were changed over from one system to the other, and the Appleton water was thereafter used solely for trade and sanitary purposes, involving practically a duplicate system of mains through the town. Winwick water is also used for trade purposes in some cases, but if possible, and if the water is suitable for the industry, that from Appleton is used exclusively for such purposes.

The district of supply is a fairly large one, embracing an area of over 40,000 acres, and the populations actually supplied were, in 1861, 34,105; in 1871, 40,837; in 1881, 53,608; in 1891, 68,748; and in 1901, estimated at 80,000.

From Winwick there are pumped annually about 550 million gallons, of which amount 90 millions are used for trade purposes and the remaining 460 million gallons for domestic purposes. From Appleton there are supplied 130 million gallons, giving a domestic consumption of 460 million gallons and a trade consumption of 220 million gallons per annum.

In 1898 the demands necessitated additional supplies both for domestic and trade purposes, and the Corporation instructed the author to prepare the necessary plans, &c., and Mr. James Mansergh (now president of the Institution of Civil Engineers) was also called in to assist the Corporation in getting their Bill through Parliament. Powers were obtained in this Act for the various works described below, which are being constructed from the designs and under the superintendence of the author, at an estimated total cost of 247,000*l*.

The new works for the domestic supply comprise an entirely new pumping-station at Delph Lane, about  $1\frac{1}{2}$  mile east of Winwick, with a pump well 12 feet 6 inches diameter and 160 feet deep, at the bottom of which an adit 6 feet high by 4 feet wide is being driven in a north-easterly direction for a distance of about 1,200 yards, there being three working shafts in addition to the pump well. The contract for the well and heading complete is let to Mr. George Lawson, of Rutherglen, at 24,400*l*. The buildings will comprise an engine-house 50 feet by 35 feet, boiler-house 50 feet by 19 feet, coal-shed

# NO HOUSE, OFFICE, or FACTORY SHOULD BE WITHOUT A RELIABLE & GERM-PROOF FILTER.

**Dr. ANDREW WILSON writes as follows:—**"The filters sold by the Berkefeld Filter Co., Limited, London, W., remove all germs from water. They therefore represent ideal filters, giving pure (*i.e.* germless) water, and thus prevent typhoid fever and many other diseases."

## SIMPLE IN CONSTRUCTION, MOST EASILY CLEANED.

121 OXFORD STREET, LONDON, W.

50 feet by 19 feet, workshop and store 50 feet by 15 feet; houses for the engine-driver and stoker will also be provided.

The water from the new well will be lifted by means of a triple-expansion vertical receiver engine actuating two deep-well pumps 18 inches diameter and 3 feet 6 inches stroke to a cast-iron tank under the engine-room floor, and thence the water will be delivered by means of force-pumps through  $1\frac{1}{2}$  miles of 20-inch cast-iron rising main to the Winwick reservoirs. It is intended at some future time to duplicate the whole of the machinery, the buildings being made large enough to allow of this being done. The high, intermediate and low pressure cylinders will have diameters of 13 inches,  $22\frac{1}{2}$  inches and 35 inches respectively, and steam will be supplied at a pressure of 160 lbs. per square inch from two Lancashire boilers 18 feet long by 7 feet diameter, having Simpson's superheaters and Green's economiser attached. The engines and pumps are to be capable, when running at their normal speed, of raising 3 million gallons of water per 24 hours against a head of 250 feet, and the duty guarantees are as follows:—13.9 lbs. of steam and 1.5 lb. of Welsh steam coal per pump horse-power hour.

The plant is being supplied by Messrs. J. Simpson & Co., London, the contract price being 11,175*l*.

The rising main is being laid by Messrs. Jowett Bros., of Burscough, at a contract price of 1,940*l*., the pipes and specials being supplied by the Staveley Coal and Iron Company at a contract price of 4,330*l*.

At Winwick the service reservoir accommodation is being increased by a new reservoir 215 feet by 190 feet, and 20 feet depth of water; its capacity is  $4\frac{1}{2}$  million gallons, and top-water level 131.35 feet above Ordnance datum. It is entirely of concrete, the roof being formed of concrete arches supported on eleven cross-walls. The floor and main walls are lined with Callender's bitumen sheeting, with a facing of  $4\frac{1}{2}$  inches of blue wire-cut Ruabon brick, and the roof is laid with bitumen sheeting to prevent infiltration of surface water. The new reservoir is provided with the usual inlet, outlet, scour and overflow pipes, also connections to the existing reservoir. The contract for the reservoir, together with boundary walls, roads, &c., is let to Mr. George Bell, of Manchester, at 22,000*l*. A 27-inch Venturi meter will be fixed on the service main leading to the town, so that the rate of consumption may be continuously recorded.

An entirely new service is being put down for the higher parts of the district of supply, and a pair of Worthington pumps

are being fixed in a new engine-house close to the Winwick service reservoirs for this purpose. The engine-house, which is being built by Messrs. R. W. Collin, of Warrington, at a price of 1,785*l*., has a committee-room and other necessary offices attached. A new boiler-house and coal-store has also been built, the former being provided with two Lancashire boilers, 30 feet long by 8 feet diameter, for supplying steam to the new Worthington pumps at 150 lbs. per square inch, which pressure will be reduced to 40 lbs. for the supply to the old engines. The engines are of the Worthington triple-expansion type, having high-pressure steam-cylinders 8 inches in diameter, intermediate steam-cylinders 12 inches in diameter, two low-pressure steam-cylinders 20 inches in diameter, double-acting plungers 7 inches in diameter, all having a uniform stroke of 15 inches, each engine being capable, when running at a normal speed, of raising half a million gallons per day of twenty-four hours, through six miles of 10-inch and 8-inch diameter rising main, the water being drawn direct from the service reservoirs into a suction stand-pipe in the engine-house.

The engines are being constructed by Messrs. J. Simpson & Co., at a contract price of 2,954*l*., and the duty guarantees are as follows:—25 lbs. of steam and 3 lbs. of coal per pump horse-power hour. These engines deliver into a new high-level service reservoir at High Warren, which is circular in plan, 126 feet diameter at top-water level, depth 16 feet, and capacity  $1\frac{1}{4}$  million gallons. The top-water level is 340 feet above Ordnance datum. The floor, walls and roof are of concrete, the roof being supported upon cast-iron columns, carrying rolled steel joists and arched steel channels and expanded metal sheeting; a dwarf wall runs across the reservoir so that one half can be used for supplying the district while the other half is being cleaned out. Callender's bitumen sheeting is used for the walls and floor, and also for covering the roof. The contract for this reservoir has been let to Mr. C. W. Davenport, of Warrington, at 6,748*l*.

The rising main to this reservoir, and the service pipes to the town therefrom, have been supplied by the Stanton Iron-works Company, at a cost of 6,700*l*., and laid by the Corporation workmen. Where the main passes under the Manchester Ship Canal (in subway) it is formed of lap-welded steel pipes 10 inches diameter, tested to 500 lbs. per square inch *in situ*, supplied by Messrs. T. Piggot & Co., of Birmingham, at 515*l*. All cast-iron pipes throughout the works have solid lead joints, no yarn being used, and in the case of pipes 18 inches and upwards in diameter the whole of the joint is poured.

The valves and similar apparatus throughout the works are being supplied by Messrs. Glenfield & Kennedy, of Kilmarnock, at a cost of 700*l*. There will also be a complete system of electrical level transmitters, indicators, and recorders for the reservoirs and wells, the instruments being manufactured by Mr. George Kent, of London, and the connections, &c., being executed by the Warrington Electric Light and Power Company.

The new works for the trade supply consist of a storage reservoir of a capacity of 170 million gallons on the Daresbury brook, utilising a watershed of 940 acres. This will be formed by an earthen embankment 800 yards long and 65 feet maximum height. There will be the usual tunnel outlet and a line of pipes conveying the water to the existing filters at Appleton. The estimate for this reservoir is 100,000*l*., and the general surveys have been made and negotiations for the land are in progress. At Appleton two new filters and a service reservoir will be constructed, and the existing filters will be reconstructed. Workmen's cottages will also be built. It is hoped that these works will be commenced in the autumn of this year (1901).

### THE "NEW ART" AT SOUTH KENSINGTON.

A PARAGRAPH has been going the round of the papers, writes Mr. Lewis F. Day in the *Manchester Guardian*, announcing the gift to the Victoria and Albert Museum of a collection of "new art" furniture, now to be seen in what was lately the tapestry court at South Kensington, but apparently no one has questioned the propriety of accepting such a gift. I venture to do so. There may be a certain savour of ungraciousness in looking closely into the value of a gift, offered no doubt with the most generous intentions, but the interests of art and education are not served by the rash acceptance on behalf of the nation of whatsoever it may seem good to a would-be donor to bestow upon it. If the museum is to fulfil its purpose there must obviously be not only surveillance, but very strict surveillance over whatever is admitted into it. A great responsibility rests with someone, with whom precisely it is not given to us to know—probably with the President of the Board of Education, possibly with some of my own good friends. The policy of admitting into the national collection the work of living artists, and especially of producers actively engaged in trade, is at the best doubtful. The abuses to which it might

lead are so patent that in years past admission has been most jealously guarded. Perhaps, as events prove, it has not been an unmixed evil that the "funds of allocation," to quote the paragraph, were not sufficient to permit of relaxation in severity. There may or may not be need for a museum "where the manufacturers and artisans of this country might see what other nations are striving for in the direction of original design not based upon past productions," though that is not the end to which South Kensington Museum was established, but rather to preserve for our instruction and enlightenment the best that has been done. Old work was not always good, but the conditions under which it was done were more favourable to art than are the conditions of modern trade; time has sifted it, and, as a consequence, the national collection is composed, and must be composed, largely of old work, all the more valuable because it is not what is being done nowadays, because it holds up an ideal of art and workmanship which competitive trade has done much to degrade. In any case the purpose of the Victoria and Albert Museum is (or else there is a very general mistake on this point) educational. Is it not under the control of the Board of Education? And the Board has appointed, as we know, a Council of Artists to advise them. Why not, then, consult them on a question of this importance? It is not for a moment to be supposed that artists like Mr. Walter Crane, Mr. Onslow Ford, Mr. Graham Jackson and Sir William Richmond are responsible for admitting into the very best of society these ill-mannered specimens of upstart art, of giving them, indeed, a place of conspicuous honour there, and, by implication at least, recommending them to the attention of the student whose taste is yet to be formed. As though he were not too prone already to follow a new fashion, whatever it be, and to look with youthful disdain upon the masterwork of the past, from which he has all to learn, and learns so little, because he so little appreciates it.

We have heard during the last few years too much about the "new art." It has long been the catchword of enterprising tradesmen. Is it now seriously to be accepted by the wardens of artistic education? Do they know no better than to confound originality with novelty? Are they not aware that what is good in this "new art" is not new, and that what is new is not good? Grant that there may be promise in its unrest, the very readiness of the new generation to go with it argues natural sympathy between the two, and the needlessness therefore of encouraging the restive to kick over the traces. Those of them who may have been held in till now by a doubt

# THE CUNDALL PATENT OIL ENGINE

## COPY OF LETTER.

THE GREAT WESTERN HOTEL,  
OBAN: October 29, 1900.

DEAR SIRS,—I have very great pleasure in testifying to the efficiency of the 20 B.H.P. Oil Engine which you supplied for driving the Dynamo, which gives current of equal H.P. for lighting and Motors in the Hotel. The Engine has now been in use almost daily for over three months, without the slightest hitch. It gives the utmost satisfaction and the most favourable results.

Practical men who have seen the Engine working pronounce it to be the best and smoothest working they have seen.

What I think is one of the features of your Engine is that my man can start it without any assistance. Most Oil Engines I have seen were difficult to start, taking three, four, and sometimes six men to start them.—I am, yours faithfully,

ALEX. MCGREGOR.

# R. CUNDALL & SONS, LTD. SHIPLEY, YORKS.

London Office—20 & 22 St. Bride Street, E.C.

Paris Office—5 Rue Gozlin.

as to the wisdom of breaking loose from any restraint which the influence of the museum was calculated to impose upon youthful recklessness will doubt no longer. Have they not now authority for giving reins to the wildest that is in them? And it seems the project is presently to circulate this unfortunate collection and send it round in succession to various manufacturing towns. Alas that the Circulation Department should lend itself to such service, to the greatest demoralisation of the greatest number.

The collection is, it might be contended, an object lesson. To pass from this "new art" furniture into the neighbouring court, where stand the noble specimens of Renaissance cabinet-work temporarily deposited in its favour, is to emerge from nightmare into repose. How dignified are the old *cassoni*, cabinets and tables, even when the carving on them is exuberant. But that is not the impression the contrast is likely to produce upon the student inflamed by "up-to-date" extravagance and not yet arrived at appreciation of what is finest in design. He will see in it, and it appears as if he were meant to see in it, no warning, but encouragement, incitement to do what he had better leave undone. He will not ask himself how far the new artists have succeeded; enough for him that they have dared—that will naturally win his sympathy and admiration, and there is no denying their daring; they have always the courage to go astray, not apparently realising the danger in so doing.

It is not meant to say or to imply that the disciples of "the new" have not done good work in furniture. There are in the cases in the centre of the room specimens of French, Danish and American work in glass, pottery and metal (not apparently part of the gift, and chosen with much better judgment), which represent departures in technique, if not always in taste, of which it behoves the British craftsman to take note, and the furniture itself is often distinctly interesting, but it is almost invariably marred by extravagance. M. Gallé, for example, is seen to much greater advantage in his cleverly manipulated glass than in his furniture. What was merely fantastic in glass-blowing strikes one as quite frivolous in cabinet-work. M. Gallé is an artist of imagination, but the charm of his work is purely personal. Never was genius more likely to lead his followers astray. It is the fashion to extol the taste of the French; they have, indeed, a certain knack of artistry lacking in Englishmen; but of controlling taste, judgment or reticence little enough, as a glance round the new room at South Kensington will show.

The theory, tenable in itself, that artists in the making should not be influenced in their studies by authority, is hardly one that an educationist can hold; carried to its logical conclusion, it would result in leaving the student without education. It is the plain business of a Board of Education to have a very definite opinion as to what is calculated to advance learning, and to have the courage of its opinion. It has always been a mystery, for example (in so far as it is not explained by cowardice or conscious incompetence), why in a museum the labels attached to various objects do not always tell us what is remarkable in them and why they are there, instead of describing, as they often do, only what everyone can see with his own eyes; but so long as no word of warning is vouchsafed against art unworthy of emulation, the authorities should hesitate to expose it in an educational museum. The point at which to draw the line may be open to dispute, but it will hardly be disputed that it should be drawn at the confines, if not of sobriety, of sanity at least.

The cause of quarrel with this "new art" is not that it is new, but that it is not sober or sane enough to be endorsed by the educational authorities. Who would wish to sleep in such a bed, to face such a settle, to sit in such chairs as are assembled in what was the tapestry-room at South Kensington? Who would care to contemplate such a tapestry as is there shown? The name of M. Grasset is no excuse for such a tame and tawdry production. Think of what Burne-Jones and Morris have together done in this country and then of this childish performance set up for admiration. And the picture is by no means an exceptional instance of poor colour; it is of a piece with other thin and crude French tinting, and no more worthy of reproduction in the loom than the posters of the same and other artists on the walls, themselves, it must be said, strangely out of place in a permanent national museum. That they go well enough with the furniture does not say much for that. So does the frieze above, stencilled by Mr. T. T. Blaylock. And the fact that he is equal to the occasion goes to prove, were proof needed, how little our art students have to learn from design of this kind, long since only too familiar to them in the pages of every illustrated periodical which has to do with decorative art. Indeed, this "new art" of the French and others is but a foreign version of our own English extravagance carried to yet further excess. It is the delirious art of men raving to do something new, oblivious in their rage alike of use and beauty. It is precisely the last thing it was desirable to set before the student, calculated as it is to counteract the good

## THE UNION PLATE GLASS CO., LTD., POCKET NOOK, ST. HELENS

Telegrams, "Union, St. Helens." Nat. Tel. 48.

ESTABLISHED 1837.

Interior Lighted by ordinary Plate Glass.

Makers of Ground, Smoothed, Polished, Silvered, Bevelled, Brilliant Cut, and Bent Plate Glass; Rough Rolled and Rough Cast Plate Glass; also of Rough and Polished Prismatic Glass, &c., &c.

### SPECIALITÉ: "REFRAX" (Protected under Patent Acts).

Extracts from Testimonials received:

"The 'Refrax' Glass is a GREAT IMPROVEMENT."

"Gives EVERY SATISFACTION."

"The Glass I am perfectly satisfied with; GREAT SUCCESS."

"Compared with Polished Plate Glass 'Refrax' gives TWICE AS MUCH LIGHT for EQUAL COST."

effect of the museum upon his taste. Whatever the munificence of the donor, it ought never to have been accepted and ought not to be sent on circulation.

### ELECTRIC LIGHTING AT YORK.

A RECORD report has been presented to the electric-lighting committee of the York Corporation by Mr. C. A. Midgley, the city electrical engineer. In it he states that, after payment of all outgoings, including interest and sinking fund, and also discharging the debt of 310*l.* 19*s.* 6*d.*, incurred in preliminary expenses, there is left a net profit of 98*l.* 15*s.* 9*d.* The year has been a phenomenal one, and has created a record which has never been equalled by any provincial station in its first year. Speaking of the capacity of the plant in the station Mr. Midgley says:—Professor Kennedy installed four engines and dynamos with a total horse-power of 320. With this plant we were in a position to supply 6,000 lamps of eight candle-power, each burning simultaneously. So great was the demand, however, that a 400 horse-power engine and dynamo was installed for the past winter. This No. 5 set is itself capable of supplying 7,000 eight candle-power lamps, but even with this set we have not been able to have one of the others laid off, and at the end of the year (March 31, 1901) we had a total lamp connection of 16,400 eight candle-power lamps connected to the mains, and we have over 5,000 eight candle-power lamps applied for, the majority of which will be connected by the end of July. . . . With reference to the mains, I beg to report that we have had practically no trouble with these during the past year; the mains, however, which were laid to Professor Kennedy's specification, are overloaded in all the streets, and will be quite unable to cope with the coming winter's demand. Professor Kennedy in his original scheme based his figures on a total lamp connection of 6,000 eight candle-power lamps, which he estimated would take about two years to reach; this figure was reached by the time we were ready to supply, and by the end of our first year we connected and were supplying current to 16,400 eight candle-power lamps. The report proceeds to specify the extra mains and extensions of mains required to meet the demand for the coming winter, and states that the total cost of these extensions, exclusive of excavations, jointing and materials, will amount to, approximately, 8,600*l.* In connection with the present extensions in the station, Mr.

Midgley finds that it will be necessary to alter the capacity of the battery to one four times as large as the present one, at an expenditure over and above the cost presented to the Local Government Board, of 2,000*l.*, exclusive of necessary extension of buildings. The estimated cost of the battery and building is 2,250*l.*, making a total expenditure on mains and extensions for the coming winter of 10,850*l.* Mr. Midgley concludes with the opinion that all the works are absolutely essential if the present rate of progress is to be maintained, and says that the applications for the light are already so extensive that the expenditure cannot but be remunerative. The committee, it may be added, propose to carry out the extensions of the mains, and also to alter the capacity of the battery as mentioned in the city electrical engineer's report, and for that purpose to enter into the necessary contracts. It is also proposed to make an application to the Local Government Board for their sanction to borrow the above-mentioned sum of 10,850*l.*

### ELECTRICITY IN GLASGOW.

At the sixth annual meeting of the Incorporated Municipal Electrical Association Mr. W. A. Chamen, C.E., presided. In the course of his opening address he congratulated the Association on the further large increase of membership from seventy-seven committee members at last convention to ninety-nine, and from 142 engineer members of all classes to 165 at the present time. Their present total membership was thus 264, or an addition of fifty-five since last convention. He stated that the number of units of electricity sold in Glasgow during the year ended May 31 was roughly 6½ millions. By issuing a sliding scale of charge the cost of production worked out at about 3*l.* 18*d.* per unit, or perhaps less, and it was estimated that 9,000,000 units would be sold for next year at an average cost of production of 3*l.* 3*d.* per unit. The charges were 6*d.* for the first 365 hours' use per annum of the maximum demand and 1*d.* thereafter, with, however, uniform rates of 3½*d.* for domestic consumers, theatres and halls, 3*d.* for churches, and 1½*d.* for power. Many of the consumers, however, would be paying only about 2*d.* per unit for lighting under the sliding scale.

Baillie W. Maclay read a paper "On Street Lighting," in which he discussed the relative values of incandescent gas and electricity for street purposes. Whatever else electricity might have accomplished, there could be no doubt that since its

**PATENT "ACCESS" SYSTEM OF DRAINAGE.**

advent in 1880 there had been a steady and rapid improvement in the standard demanded for street illumination. There was nothing to show that for main thoroughfares where a really brilliant illumination was desired incandescent gas could in any way equal, far less surpass, electric light. A great deal had been made of the argument that electric lighting was "patchy," giving a brilliant illumination within a certain radius from the lamp and a comparatively poor illumination at points midway between, and great efforts had been made to show that by converting the ordinary flat-flame gas lamps into incandescent mantle lights the illumination was much more evenly distributed, although it might not be so intense at points near the lamps. This, however, had been investigated by electrical engineers, and it had been found that an equal standard of lighting, measuring the light at points midway between the lamp columns, could not be obtained in this manner, except by using such a number of incandescent gas mantles that the cost would be more than that of electric lighting to give the same result. So far it would seem that incandescent gas lighting in streets was not unlikely to have the same result as it had had in house lighting. It had been observed by those in a position to know best that the ordinary consumer of electric light went through three stages—first, ordinary gas; second, incandescent gas; and third, electric light; and for this reason electricity-supply authorities could not but welcome the improvement over ordinary gas which the gas mantle promised.

Bailie Mackenzie, Edinburgh, said he agreed with all that Bailie Maclay had told them except with regard to his criticism of their gas friends. He did not think it was conducive to pleasant working in municipal life that two departments should be at variance. He did not mind a healthy rivalry, but when they considered the enormous amount of public money that was sunk in gas undertakings they, as public men, could not do anything less than promote that industry as much as they could. While he wished the gas undertaking all success, he did all he could to further in a legitimate manner the interests of electric light. In Glasgow they had had large experience of electric light, and he understood that they were going ahead pretty fast. It was a question of money. If the community wished to bring in electric light and were prepared to pay for it three times the cost of gas they would get it. He thought he interpreted the opinions of municipal men in general when he said that the Corporation were prepared to pay the additional expense of having electric light in the main thoroughfares, but much as he wished the electric light to succeed, he would not,

as a municipal representative, be prepared to advocate so much lighting of side and unimportant streets. The cost of the lamps in Great Western Road was quite 500*l.* per mile per annum. With the introduction of the electric tramways this was quite necessary, but it could not be said that 500*l.* was a reasonable charge for small streets. Before the Corporation of Edinburgh took up lighting, a company composed of local people wanted to do the job for them. The Corporation, however, decided to keep electric lighting in their own hands. Many of the large shop and hotel keepers in Princes Street were members of this company, and, not having got the lighting, were a little ill-pleased, and they decided—at least they said so—not to have anything to do with electric lighting. They did not at first, but the Edinburgh Corporation set up fifteen lamps in Princes Street about 45 yards apart, and these illuminated the street so brilliantly that to go into a shop was like going into a coal-pit, and the shopkeepers were compelled in self-defence to put in electric light. The consequence was that every shop and hotel and club in Princes Street had this system introduced.

Alderman Pearson, Bristol, said he was substantially in accord with Bailie Maclay's views. His experience of the natural growth on this subject was that it began with an ordinary burner, and advanced to that of the mantle burner. When the mantle smashed at an inopportune moment, as mantles generally did, the user made a remark which was not reported as a rule, and then approached the electricity committee with a view to obtaining a supply.

Bailie Finlay, Glasgow, said he had no doubt that when people came to realise the advantages of electricity in their houses this light would hold the field. In Glasgow we had only a few hundred lamps. If we had a thousand lamps in our main thoroughfares it would lend a great impetus in the direction of cheapening the price to the people. He represented a ward in Glasgow with a population of about 150,000. The first line of electric tramways had been laid down on it, extending from Mitchell Street to Springburn, a distance of about two miles and a quarter. What had been the result? As a magistrate he found that the troubles caused by "corner boys" had diminished, and a certain kind of crime which he could not speak of more particularly had fallen very considerably. On the whole he thought they ought to be proud of trying to push their electric light on the public. In Glasgow the authorities did not apply profits from public undertakings in reduction of the rates. They held that the large consumer of electricity ought to get it at the lowest possible price.

# The Architect.

## THE WEEK.

LORD WEMYSS has gained a victory of which he must be proud, for the contest was over an architectural subject. On Tuesday he proposed in the House of Lords that models of the proposed Government Offices at Whitehall should be prepared and publicly exhibited. The Government opposed the motion on the ground that the expenses would amount to at least 600*l*. The Marquis of LANSDOWNE objected not only on account of the great inconvenience which would be caused by a delay, but also because it was doubtful whether a model always gave a perfectly clear impression of the effect which a building when erected would produce. Unless it were a model on a colossal scale, it would probably fail altogether to do so. It should also be borne in mind, he said, that unless the model included the whole neighbourhood it would give an inadequate impression of the appearance of the buildings when completed. Lord LANSDOWNE said he remembered citing, in regard to these particular buildings, the colossal edifices known as Whitehall Court, immediately to the rear of the site of the new War Office buildings, for the construction of which the Government were not responsible, and which had the effect of dwarfing any smaller buildings placed in their proximity. In spite of the anticipations of the noble Marquis, there was a majority of twenty-one in favour of the proposal. We need not inquire whether Lord WEMYSS was endeavouring to do something towards the realisation of INIGO JONES's great scheme, but for most people a model is more easily understood than any geometrical drawings, even when they are aided by perspectives. There is no doubt it was customary in SHAKESPEARE's time to submit models rather than drawings to building owners, and the practice gained the approval of Sir HENRY WOTTON, who was well acquainted with the procedure in Italy. The sum of 600*l*. will be only an insignificant addition to the expenditure, while it will enable the public to realise what is contemplated.

A FEW years ago it was decided by one of the metropolitan magistrates that a brick wall erected as a screen on each side of a shop should be demolished because a license from the County Council had not been obtained. With this precedent before him another police magistrate, Mr. D'EYNCOURT, might reasonably think himself justified to affirm that two buildings erected on a vacant piece of ground on one side of an old building, and which went beyond the general line of frontage, could not be regarded as an extension of the old building, and contravened the London Building Act. The magistrate declined to state a case for the opinion of the King's Bench Division. Counsel applied on Saturday for an order upon the magistrate to show cause why. Mr. Justice DARLING agreed with the magistrate, and thought the case was frivolous and comic, and in that opinion Mr. Justice PHILLIMORE concurred. When on Monday last application was made to the Court of Appeal the Master of the Rolls said a rule *nisi* should be granted. His lordship declined to say whether the points were frivolous or not. When the rule came on for argument it would be open to the other side to show that the points were frivolous.

THE proceedings of the Parliamentary committee appointed to consider the Bill by which powers are sought to sell and dispose of the site of Christ's Hospital in the City came to a conclusion on Tuesday last. Sir F. GODSON, the chairman, said that the committee found the preamble proved, subject to a right of pre-emption to the London County Council to acquire the whole or such portions of the site as might be agreed upon, the amount of land and price to be settled by arbitration on the basis of its value as building land. To avoid the loss that would be the result of undue delay where property of such great value was concerned, the award should be made within six months from the date of the Royal assent to the Act. On the suggestion of counsel the committee afterwards agreed to allow a four months' interval to enable the County Council to make their application, and three or four

months will be allowed for arbitration. The clerk to the London County Council, who was the last witness, said it would be a wicked thing if excavations were made and buildings erected regardless of any discoveries of objects of antiquarian and historical interest that might be made. The archaeological interest attaching to the cloisters and to the whole of WREN's buildings justified their preservation. The proposal to remove the stones to Horsham he treated as a ridiculous idea. Such objects of interest as were discovered should belong to the City Corporation or the Council. It was agreed that all objects of geological or antiquarian interest discovered shall, subject to the rights of the Crown, be deposited in the Guildhall Museum as the property of the Mayor and Aldermen and Commons of the City of London. Duplicates of one another or of objects already in the museum, or which it is not desired to preserve in the Guildhall Museum, shall be handed over to the London County Council to be preserved in such manner as the Council may resolve. As the Governors of the Hospital may now be said to have the desired authority to sell the ground, the difficult problem remains to settle how it may be disposed of. Many speculators would gladly pay a high price for the site to cover it with commercial buildings of various kinds, and that is likely to be the final arrangement. It is to be hoped that the part required for an enlargement of St. Bartholomew's Hospital will be reserved. To keep so valuable an area sacred because a few children were buried in the vaults does seem to be opposed to common sense, especially when so many churchyards in London have had to be utilised for modern buildings.

THE proposal to convert the hall of the Houses of Parliament, which was once adorned with frescoes, into a refreshment-room, must revive the history of a great failure. Some of the ablest painters who were then living entered with enthusiasm on the experiment of painting the walls, but the only surviving example of a large series illustrative of the poets is the *St. Cecilia* of Sir JOHN TENNIEL, that was inspired by the lines in DRYDEN's great ode. The artist at the time was known as a promising young painter. He had given no signs of the remarkable skill in representing political incidents with a dignity which heretofore was unknown in caricatures. It was probably owing to the simplicity of his methods and the thinness of the colour that his fresco did not succumb like its companions to the deadly power of the London atmosphere. It also has shown signs of decay, but, owing to the loving watchfulness of Professor CHURCH, the chemist, the painting is likely to endure for several years. The vanished pictures deserved a better fate.

WHAT can be done by a few earnest men for the preservation of antiquities against degradation or destruction has been exemplified at Rye. Some time ago the members of a local committee for the preservation of ancient buildings expended 150*l*. on the restoration of the Landgate. The Town Council then proposed to erect a very large "convenience" against the old structure. The lovers of antiquity have been enabled to obtain the services of Mr. A. H. TILTMAN as honorary architect, and in a letter dated the 4th inst. he wrote:—"If its erection is permitted, then a great part of, if not all the trouble that the committee and myself have taken to conservatively repair this most interesting monument of Mediaeval times will have been wasted, and a permanent eyesore established that will offend every inhabitant who has the least appreciation of antiquarian and archaeological remains." The committee for the preservation of the ancient buildings of Rye therefore requested the Corporation to, if possible, delay the work, so that time might be given for the consideration of either an alternative site or a scheme for using a portion of the present site without touching the towers of the Landgate, or so adversely affecting the view of the same. The contract for the "convenience" has been entered into, and any change will involve some expense, but the preservation committee, who have already laid out money in various ways, have expressed their willingness to contribute to the cost of alterations in order to save the ratepayers from unnecessary expenditure. A plan is to be prepared by Mr. TILTMAN in order to suggest a less objectionable site for the "convenience."

## COMPOSITION IN PAINTING.

THE word composition, in relation with painting, is only another way of expressing the phrase "unity in variety." There cannot well be composition without a number of parts to be regulated, and in figure-pieces they consist of separate representations of human and other beings. In landscapes there are also several components, each of them having sufficient independence to be made, if required, the subject of a special picture or drawing. Marine subjects are sometimes thought to be wanting in this quality, but a good artist will take care to give a distinct character to every wave, unless he is anxious to suggest a calm day when water is in repose. Then again, drapery and accessories should have imparted to them whatever is necessary to make them *sui generis*. If, as is commonly the case, they are made subservient to the figures and aid in unfolding their character, they can acquire an interest which does not belong to ordinary studies of draperies.

Masters of composition have not always been satisfied with making all the elements of a picture combine in attaining a single aim. They considered they possessed such mastery over the elements—that is, creative power—they were competent to put two or more independent compositions side by side. Painting thus resembled a fugue. But at the present day the youngest student of art would hardly require to be told to avoid the imitation of PAUL VERONESE, when on the right side of a picture he depicted CHRIST blessing the water in which He was about to be baptized, and on the left the Temptation of CHRIST. VERONESE could refer to many ancient bas-reliefs in which subjects still more disconnected were brought together. It was, no doubt, through the influence of antique art that the learned POUSSIN introduced in his painting of the Cure of the Paralytic a group of an old man giving alms to a woman. But more remarkable was the practice of RAPHAEL. In his last triumphant work of the *Transfiguration* he has inserted the figures of a couple of contemporaries who were concerned in the commission for the painting, as if they were adoring spectators of CHRIST. Still more astounding is the representation of people who are types of suffering, doubt and faith. We have in fact two pictures in one, resembling the sanctuary and crypt of a church. Criticism has invented many explanations in order to demonstrate that duality is a mark of the highest genius, but it would not be wise for any modern painter to attempt a similar experiment. In *The Dispute of the Sacrament*, another of RAPHAEL'S masterpieces, we have also a combination of celestial and earthly transactions, but in this case the arrangement corresponded with the popular belief that Heaven was not far removed from the altar of a church. The introduction of a figure of a Pope in some of RAPHAEL'S most important canvases is probably not to be attributed to the painter, but is rather due to orders which he could not disobey. The fact, however, remains that although the practice was common, our thoughts on seeing the more modern figures have to be diverted from their natural course, and instead of one great drama, we appear to have detached scenes from several. In a picture as in a drama, there should be no doubt about the protagonist. In the *Eliodora*, LEO X. appears as if controlling an incident which relates not only to the Biblical scene of HELIODORUS, but to the expulsion of ATTILA. When a difficulty of that kind arises it is impossible to have perfect composition, as the principal figure is an anachronism and the attention is distracted by its existence.

The error arising from the introduction of figures regardless of chronology is more marked when we remember how easy it is to arrange figures in such a way that those which we may call supplementary or rather superfluous will appear to be the most important. If the pyramidal principle be adopted a personage of trivial interest could be made to appear as dominating the whole group. In *The School of Athens* there would, for instance, be no difficulty in placing a cardinal who was a friend of RAPHAEL in the position of PLATO, and one of the Italian princes could be introduced as listening to SOCRATES instead of ALCIBIADES. From this fact it will be evident that a mechanical grouping, although in one sense it can be called composition, does not attain that truer and higher

grade which appeals to the intellect and is in keeping with the subject. Some early artists overcame the difficulty by writing names near the figures, and then it was less necessary to place the principal figure in the centre of the picture or to make it serve as an apex.

The arrangement of lines is important, and the old artists were not in error when they spoke of the means of union as a chain, and described one of the indispensable qualities of grouping as equilibrium, as if the figures formed a problem in mechanics and were subject to the laws of gravity. Sometimes the idea was expressed by a comparison to the pyramid, and at others to a "bunch of grapes." One remarkable example of that chainage is to be seen in RUBENS'S *Battle of the Amazons*, of which we published a large illustration. As a painting it may not rank high, and we are inclined to think that it was executed in order to demonstrate to his pupils the necessity of a connection between figures. The artist's aim is gained in a great measure by means of drapery; but although there may be too many scarves, the effect is more impressive than could be obtainable by the "bunch of grapes" of TITIAN and the Italians. The task was rendered more easy by the absence of any necessity to emphasise a principal figure.

It would be difficult to find a Greek work in which so much labour was bestowed in order to keep the figures in a big group and amenable to the artist's idea of composition. Some of the noblest scenes in Greek life were processions in which there was an approach to a republican uniformity of interest. In their paintings and in their reliefs they seem to express the processional idea, and with figures so arranged it was not necessary to have an elaborate system of composition. Perspective, being in an elementary state, was unable to allow of more than the simplest arrangements. Another drawback was the keeping of the figures on one plane, and if similar restrictions were imposed in our time composition would have to be simplified. MASACCIO'S *Restoration to Life of the King's Son* is a proof of the influence of the Greek principle, for all the men are of the same height, and they appear as if arranged to take part in a procession. This noble work is also an example of the indifference to order in time, if not in place, which was one of the signs of liberty or license of which early Renaissance artists took advantage. In one part of the picture the saint is seen blessing the boy, while in another he is seated on a throne with devotees around him. The picture would not be considered as exemplifying academic rules of composition, but yet it has a decorative charm unknown to works which are laid out on a scientific basis.

The latter incident indicates one of the differences between modern and ancient painting. MASACCIO'S patrons wished to suggest their reverence for St. PETER, and regardless of all laws of artistic propriety, they introduced a second figure of the saint. It was customary in those days for people to console themselves by manifesting their loyalty to the saints and their certainty of saintly protection. Pictures of the kind must have exercised an enormous influence in popularising pyramidal composition. RAPHAEL'S Sistine Madonna is the most prized of those examples, but we now possess another excellent one by him in the National Gallery. The Meyer Madonna, by HOLBEIN, is probably the latest important work of that class, and there is no doubt that in such pictures the arrangement of the figures is almost too regular. In sculpture, however, similar grouping is always likely to be adopted. Mr. HAMO THORNYCROFT, for instance, in order to produce the desired effect, makes his scholars of St. Paul's School kneel on each side of the seated Dean COLET, and in that way suggests the supremacy of the founder and teacher. HOGARTH, it may be remarked, thought the *Laocoon* had suffered in order to vindicate the principle of the pyramid, for he said the priest's sons are represented as little men rather than as children; but the peculiarity is more apparent in prints than in the statue itself.

With easel pictures it is possible to study them at leisure, and at length interpret the subject and identify the figures. But with mural decorations the case is otherwise. The great name of RAPHAEL does not prevent visitors to the Vatican from carping at him and condemning him because some of his figures cannot be explained by compilers of guide-books. In spite of the power displayed in the paint-

ing, the great series by RUBENS in the Louvre relating to HENRI QUATRE and MARIE DE MEDICIS is not appreciated, because it is now impossible to discover what the girls in bare feet and other figures have to do with State affairs. Allegory has its use in mural work, but it must be so plain that all who glance at it can understand it. We may patiently endeavour to make out the meanings of the mysteries which SPENSER expressed in fine language, but illustrations of the scenes are generally found to be too oppressive for the spectators.

While, however, we praise composition and recognise its importance, it will not make amends for the absence of other qualities. On this subject FUSELI said in his grandiloquent way, "whether its groups be embrowned on a lucid sky, or emerge from darkness, whether it break, like a meridian sun, on the reflected object with RUBENS, or, from REMBRANDT, flash on it in lightning; whatever be its form or its effect, if it be more or less than what it ought to be—a vehicle; if it branch not out of the subject as the produce of its root, if it do not contain all that distinguishes it from other subjects; if it leave out aught that is characteristic and exclusively its own, and admit what is superfluous or commonplace—it is no longer composition, it is grouping only, an ostentatious or useless scaffolding about an edifice without a base." In all but formal architecturesque paintings it is well that composition, or rather the planning of it, should not be too apparent. For as people do not form themselves into graceful groups unless under compulsion, there is a risk of the composition appearing to be a departure from nature.

### THE PULPIT.

THE subject which was assigned to the students of the history of architecture at the Ecole des Beaux-Arts a few weeks since was "A pulpit in a thirteenth-century church." It would not be becoming in us if we were to doubt the fitness of any exercise selected by M. MAGNE. But it is generally believed by archaeologists that no thirteenth-century pulpit has survived. DE CAUMONT, who was well acquainted with French churches, says he never met with a pulpit in one of them that was older than the fifteenth century. He refers to two, St.-Lo and Vitre, oriel pulpits, which were constructed externally to the churches in order to serve for sermons delivered to congregations in the churchyards. He believed that the pulpits in Strasburg Cathedral and Friedburg were not more ancient. Those belonging to earlier Gothic periods were probably made of wood, and that may account for the difficulty of discovering examples. Some of the carvings were probably used in structures of another kind, but there is a limit to the endurance of wood-work.

It is remarkable that M. MAGNE did not supply the students with any example of a thirteenth-century pulpit, but as a substitute gave a sketch of one more ancient, which is still to be found in the church of Brancoli in Tuscany. This is formed of stone, and the upper part stands upon columns which are supported by lions. There is a projection from the cornice forming a lectern, supported by an eagle. It is not without analogies with the modern type. VALERY described a pulpit as existing in the church of St. Ambrose, Milan, which was better adapted for oratorical action. "In this church," he said, "there is an immense old pulpit of marble opposite to the modern one; it is pretty much like the gallery used by the Romans, in which the orators had room to walk about. It struck me, while contemplating it, that in form as well as independence the Christian pulpit had replaced the *suggestum* of earlier days. These old pulpits are in much better taste than the kind of deal box suspended in our churches, above which rises a man who twists and agitates himself, and seems ill at ease in so narrow a space. Were not one habituated to this manner of preaching it would appear a very singular exhibition." The *suggestum* or *suggestus* was also the elevated spot from which soldiers were harangued by the general, and it was sometimes used as the lofty seat of the Emperor when viewing the public games.

It was allowable for M. MAGNE to invite his students to design a pulpit for which there was no precedent, but

which would be in keeping with other parts of a thirteenth-century building. They would certainly have been more usefully employed if they had endeavoured to design a pulpit which would be without the shortcomings of those which prevail in modern churches, because it is supposed invention is not exercised in anything which is to be employed in the services.

One of the difficulties attending an investigation of the few forms of pulpits arises from the uncertainty about the time of their origin. It is sometimes maintained that the ambo was the first pulpit, but it was used for reading epistles and gospels rather than for the delivery of original discourses. Orators amongst whom the traditions of pre-Christian Rome continued to have influence were not likely to be satisfied with being boxed up in a receptacle which restricted the amount of action. They were likely to seek a platform or stage like the Milanese example, which would allow of several steps being taken—action which is found impossible in any pulpits resembling those in modern churches. In the open places of some of the remote Italian towns we can still see friars occasionally exhorting congregations from temporary platforms, and the spoken word becomes more impressive from the dramatic action with which it is accompanied. One effect of confining orators to the limited area of the ordinary "tub" has been the partial extinction at least of that action or stage play which, according to DEMOSTHENES, was the first, second and third essential of eloquence. When we learn that a great preacher like BOURDALOUE, who must have been possessed of a Frenchman's love of gesture, was accustomed to close his eyes and to rest his hands on the rim of the pulpit during his sermons, we can understand how he was hampered and why many believed he was not an emotional orator. MASSILLON was less restrained, but as he sometimes used to cross his hands on his forehead as if he were afraid to hurt them against the pulpit, we must conclude his strongest effects were produced by the style of his delivery, without much aid from action. When the principal actor of the day once heard him, he said, "He is an orator, and men like myself are only comedians," but it was the sincerity of the utterance which made the impression, not the correspondence between action and expression.

Whatever was the cause which induced the clergy to adopt so circumscribed a variety of pulpit, there is no doubt it had become popular by the beginning of the thirteenth century. At that time NICCOLO PISANO produced his wonderful pulpit in Pisa, which although its decorations are partly copied from Pagan bassi-relievi, marks the beginning of a new era in the history of sculpture. The fine pulpit in the Santa Croce, Florence, by BENEDETTO DA MAJANO, is of a later time, and the reliefs deserve all the praise which VASARI bestowed on them, but the general effect is not as satisfactory as the details. The pulpits in San Lorenzo, Florence, which DONATELLO designed and his pupil BARTOLDO executed, are not unworthy of being under the same roof as the *Night, Dawn* and *Armed Thought*, of MICHEL ANGELO.

We need not trace further the progress of the pulpit, although the variations are few. Judging by many of the examples it would appear that so long as the enclosure for the preacher was respected designers might introduce what novelties they pleased. As specimens of sculpture in wood it would not be easy to surpass the figures of the Belgian pulpits, such as *The Temptation of Adam and Eve* in Brussels or *The Calling of St. Andrew* in Antwerp, which are introduced around the support. The figures are, of course, diminished in their effect by the clouds, drapery, birds and other incongruities which are near them. But the body of the pulpit is unaltered, and therefore the design was approved. Another type for which we can claim the design as well as the ownership is the two and three-decker pulpit which was once common throughout England, and which some amateurs would wish to see revived. But the preacher, together with the clerk, were partly concealed, and so long as that is secured the majority of ecclesiastics are satisfied.

It is the predilection of the clergy for an enclosure which perpetuates an arrangement which has many disadvantages. They consider, no doubt, that while they are surrounded by a fence of stone and wood they are secure from criticism and need not be afraid if their sermons are

not productive of much good. Small men are, however, made to appear as if out of place, as it is difficult for the most eloquent man to become impressive when little more than his head can become visible. There are, besides, other drawbacks. Mr. DU MAURIER's superior parson objected to his pulpit because it was impracticable for him to make every fold in his surplice tell, but we suppose such minor worries are of little account.

With the clergy in favour of one form, it is no wonder so little can be done by invention in order to introduce pulpits that would be novel and could be made auxiliaries to eloquence. At present there is more fitness when a clergyman speaks from a reading-desk, although by his renunciation of the right to fulminate over their heads he becomes more akin to the congregation he addresses. In a French church sermons are sometimes delivered from the steps of the altar, and it cannot be said that the effect is in any way diminished. Other priests endeavour to submit to the obstacles to fervid eloquence which the pulpit offers by sitting instead of standing, and making a *causerie* of their discourse. Remembering these facts, M. MAGNE might have suggested a different treatment from that which is exemplified in the Romanesque chapel of Brancoli, as well as in the majority of modern churches, and the effect of the innovation would not be confined to France.

#### LORD LEIGHTON'S HOUSE.

A PUBLIC meeting has been held in the Town Hall, Kensington, in support of the movement for the permanent maintenance for the borough and the nation of the house and grounds of the late Lord Leighton, with the collection of his drawings and sketches.

Sir H. Seymour King, M.P., the mayor, presided, and said that by the generosity of Lord Leighton's two sisters there was placed within their reach a rare treasure, and the question they had to answer was whether they should put out their hand and grasp it. They had the opportunity of acquiring the house in which Lord Leighton lived and worked, with its rare art treasures. All that was needed was a little money in order to endow the house in a modest fashion with the means of maintaining it. He was permitted to say that the King wished them every success, and would be very glad to see their idea carried out.

The Bishop of London moved the first resolution as follows:—"That this meeting warmly supports the movement which has been inaugurated, having for its object the dedication to the public of the house and grounds of the late Lord Leighton and the collection of art treasures secured therein, to be a memorial to that great artist, and as a public gallery, museum and centre of art work for the borough of Kensington." He said the Bishop of London was concerned with all that made for the happiness of Londoners, and therefore it was his duty to support any movement the object of which was to brighten the lives of the people. A long experience among the poorer classes had convinced him that they appreciated beauty of sound and beauty of form. Many who lived in the neighbourhood of Lord Leighton's house were poor, and it was partly for the poor who lived in the district and who could not obtain these things for themselves that the art treasures were intended. He could think of no more beautiful memorial to a man than the dedication to the public of the things which he had collected and loved, for they breathed, as it were, his very spirit in their midst. Another reason why he gave his cordial support to the scheme was that the house would be the centre of art teaching for the population of Kensington.

Sir William Richmond, R.A., in seconding the motion, said it did not fall to the lot of every generation to commemorate a great artist, a great man also, in so fitting a manner as that in which it was proposed to do in this instance. Leighton was a great artist; he was also a great man, a man of whom not only his country but foreign nations had a right to be proud. Facile and brilliant, Leighton was never satisfied with his achievements; his modesty was as conspicuous as his activity was untiring; the power of taking pains was a gift cultivated in him to perfection. If one word more than another applied to Leighton it was nobility. His was a name which engendered in many enthusiasm in all respects. The intention of the scheme was that the house should be maintained for the nation as a centre of all that was most beautiful and elevating in art, music and letters, and an intellectual possession accessible for the poor as well as for the rich. That intention was in complete harmony with Leighton's whole life.

Sir Robert Hunter, in supporting the motion, remarked that the house was especially adapted for public use.

Sir Martin Conway also supported the motion, which was agreed to.

Earl Percy, M.P., moved:—"That representations be made to the Borough Council of Kensington inviting their co-operation in securing the success of the movement, and suggesting that the Council might fitly commemorate their inaugural year of office by accepting the gift of this property and permanently maintaining it under their statutory powers as an institution for the encouragement of the study of literature, science and art in the borough." He said that the cost of maintaining Leighton House, if it were taken over, would not amount to more than a farthing rate, in addition to the library rate, once every three years. If the borough council could see its way to carry out the wishes of the meeting, Leighton House in their possession would be not merely a school of art, a museum of priceless curiosities, a concert or a lecture-hall; it would be a perpetual memorial of one who was a great citizen as well as a great artist, and a perpetual record of the pride and reverence which Kensington felt for one of the best and most distinguished of her sons.

Mr. Lionel Cust seconded the motion, which was supported by Mr. Thompson Sharpe, M.P., and Alderman Frye, and unanimously agreed to.

#### THE FRENCH EXPLORATION OF SUSA.

THE French expedition which for some five years has been engaged in the exploration of the city of Susa, the capital of the ancient Elamite kingdom, under the direction of M. Jacques de Morgan, has now completed its work, and a most valuable series of memoirs are being prepared by the director and other members of the expedition, and published by the Ministry of Public Instruction. The work of the mission has been so quietly carried on, says a correspondent of the *Scotsman*, that outside of the small circle of specialists in Assyriology, but little has been known of the very important discoveries that have been made, and which have added a new and important chapter to the reconstructed first volume of Oriental history. The site of Susa was an important one, and the early connection between Chaldea and Elam led archaeologists to hope that important results might be obtained, and these expectations have not been disappointed. Between the lofty ranges of Bakhtiari mountains which rise step by step like a giant staircase to the tableland of Iran, and the Tigris there stretches a rich plain watered by the Kerkhah, the Karun and the Dizful, and in the heart of this plain a few miles north of the town of Shustu are the two great tumuli which mark the site of the ancient city of Susa. The larger of the two mounds was partially examined by Loftus in 1850, but in 1884-86 it was carefully explored by M. Dieulafoy, who found it to contain the remains of the Apadanans, or palaces of Darius and Artaxerxes Mnemon, and the antiquities are now in the Susanian saloons of the Louvre. The smaller mound, manifestly an older site, appears to have been but little touched, though Loftus must have obtained his Elamite bricks from this site. This mound rises to a height of about 100 feet above the plain at the highest end, and has a length of 1,600 feet. The mound bore every indication of being an accumulation of the debris of more than one city, and acting upon his experience as an engineer, M. de Morgan decided to test its strata by a series of tunnels driven into the mound at various levels. The result of these test tunnels at once showed the great antiquity of the site. Space will not permit of a detailed examination of the various strata thus penetrated, but the following table will show the successive layers commencing from the base, a few feet above the level of the plain:—

1. The virgin soil, a pebbly ridge formed by the rain torrents from the high lands.

2. First settlement 10·93 metres above the plain. Pottery, hand-made, with red and brown decoration, similar to that found in the prehistoric settlements in Egypt and a few worked flints.

3. Second settlement 14·30 metres above the plain. Traces of a settlement of huts having been destroyed by fire. Pottery of a similar class to former settlement, but not so numerous. Large quantities of worked flints and quantities of the flint teeth of wooden sickles similar to those in use in Egypt.

4. Third settlement, 16·80 metres above the plain. A settlement destroyed by fire. Here enormous heaps of the sickle teeth were found, indicating that agricultural implements had been piled in heaps and the wooden frames decayed. Some of the teeth bore traces of the bitumen fastenings. Stone maces.

5. First town, 21·25 metres above the plain. Here traces of burnt brick walls were found. Also tanks or wells lined with terra-cotta pipes of large size.

6. Anzanian city, 29 to 30 metres above the plain. Traces of palaces burned with fire, and bricks inscribed with names of Elamite rulers. The city destroyed by Assurbanipal B.C. 640.

Above this was a layer of Greco-Persian remains, but no

trace of buildings; and on the surface Arab and modern Persian pottery left by nomad tribes encamping here in the summer. Here we have set before us in a regular sequence the history of this most important site. The Plain of Anzan, for such was the ancient name of this region, was always celebrated for its corn-growing qualities, and indeed is so to the present day. Strabo, writing on the fertility of this region, states that wheat produced a hundred, and sometimes two hundred fold; but more important still are the references to the rich corn harvests of Elam in the Assyrian inscriptions. The origin of the settlements is shown in the immense number of sickles found, which indicate that in very remote times the site was occupied by hill tribes during harvest and then abandoned, the sickles being piled in heaps. Two of these settlements, consisting of huts, had been destroyed by fire—perhaps by a raid from Babylonia, and then replaced by a small village settlement. In this last settlement traces of a water supply were found, and the only arms stone mace heads similar to those found by De Sarzec at Tello and by Petrie in the prehistoric settlements of Egypt. There was, however, no trace of writing nor were the mace heads sculptured, so that this first town is probably older than any in Chaldea.

It must be remembered that far back as the researches at Nippur, Tello and other Chaldean cities extend, to probably B.C. 5000, we have as yet no trace of a prehistoric age. If, then, this first town is prior to that age, what degree of antiquity must we assign to the settlements which precede it?

The historic age of this site really commences with the city found at a depth of about seven metres below ground. The extensive traces of fire and the deliberate demolition of the walls show that this was the city destroyed by Assurbanipal in B.C. 640, when he wreaked a terrible vengeance on the city for aiding his rebel brother Samas-Sem-ukui. The inscriptions discovered upon the site show that although the great hall of the palace was erected probably by Sutrak-Nakh-Khunti about B.C. 1100, there were at least portions very much older, probably about B.C. 2800, or even earlier. The bricks obtained by Dr. V. Schiel, the Assyriologist attached to the expedition, are almost as astonishing as the excavations in the tale they tell. The earliest bricks are written in cuneiform characters, not those we have usually been familiar with as the script of Elam or Anzan, but in a writing exactly similar to the archaic inscriptions of Chaldea. Moreover, they are not written in an Elamite language, but either in pure Semitic Babylonian, or in two cases in Sumerian. Here, then, we see that it was Babylonia that introduced writing, the chief element of civilisation, into Elam. Taking one of the oldest of these bricks we read—"To the god Susinak his lord for the life of Idadu, viceroy of Susa, Ardum-naram-Susinak (servant beloved of Susinak) (has given)." The title viceroy (patisi) naturally implies an over-lord, and that can only be found in Chaldea. We now see how it is in Genesis x. 22. Elam becomes the eldest of Shem, as being the first colony founded during the Semitic dynasty of Babylonia. Among the inscriptions found in Chaldea were several contracts of Naram-Sur, the son of Sargon, dated in the year "when he placed homage on Elam." By certain German critics, all such inscriptions of Sargon or his son were to be regarded as unhistorical. Among the bricks and other remains found at Susa are some bearing inscriptions of Naram-Sur, showing that he not only conquered the city, but also erected buildings there. So this ascribes a date of at least B.C. 3800 to the Elamite capital. Most important of all was the discovery of a great sculptured stile of victory of Naram-Sur, which had been set up by that conqueror at Sipir, one of the cities of Elam, but removed to Susa by the Elamite king Sutrak-Nakh-Khunti, who placed an Elamite dedication of his own upon it. So that the historical antiquity of the city is beyond doubt. Among the inscriptions found were many of the Kassite rulers of Babylon (B.C. 1800-1100), who it appears conquered Susa on their way down from the mountains to Babylonia. Some of these are of the greatest historical importance, but space will not permit of our dealing with them in this notice. It needs no comment to show of what immense importance these explorations are, and how M. de Morgan and his colleagues have added a new and important chapter to the history of the East, and given to civilisation in Western Asia a retrospective enlargement totally unexpected.

## DECORATION METHODS AND MATERIALS.

IN attempting a short description of the methods and materials employed in interior house decoration at the present time, I shall endeavour, writes Mr. W. H. Elliott, of Toronto, in the *Canadian Architect*, to be as concise in my statements as possible—describing the material, its advantages and disadvantages, where it may or may not be used satisfactorily, and so of the methods employed.

As in other things, decoration has its fashions. Styles come and go in public favour, and in five years the decorations of a

house may be quite out of date. This would be unfortunate if it were necessary. Many styles are never out of date, and they are usually the most desirable, temporary styles having their destruction inherent in themselves. It is quite possible to carry out a scheme of decoration which if entirely appropriate to its position will always give lively satisfaction both in colour and design.

I might also refer to some notions at times prevalent about the use of colour which do duty for the time as decorations. Not long since I heard a lecture in which the theory that each colour symbolised an abstract idea was gravely set forth, as that red was love—yellow, aspiration, &c. The folly of attempting to embody such ideas in schemes of decoration would be apparent to anyone giving only slight attention to the subject. Of equal value was a scheme for the decoration of a church in which the colour of the lower wall represented the bark of trees, higher up the leaves, then a golden sunset, and above all the pale green and hue of the evening sky. Very fanciful no doubt and possibly resulting in good hands in a harmonious arrangement of colour; but on what ground are we to transfer bodily the outer landscape to the walls of a church?

The possible scheme of colour is not objected to, but the gravity with which these and similar fads are presented as principles of decoration. The principles of decoration are worked on other lines. The amount of light usually governs the strength or depth of colour; the presence or absence of sunlight has its due weight, the purposes of the room, the tastes of its customary occupants and a hundred other considerations which are not fanciful, but very practical, influence the decorator in his work.

To follow some of these theories would be to tie ourselves to a certain arrangement for certain conditions in every case. For example, a very cheerful room may be carried out with blue as its motive colour (no matter what its signification may be), and a very dismal room may result from a badly-balanced scheme in yellow. And here let me say that in most cases one colour should strongly predominate when a successful effect is desired. Too positive colours in nearly equal proportions are fatal to repose of any room. The exception to this is, of course, when the colour is thoroughly broken up as in the Moorish or Romanesque styles. Another rule which is very safe is that all three primary colours should be represented in every scheme of decoration, otherwise a tame effect is certain. The red or yellow may be very much subdued in a blue room, and so of the other combinations, but their presence, if ever so quietly introduced, is unconsciously felt as a satisfying impression.

Looked at from the standpoint of durability many of the materials employed are far from satisfactory, but, happily or unhappily, durability is not often considered in present day decoration. The universal surface material, plaster, is anything but durable. Various attempts have been made to produce substitutes, but thus far without conspicuous success. For small surfaces what has been named plaster board is something of an improvement. It is usually a thickness of plaster-of-Paris or asbestos in which coarse canvas or scrim has been incorporated. When this material is cast in ornamental forms such as cornices, friezes, centres, &c., it is called staff. Lightness and strength are obtained by this method, and some comparatively large sections have been cast in this way.

For finer ornament various compositions are used which admit of plastic moulding to a limited extent. Ornament of this nature has become necessary on account of the extensive use of the French styles of the Empire, Rococo, &c. As a practical substitute for plaster the sheet metal designs so largely placed on the market at present are very satisfactory where the decorative effect is of little importance. They can hardly be classed as decorative material.

Where any work of importance is contemplated it is advisable to first cover the plaster surface with a strong cotton or burlap, so that cracks may not eventually injure the appearance of the work. Burlaps of various degrees of coarseness are now used extensively for covering wall surfaces, and are invaluable for the purpose—the texture giving an excellent surface for colour or decoration. The colour is obtained either by painting the burlap after it is fixed or by using the ready-dyed materials which may be obtained in all desirable colours. Burlaps, cottons and other similar materials are applied to the wall with ordinary flour paste, the wall being pasted instead of the material. Joints should be overlapped about an inch to allow for shrinkage, left several hours, then cut through both thicknesses with a sharp knife, the strips removed and the two edges brought neatly together. Dyed material does not require overlapping as it is already shrunk. For painting a rather open weave is preferable, the colour not filling it so as to hide the texture.

Decoration in glaze colours, outline relief work and other methods are employed with excellent effect on the painted burlap. Silks and woven tapestries are also used to a limited extent for covering the walls of the more important rooms of

the house. The cost of these both in material and application is, of course, much greater than that of other coverings, and it is questionable if the results gained justify the additional cost. These materials are usually tacked to thin strips of wood which have been nailed on all angles of the wall, the joints being concealed by silk cord gimp or rounded strips of wood which have been covered with the wall material. A lining of ordinary cotton or Canton flannel is usually applied first to the wall to protect the more expensive material from dampness and to give a softer surface. Hand-woven tapestries are only possible to the very few, so that practically we are confined to the products of the machine loom. All of these are closely reproduced in the many beautiful wall-papers now to be had. I have always maintained that such imitation is perfectly justifiable, as the material or groundwork is only a medium for transferring the design to the wall and of no importance in itself beyond its suitability for the special work in which it is employed. Ordinary silk will not retain its appearance on the wall as long as its reproduction in wall-paper, its texture making it a receptacle for dust, smoke, &c., which in a short time completely ruins its surface. No doubt this is more especially true of our houses in Canada, shut up closely as they are during a long winter with the accompanying accumulation of dust.

This brings us to the consideration of wall-paper as a medium for decoration—a material more generally used than any other, and undoubtedly more broadly adapted to the various requirements of house decoration. As I have already said, wall-paper has been designed to reproduce other materials in a cheaper and more practical form. Silk, leather, tapestry, cretonnes, &c., are now to be had in wall-paper in their choicest designs. The first cost of die-cutting, &c., being distributed over a large output, the richest and most elaborate examples of each fabric may be copied. How one is deceived by these reproductions when on the wall, but one may have the very best of design and weave the world affords, while if attempting to use the actual fabrics only a very moderate and perhaps undesirable selection is possible. There is, of course, a very large range and very superior range of designs which are not copies of anything but simply wall-paper.

Wall-papers are broadly divided into hand-made and machine-made—pressed flat, gilt and colour. The manufacture of hand-made papers follows somewhat the earliest type of printing press, but while the old printing press has long been discarded, the hand or block printing machine still retains a large place in wall-paper manufacture. The advantages are a more solid layer of colour and as a consequence a more forcible effect on the wall. Large designs also may be printed with blocks when the expense would be too great to construct a machine for the purpose. But of late years, with perfected machinery and skilful printing many designs are produced which test the ability of an expert to detect as not hand made. The best designs come from England—that is, designs which are purely wall-paper, not imitations of any other fabric. Such men as Burne-Jones, William Morris, Lewis F. Day, Walter Crane and others have given their best efforts to the designing of wall-paper and the result is what might be called a school of wall-paper design, which is drawn upon by the designers of other countries. These men by no means treat the wall as in all cases merely a background for other things, but rather as an important feature in the furnishing of the room. Of course where important pictures are to be hung many of their designs would be quite inappropriate, but unfortunately the number of important pictures bears a ridiculously small proportion to the number of rooms to be decorated. French designs excel in reproduction of silks, leathers, &c., and many of their papers are exquisite examples of the art of wall-paper making. By far the largest proportion of designs are studies of natural flowers slightly conventionalised. Always popular and easier of treatment than ornament, they peculiarly appear in the season's lines, although the really good floral designs of one season could be counted on the fingers of one hand.

Within the last year or two the reign of the frieze has perceptibly drawn to its close. At one time considered a sine qua non in every room—in fact almost as essential as the furniture—it is now relegated to the cheap parlour combinations as they are called, where ceiling, frieze and wall are beautifully matched, saving brains and much anxious thought to the dealer and the buyer. Wall-papers are now usually carried to the ceiling or cornice and finished at the top with a picture moulding. Ceilings if good are painted or tinted, if cracked are papered with something simple in design and of almost one colour. Sometimes the ceiling colour or paper is brought down a short distance on the wall to meet the wall-paper at the picture moulding. Sometimes the upper third of the wall is covered with a different design from the lower two-thirds, the picture moulding again acting as divider. A very pretty treatment for bedrooms is to carry a narrow border around each wall of the room forming them into large panels. These borders frequently have corner pieces to match. Papers

with the texture of burlaps, denims, &c., make a very good lower wall and are an excellent background for pictures. Ingrains or cartridge paper are now very little used. Pressed or raised papers except in leather effects are not much in use, good colouring being preferred to their somewhat showy effect. The stripe designs which come to us at present in such abundance will not continue to occupy so large a place in dealers' collections, yet they have an important use in giving an appearance of height to rooms whose ceilings are undesirably low, besides being an agreeable change from the ordinary run of designs. The old cretonnes and chintzes furnish a range of beautiful patterns for bedrooms, morning-rooms, &c.

The proper treatment for all of these patterns is to simply cover the wall with them, as would be done with the actual material.

Coming to the woodwork of the room, we find a variety of new tones for natural wood. Rich browns, deep mossy greens, Flemish oak finish, may be applied to ordinary pine or white wood with highly satisfactory results. The strong reds and greens of the wall at once call for special treatment of the woodwork, and these deep tones are the result. In direct contrast are the white and ivory tones which set off equally well the reds, greens and blues of the wall. The old-fashioned drawing-room in white and crimson or green is very much in evidence at present, while in the bedchambers white woodwork prevails, almost to the exclusion of everything else. Graining, while not tabooed on æsthetic grounds as formerly, does not seem to find a place with other prevailing features. Oak among hardwoods is in great favour, but more frequently finished in Flemish bog oak colouring than in the natural wood.

One of the most desirable importations of old-world ideas is the more general use of hard-wood floors. Very few realise the danger to health which lurks in the harmless-looking carpet which in many cases remains securely tacked to the floor for several years. An analysis of the dust accumulated in that time has revealed possibilities of disease which in many cases must have resulted in the actual thing.

A permanent floor may be laid in any house on top of the existing floor without alteration to doors or other woodwork of the room and at the cost of ordinary carpet. Parquetry designs add decorative character to this part of the room. Not the least important advantage gained by the use of hard-wood floors is the introduction of the very artistic and everlasting Eastern hand-made rugs which now adorn so many of our homes. When the life of these things is considered the money expended upon them is probably the best investment possible in house-furnishing.

## BRITISH AND AMERICAN ENGINEERS.

LAST year, on the occasion of the French Exhibition in Paris, a large party of American engineers, both civil and mechanical, visited London, and the presidents and councils of the Institutions of Civil and Mechanical Engineers organised receptions and conferences, excursions and invitations, for their entertainment. In acknowledgment of these courtesies two beautifully illuminated addresses have just been received by the Institution of Civil Engineers, one from the American Society of Civil Engineers and the other from the American Society of Mechanical Engineers. The board of direction of the American Society of Civil Engineers, in their address, say:—

"Apart from the professional feature, the graceful and magnificent entertainments and excursions arranged in behalf of American engineers are highly appreciated by our members, individually and collectively; the more so from a realising sense that such a reception could have been carried out only by an Institution whose standing and position before the public are established beyond question. While, therefore, our thanks are due primarily to the Institution, we desire to record our profound appreciation of the high honour conferred upon the profession in America by Her Gracious Majesty Queen Victoria in receiving its representatives at her Castle at Windsor. We also wish to acknowledge the charming hospitality of the Earl and Countess of Warwick, and the kindness of the Lord Mayor, Aldermen, and Common Council of the City of London in tendering their ancient Guildhall for the occasion."

The address of the American Society of Mechanical Engineers is as follows:—

"We, the President, Council and members of the American Society of Mechanical Engineers, in full recognition of the hospitality extended to us by your Institution during the past summer, hereby extend this official acknowledgment. Realising the profound international significance at this time of certain of the events included in the reception by the Institution of Civil Engineers of their American professional brethren, and fully appreciating the remarkable social courtesies so gracefully extended, we here record the sincerest thanks of the

American Society of Mechanical Engineers. In all those graceful courtesies, the ever-growing ties between the members of the Anglo-Saxon race throughout the world are evidenced and strengthened. We take this as a welcome opportunity to record our deep appreciation and hearty thanks."

### THE FUTURE OF ENGINEERING.

AN address to the students was delivered by Colonel Henry G. Prout at the Rensselaer Polytechnic Institute, in which he said:

Your first lesson will probably be in measuring your own strength with that of other men. A good deal of this you have had in college, but now it comes in a different way. Heretofore the struggle has been to meet conditions already laid down. Now the field of your efforts is bounded only by your own abilities, and if I were to specify one quality more important than any other in the work now before you, it is courage. The gods are always kind to a brave man. We have assumed so far that at this institution you have learned the principles of your art. Beyond that we are justified in assuming that you have trained your powers of observation of analysis and of reason. You have now to ascertain and to prove that you have the courage to use your weapons. I should say that one of the great lessons of human experience is never to admit, to yourself or to others, that you cannot do the job that you see before you. Voltaire said, "All general statements are false, and probably this one is also;" so what I am saying about the courage to attack anything that comes along will naturally work within reasonable human limits, knowing that probably there is not one Newton or one Napoleon among you. But my point is that more men fail from timidity than from too much courage. But do not imagine that courage does not see the dangers of the enterprise; that would be mere stupidity or blind conceit. I have a friend who has risen fast, and now, while still young, he is the president of a great railroad. He said to me the other day, "I never yet undertook a big job without being scared."

It has come in my way to know a good deal about the entrance of young engineers into railroad life. I have talked much of this with railroad men, and have had some experience of my own. The sum of the testimony is that engineering schools are the best recruiting ground for railroad officers. But it is pretty well agreed that when the young men come out of these schools they cannot draw, they cannot use their mathematics, they cannot write an acceptable English document. Here, again, we are speaking in general terms, but probably we are not far wrong. Of the drawing it is too late to talk now. If you are not good draughtsmen it is not likely that you ever will be. Of the mathematics I may perhaps say a useful word. It is not a question of higher mathematics, but of the everyday bread-and-butter mathematics. This is where the young graduate is deficient, and where he can quickly supply his deficiencies. For example, not long ago I asked a young man who had graduated with distinction at one of our best engineering schools to convert kilogrammes per square millimetre into pounds per square inch. It was a case of some tensile tests. After a good deal of labour he presented to me the astonishing conclusion that the specimens had broken under a strain of 0'221468 pound per square inch. You will observe that the precision was very great, but that the error was greater. Probably he had not come within 79 or 80 thousand pounds of the truth. I should advise you to begin at once to learn the short cuts in computation, and also to learn to use your sense as to the accuracy required in each operation, or possible in each operation. You must often have heard of the young engineer who paced the diameter of a circle and then multiplied the diameter by  $\pi$  carried to fourteen places of decimals to get the circumference. I have actually known an engineer to design a section of a rail with such precision that he expressed the width of the foot of that rail in six places of decimals.

I have spoken of the defective English training with which the young engineer is apt to start. This is a good deal more important than you are likely to suppose, and it is easier to correct. But first let me warn you against mere fluency in writing or in speaking. That is likely to produce bad English and not good English. You will remember Carlyle's saying about the English, that of all people on the earth they are the stupidest in speech and the wisest in action. The harm done and the fatigue inflicted by fluency are such that I have often thought that it would be a blessed thing for humanity if we were all struck dumb for a year.

But a clear, simple, accurate and, if possible, distinguished English style is a precious possession to the young engineer, and it is within the reach of nine men out of ten. It will come from so saturating your minds with good English that bad English is offensive. It is a mere matter of taste, and there is

no such thing as acquiring taste by rule. You might as well expect to become a judge of tobacco by talking about smoking. If, then, you wish to master a good English style, read good English. Read little of it, but read it thoroughly and constantly, and never read anything else. Do not read the daily newspapers further than to get the sort of information that every intelligent citizen ought to have.

You are permitted to enter on your work at the beginning of one of the greatest epochs in the history of our country. During your active lives our population will be doubled. That will mean more consumers, more producers and more competition. These opportunities will be multiplied and so will the men who do the work. We shall become the greatest manufacturing nation, the greatest carriers of ocean commerce and the greatest shipbuilders. In all of this the engineer must supply technical knowledge. His work will not be as picturesque as in the past, but there will be more of it and it will be of even greater importance to society. But, further, the engineer will invade the field of administration. He will gradually take the executive offices in the railroads and in the great industrial corporations. For this there are several reasons.

First, the day of the scientific man has come and the engineer will go to the front because of his technical acquirements. Second, his education and his experience develop those intellectual qualities which are required in handling great affairs, namely, observation, analysis and reason. But third, and most important, his education and experience will have developed the highest moral qualities. The engineer does not regard himself as a moral leader, probably he never thinks of that part of his work. But he is, and he must be, a moral leader, for his whole teaching and experience lead straight to absolute honesty of thought and purpose. If he is not fundamentally honest in his thought and conduct nature finds it out and his dam goes out, or his bridge falls, or his machine fails. He cannot be a sophist and an engineer at the same time, nature does not permit it. I remember seeing the matter stated by Macaulay somewhat in this way:—The man who reasons for some actual end in practice must be accurate. For disputation he needs no correct premises and only so much logic that he will not be caught.

Fortunately it happens that directly in proportion to the zeal and fidelity with which you serve the profession will be your fame and influence in that profession, and in such proportion will be the riches and the glory that will come to you. This again is a general proposition, certain to fail in many cases but true in a large way.

And how are you to serve that profession? There is no special recipe; the only way is by being brave and honest gentlemen and by using with diligence such faculties as the Lord has given to you. I will give you one bit of experience which may be of a little use sometime. About once in so often someone says that the engineers ought to adopt a code of ethics. He thinks a formal code would keep one engineer from stealing another engineer's job, or his glory, or something else that is his. My argument is that a code would bind the conscientious man and would not bind the roguish man or the man of coarse perceptions; the Ten Commandments, the common law and usages of decent society are code enough for any man in any profession. I venture the proposition that the codes of the medical associations have done great harm to society by the protection that they have thrown around incompetent physicians, and they have hurt the profession more than they have helped it.

I judge that in the next ten years or so the social use of the professional man will be far greater than it has even been in the past. To him society must turn for help in the great new problems raised by the combinations of capital and of labour. It is not likely that the law will find a way to stop these combinations; it is doubtful if it is advisable that they should be stopped; but they must be directed and perhaps controlled in some degree.

The business man measures his success by the money profit that he makes. He may or he may not have produced a beautiful article or a useful article; he may or he may not have added to the health or the happiness of the group of people just around him. These considerations are secondary; the primary considerations are dividends. Mind, I am not expressing an opinion or criticising motives; I am stating a fact. On the other hand, the primary consideration with the professional man must be the interest of his client, whether that client be a man or a city or state. He can think only incidentally of his fees. In fact, much fine professional work—much of the work most useful to the world—is done without any fees or money return whatever. Fortunately for the progress of the human race, man is endowed with a sense of duty, with a thirst for knowledge, with a desire for the approbation of noble minds. So the true professional spirit is evolved, and this spirit must save the railroads and the great industrial corporations from some of the disasters which arrogance and ignorance are provoking.

## NOTES AND COMMENTS.

CHEVREUL, the French chemist, did more than any of his predecessors to place the laws of colour on a scientific basis. Great artists before his time produced wonderful effects not only in painting, but in pottery, stained glass, textiles, &c. But every follower of the arts is not endowed with instincts equally strong, and it is well to have a guide which will prevent any discords in the opposition of tints. CHEVREUL's scheme of arithmetical proportions for contrasts of colour may be reckoned as only an empiric solution of subtle problems, but they have at least prevented many errors. It is, therefore, satisfactory to learn that a statue of the old Professor has been set up in the Jardin des Plantes in Paris. The sculptor, M. LÉON FAGEL, was well inspired when he represented CHEVREUL as he knew him—that is, as a venerable gentleman who had attained 102 years and bore them lightly as a flower. He was a great deal more airy in his manner and more able to enjoy life than many of the dandies who are to be met with in Paris. The figure suggests that the chemist must have discovered the elixir of perpetual youth, and as in the Quartier Latin most of the statues represent very serious men, the contrast offered by M. FAGEL's work is, therefore, gratifying.

As a reward for the zeal of the citizens in realising the International Exhibition, the Cross of the Legion of Honour was conferred on Paris. The distinction will not appear to foreigners to have much value, but if it reconciles the bourgeoisie to the increased taxation a political stroke was accomplished which will bear imitation. It is remarkable that the first public monument which is to display the order will be the memorial of CHARLES GARNIER outside the Opera House. That work which required some difficulties to be overcome in laying the foundations appears to be advancing. M. PASCAL, the architect, has obtained several large blocks of stone from the Government dépôt, some of which were quarried in the time of the first NAPOLEON. As the expenses will be heavy contributions are sought from other countries. A committee has been formed in New York to collect subscriptions, and it is expected 1,000 dols. will be obtained.

WHEN metal was first used as a material for columns and girders the loads to be supported must have been remarkably well behaved. They were always found in the positions which gave least trouble to the constructors and to the makers of formulæ. More modern loads have a tendency to irregularity and seem to strive for a lopsided support. It is therefore necessary for the engineer and architect to take things as he finds them and to provide for eccentric loads. Several investigations of the subject have been conducted, and a very useful paper by Mr. J. M. MONCRIEFF, which expresses the present state of knowledge on "The practical column under central or eccentric loads," was read before the American Society of Civil Engineers. It was found in the course of the inquiry that a column showed higher strength when apparently loaded eccentrically than when loaded directly over the geometrical axis. Mr. MONCRIEFF in his paper endeavours to explain the cause of the anomaly and to deduce new formulæ which would meet varied conditions in practice. Several varieties of columns are dealt with and elaborate diagrams are given showing the application of loads under various circumstances. The curves in them, he says, follow definite laws, and the author adheres to them in his own practice. He has not much faith in the old formulæ, for he says, "It is surprising to think of the enormous number of cast-iron columns which have been put into use without any justification for the loads imposed on them, except a simple faith in HODGKINSON's, GORDON's and RANKINE's formulæ, and in the numerous tables calculated therefrom and published in engineering pocket-books and treatises." In the discussion which followed the reading the majority of the members approved of Mr. MONCRIEFF's reasoning. One of the speakers mentioned the case of the Astoria Hotel, in which there are about 3,600 columns, each of which had to be especially taken into account. The statement is sufficient to suggest the care which is bestowed on designing the steel framing of American buildings.

THE late GODEFROID GUFFENS, who died a week ago in Brussels in his eighty-eighth year, must have had more experience as a mural painter than any other artist of the nineteenth century. From the character of his work his name did not often appear in the catalogues of exhibitions of easel pictures, and he was consequently less generally known as a painter than many inferior artists. For a long time M. SWERTZ was associated with him, and it was difficult to distinguish between their works. His paintings are to be seen in the council chambers of several of the old town halls of Belgium. In *The Architect* illustrations have appeared of his *Entry of Philip the Bold, The Departure of Godfrey of Bouillon and the Crusaders; Europe, Asia, Africa and America*, besides some of his paintings from the walls of churches and the remarkable series which illustrated the history of one of the old families of Antwerp. His works were characterised by careful drawing and archæological accuracy, with the quiet colouring which is necessary in architectural decoration. There was no affectation of archaicism. M. GUFFENS was the last of a band of painters who helped to restore Flemish art to its ancient level.

It is considered desirable to raise the sum of 10,000*l.* in order to restore the abbey church of Malmesbury, a building which has much interest in the ecclesiastical history of England. It is supposed there was a town there before the Roman invasion, and when the foreigners attacked it the castle was allowed to remain. A monastery is said to have been founded by a hermit called MALDULPH, and Malmesbury is thought to have been a corruption of Maldulph's Bury. ALDHELM presided over the school in the reign of ATHELSTAN, and the king granted a charter and many other gifts to the town. The Saxon basilica existed until the time of the Norman Conquest. The nave of the Norman church was erected between 1140 and 1160, and the building was described by LEYLAND as "a right magnificent thing." Originally it was a cross-church, but the central tower had fallen before LEYLAND saw the abbey. Norman, Early English and Decorated are represented in the building. The nave is now used as the parish church. The Bishop of BRISTOL says that when he went there its condition caused him great anxiety. The flying buttresses and parapets were actively dangerous, and there were grave fears lest a double buttress at the south-west point should give way, in which case the singularly noble south porch would have been destroyed. By great exertions the people in and near Malmesbury have raised between 3,000*l.* and 4,000*l.*, and this has enabled the authorities to make safe almost the whole of the six bays used as the church. But much is needed beyond barely making safe; and the more ruined parts of the old building cry out for attention. Hence the appeal for additional funds. The church was purchased by the parishioners of the neighbouring St. Paul's parish at the time of the Dissolution, when the Abbey buildings were converted into a cloth factory. WILLIAM of Malmesbury, the Mediæval historian, was librarian of the Abbey in the twelfth century, and might have been abbot if he had cared to assume the responsibility of the office. He claimed that he was an eye-witness of many of the scenes he described, and for others depended on trustworthy witnesses. For what occurred before his time he could only depend on other writers.

## ILLUSTRATIONS.

CATHEDRAL SERIES.—CHICHESTER: VIEW FROM NORTH-EAST.

THE HORNIMAN FREE MUSEUM: EXTERIOR, FROM CORNER OF ELLIOTT BANK. SOUTH GALLERY. ARCADE BETWEEN THE NORTH AND SOUTH GALLERIES.

THIS building was lately presented to the London County Council for the benefit of the inhabitants of the Metropolis. The contents are varied, and are likely to excite much interest among the humbler classes of students. Mr. HARRISON TOWNSEND has in his building realised the intentions of the donor.

STAINED GLASS IN ENGLAND SINCE THE  
GOTHIC REVIVAL.

By T. FRANCIS BUMPUS,

Author of "Ecclesiologia Germanica," "Summer Holidays  
among French Cathedrals," &c.A BRIEF REVIEW OF ECCLESIOLOGICAL  
PROGRESS, 1855 TO 1875.

(Continued from page 11.)

FROM the adornment of the altar with sculptured and painted imagery, we pass by an easy transition to a brief consideration of its apparelling and that of the ministers thereat.\* The revival of ecclesiastical needlework's true principles was entrusted in the first instance to a small band of ladies, among whom may be named the Misses Blencowe and Gresley and Miss Street, whose accomplished brother, himself no mean authority on the subject, if we are to judge from a most learned and interesting paper on Mediæval embroidery read by him before the Durham Architectural Society in 1863, directed their essays in the art. Latterly the preparation and embroidery of altar frontals, hangings and priestly vestments have been pursued by those "church-furnishing" houses which owe their existence to more than one eminent architect; by ladies in their own homes; and in the numerous conventual houses in which the Anglo-Catholic Church is nowadays fully as rich as the Roman. At the outset the needles of the Ladies' Ecclesiastical Embroidery Society were chiefly confined to altar frontals, among the earliest specimens of its handiwork being the antependia in Ely, Peterborough and Hereford Cathedrals, the crimson one still in use at St. Paul's at Whitsuntide and upon the Festivals of Martyrs, and designed by Mr. Bodley, while others were worked for St. Gregory's, Norwich; St. Ethelburga's, Bishopsgate; Chelonger Church, Herefordshire; Wantage Church, Berkshire; Bisley Church, Gloucestershire; St. John's, Leenside, Nottingham; All Saints, Boyne Hill; West Torrington Church, Lincolnshire, and many others—it being found difficult, from paucity of workers, to keep pace with the demand.

With the development of Ritualism before the sixties were far advanced, needlework began to find its expression in alms-bags, banners and stoles; in the vestment par excellence for the service of the altar, the chasuble; and in that stateliest of all ecclesiastical habiliments, the cope. The chasuble, probably from its sacrificial character, fell into desuetude during the Elizabethan period, but the use of the cope seems to have continued until the Puritan ascendancy. At Durham Cathedral in 1635 the service, according to Brereton's account (published by the Chetham Society) was performed with unusual solemnity. He says:—"The minster is kept as neatly as any in England. Therein is a stately pair of organs which look both into the church and chancel; a stately altar-stone, all of fine marble, standing upon a frame of marble columns. When the Communion is here administered, which is by the bishop himself, there is laid upon the altar a stately cloth of gold. The bishop useth the new red embroidered cope, which is wrought full of stars, like one I have seen used in St. Denis, in France. There are here two other rich copes, all of which are shaped like unto long cloaks reaching down to the ground, and which have round capes." This is one of numerous references to the use of copes in the seventeenth century. When something like order was brought back to our cathedrals and churches at the Restoration, Bishop Cosin, who was set over the diocese of Durham, determined, as far as lay in his power, to revive the ancient glories of that noble church, and, probably in grateful recollection of that prelate, the services at Durham were carried out in the laxest times of the eighteenth and nineteenth centuries with more than ordinary decorum. The vestments now preserved in the cathedral library at Durham were worn till they were so worn out as to be unfit for use, and appear to have been given up solely

on this ground—unless, indeed, a story given in the *Quarterly Review* for 1825 be true (as there is no doubt it is). The writer of the article, questioning the verger in attendance relative to the copes and their disuse, received the following reply:—"It happened in my time; did you ever hear of Dr. Warburton, sir?—A very hot man he was, sir. We never could please him putting on his robes. The stiff high collar used to ruffle his full-bottomed wig; till one day he threw the robe off in a great passion, and said he never would wear it again, and he never did; and the other gentlemen soon left off theirs too." This was in 1759.

Of late years the proper insignia of the episcopal office—the cope, mitre and pastoral staff—have been resumed by a large proportion of the English bishops. At St. Paul's Cathedral it is now the custom on the great Festivals of the Church for the dean and canons residentiary to appear in the handsome copes worn by them at Her late Majesty's Diamond Jubilee service, the minor canon, whose duty it is to celebrate the Holy Communion, being similarly vested. Perhaps this may be taken as a preliminary step towards the introduction of the proper Eucharistic vestments at St. Paul's—the chasuble for the celebrant, the dalmatic and tunicle for the assistant ministers. The cope is a most stately vestment, but more appropriate for choir offices and for processions than the altar service, from its voluminousness when performing the manual acts.

When the ceremonial revival in the Church of England first began, sixty years ago, the attention of the clergy had not been specially directed to the old English "uses," consequently the Latin sequence of colours—white, red, green, violet and black\*—was all but universally adopted for the altar frontals in churches where, ecclesiological principles having taken root, sets proper for the various seasons of the ecclesiastical year were provided. Of late years a more extended knowledge of English archaeology, combined with æsthetic good taste, has caused the vestments of the altar and its ministrants in an increasing number of churches to be in accordance, as far as can be accurately ascertained, with the rites of Sarum, which in pre-Reformation times is supposed by ritualists—not the "ritualists" of vulgar everyday slang, be it noted—to have been pretty generally followed all over the South of England. But it seems difficult to draw any hard and fast line, seeing that in the appropriation of colours to particular feasts a large amount of *proprium sanctorum* was enjoyed by almost every English diocese.

What is called the "Sarum Use" prescribed red as the colour for altar frontals and vestments for Sunday during a greater part of the year, and it is not unreasonable to suppose that the almost universal employment of that colour for the altar-cloth in post-Reformation times, and even now in churches where a change is made only in Advent and Lent, is a survival of this custom.

\* WHITE, as significant of joy, thanksgiving, peace and purity, is the colour for Christmas to the octave of the Epiphany, Maundy Thursday, Easter to the octave of Ascension Day, Trinity Sunday, Corpus Christi (Thursday after Trinity Sunday), St. John Baptist's Day, Transfiguration of Our Lord (August 6), Feast of the Holy Name (August 7), St. Michael and All Angels, All Saints Day, and for all festivals of the Blessed Virgin Mary, apostles, confessors and virgins who were not martyrs; it is also the colour for the Feast of Dedication, for Harvest Thanksgiving, Confirmation, Solemnisation of Holy Matrimony, Burial of Infants and Young Persons, and Ordinations. VIOLET, the colour denoting seasons of penitence and of holy meditation, is used during Advent, from Septuagesima to the Wednesday in Holy Week, on Rogation Days (the Monday, Tuesday and Wednesday before Ascension Day), Ember Days (the Wednesday, Friday and Saturday after the first Sunday in Lent, after Whitsun Day, after Holy Cross Day (September 14), and after St. Lucy (December 13), on Holy Innocents Day (December 28), on the vigils of certain of the red-letter feasts and at the Burial of the Dead. RED, signifying the power of the Holy Ghost and the blood of those who laid down their lives for Our Lord and His Church, appears upon our altars and in the vestments of our ministers at Whitsuntide, St. Stephen, Invention of the Cross (May 3), Exaltation of the Cross (September 14), and upon festivals of apostles, evangelists and other holy men and women who were martyrs. GREEN forms the colour for a very large portion of the ecclesiastical year when no particular event is commemorated, i.e. from the day after Trinity Sunday to Advent; it is also used from the octave of the Epiphany to Septuagesima. The selection of this colour seems to have been dictated by the idea that when we have nothing to guide us we fall back upon nature. BLACK is used on one day only in the year—Good Friday.

\* It is not so very long ago that the appointments of the sanctuary of an English capitol church were immeasurably inferior to those of many a newly-erected district one. It is pleasant, however, to be able to state that all this is now changed, and that the most sacred portion of our cathedrals, almost without exception, is now a pattern for, instead of what it once was, a disgrace to the diocese.

To decide between the rival excellences of the Latin and Sarum sequences of colour and other ritual "uses" does not come within the scope of these papers. The former, from its greater simplicity and expressiveness, seems to be preferred by the major portion of English church-goers at the present day, while the more esoteric character of the latter commends it to students of art and archæology.

One of the earliest of the clergy to revive the use of the chasuble (c. 1850) was the late Rev. Thomas Chamberlain,

vicar of St. Thomas the Martyr, Oxford, to which benefice he was appointed in 1844. But an earlier instance of the resuscitation of that vestment, after a desuetude of three hundred years, is recorded in the *Parish Choir* of 1848, in an article describing the dedication festival at a country church. "To my surprise," says the writer of the article, "the officiating ministers were vested with habits prescribed by the rubric, which are the same as directed by Edward VI.'s first Book of Common Prayer, viz. 'white albes plain,' over which the

HIGH ALTAR AND REREDOS IN THE CHAPEL OF THE SISTERS HOUSE OF MERCY AT CLEWER.

(Henry Woodyer, Architect. Thos. Nicholls, Sculptor.)

The above has been selected as affording a good illustration of an English church altar and its appurtenances at the present day. From the needle of the inmates of this Conventual House much of the beautiful work which adorns the sanctuaries of our churches has emanated.

celebrant wore a white silk 'vestment,' and each of his associates a 'tunic.' During the later fifties the Eucharistic vestments were adopted at St. George's-in-the-East by the rector, Rev. Bryan King, their revival, together with sundry other points of ritual which nowadays are taken as matters of course in every well-ordered English church, contributing towards those shameful riots which were allowed by those who had the power to check them to continue for successive Sundays in 1859 and 1860.

With the fuller development of the ritual movement during the earlier sixties the use of the vestments was revived by several incumbents in London and the country, notably by Mr. Mackonochie at St. Alban's, Holborn; by Mr. Stuart at St. Mary Magdalene's, Munster Square; by Mr. Le Geyt at St. Matthias, Stoke Newington; by Mr. Rodwell at St. Ethelburga's, Bishopsgate; by Mr. Upton Richards at All Saints, Margaret Street; by Mr. Bradley Abbot at Christ Church, Clapham; by Mr. Lowder at St. Peter's, London Docks; by Mr. Bennett at St. John the Baptist's, Frome; by Mr. Macleod at St. John's, Harlow; and by Mr. Beanlands at St. Michael's, Brighton. It is not a little strange that at St. Barnabas, Pimlico—the pioneer church of the Anglican Revival—the Eucharistic vestments should have been adopted only within comparatively recent years.\*

The passing of the Public Worship Regulation Act in 1875 and other circumstances militated considerably against the wide-spread use of the chasuble in administering the Holy Communion, but under the tolerant sway of the present Archbishop of Canterbury—especially when filling the see of London—and other liberal-minded prelates, the revival of the distinctive Eucharistic dress has become wide-spread.† With it there has arisen a desire to return to the English Mediaeval form of the chasuble as seen on brasses and ancient painted glass. The shape should be that of the *Vesica Piscis*. It should hang down before and behind in long points, and be gathered up in a few graceful folds over the arms. Rich and pliant materials are requisite for the making of the chasuble; the orphreys assuming the Y shape from the shoulders, being, in cases where money can be expended upon them, worked by hand with appropriate devices or subjects; while under less favoured auspices appliqué work or plain velvet with a monogram at the meeting of the arms may be used with equally good effect. In some churches where circumstances preclude the introduction of vestments made of coloured materials plain linen ones are worn, with just a pattern in coloured stitch. Such a set of vestments was in use for some time at St. Matthias, Stoke Newington.

#### ADVERTISING DISFIGUREMENT AND LOCAL CONTROL.

THE following memorial from the National Society for Checking the Abuses of Public Advertising has been addressed to the President of the Local Government Board:—

"We desire respectfully to represent the expediency of legislation by which municipal authorities would be empowered to frame and enforce regulations for the control of advertising display in public places.

"In 1899 the Corporation of Edinburgh obtained by a private Act powers for this purpose. Since then many other municipal bodies which were promoting bills have inserted provisions, following more or less closely the lines of the Edinburgh scheme.

"The case of Dover is peculiarly interesting as an illustration of the absolute need of restrictive power. An American firm have erected, in positions which make them visible against the face of the cliffs, two huge boards, which, in the judgment of most observers, destroy the beauty of a scene of which every Englishman is proud. The firm in question, though requested by the Town Council, and by a 'deputation representing the London bill-posting interest,' refused to remove the erections.

"There is a general feeling that the absence of any restraint upon the power of individuals to assail the eyes of persons using public thoroughfares causes a grievous loss of comfort and of pleasure to the community.

"We respectfully urge that municipal bodies should have

general authority to frame suitable by-laws, and that they ought not to be put to the expense of promoting special private legislation for the purpose. We would, therefore, ask that the Government should either give facilities for the consideration of the Bill prepared by the Society for Checking the Abuses of Public Advertising, or should themselves introduce a measure dealing with the subject."

Among the 150 signatories to the memorial are:—The Archbishop of Canterbury, the Bishop of Winchester, the Bishop of Ely, the Bishop of Rochester, the Bishop of Peterborough, Dr. Chawner, Vice-Chancellor of the University of Cambridge; Dr. Fowler, Vice-Chancellor of the University of Oxford; Sir William R. Anson, M.P., Sir Michael Foster, M.P., the Master of Trinity College, Cambridge; the Headmaster of Eton, the Duke of Somerset, the Duke of Westminster, the Duke of Bedford, the Duke of Northumberland, the Marquis of Dufferin and Ava, Lord Stanhope, Lord Stamford, Sir John Stirling Maxwell, M.P., Mr. W. S. Caine, M.P., the Right Hon. W. E. H. Lecky, M.P., Mr. John Burns, M.P., L.C.C., Mr. Thos. Burt, M.P., the Lord Mayor of London, Mr. A. M. Torrance, chairman London County Council; Lord Monkswell, Sir Colin Scott Moncrieff, Sir Robert Hunter, Mr. Lionel Cust, Mr. Sidney Colvin, Sir Reginald Palgrave, Sir E. Maunde Thompson, Dr. E. Ray Lankester, Sir Charles Elliott, Sir John Watney, Mr. Alfred P. Graves, Sir Edward Fry, Lord Davey, Mr. Montague Crackanthorpe, K.C., Mr. W. P. Beale, K.C., Sir Frederick Pollock, Professor Foxwell, Lord Avebury, Lord Kelvin, Sir W. H. Preece, Sir W. MacCormac, Mr. and Mrs. Humphry Ward, Mr. Robert Bridges, Mr. George Meredith, Sir Edward J. Poynter, president of the Royal Academy; Mr. G. F. Watts, R.A., Mr. Alfred Waterhouse, R.A., Mr. T. G. Jackson, R.A., Mr. J. A. Fuller Maitland, Mr. Henry Arthur Jones, Mr. E. D. J. Wilson and Mr. T. C. Horsfall.

The reply of the Local Government Board was as follows:—

"Local Government Board, Whitehall, S.W.: June 18, 1901. Sir,—I am directed by the Local Government Board to state that your letter of the 27th ult., addressed to Mr. Balfour, together with the memorial referred to therein in favour of legislation for the purpose of enabling local authorities to make by-laws for the control of advertisements in public places, has been transmitted to the President. In reply I am directed to inform you that no promise can be given that the Government will initiate legislation on the subject. The subject, however, appears to be worthy of attention, and if in a future session a Bill is introduced into Parliament by a private member on behalf of the Society, the Government will carefully consider its provisions and will watch its progress with interest.—I am, Sir, &c., W. E. KNOLLYS, assistant secretary."

Mr. Richardson Evans, the honorary secretary, remarks on this correspondence:—

"Since the memorial was prepared the proprietors of the commodity advertised at Dover have courteously sought an opportunity of assuring us that, in deference to public feeling, they offered to remove the boards on condition that the Town Council compensated them for the bare cost of erection, and that they would before this have withdrawn them if they had any assurance that the site would not be used for others of a similar character. We have reason to hope that the clauses giving the Dover Town Council the necessary powers in such cases will not be opposed in the private bill committee of the House of Commons. They have already been approved by the Peers.

"In the separate recommendations by Lord Balfour of Burleigh attached to the final report of the Royal Commission on Local Taxation the Secretary for Scotland urges that 'large powers of taxation as well as other powers for the control of advertisements should be conferred on municipalities as a right properly belonging to the guardians of the beauty and dignity of thoroughfares and public places.' We regard this expression of opinion from so high an authority as most encouraging.

"Some of the business organisations which will be affected by the legislation we advocate have imputed to us intentions which we desire to disclaim. Let me repeat that we aim at no censorship on grounds of taste; at no prohibition of any particular type of bill or sheet. The only interference we contemplate on the part of municipalities or county councils with the display of posters or ordinary wall announcements would be a refusal to allow the use of hoardings or other erections on such a scale or in such positions as would be an unjustifiable impairment of the local amenities.

"We should expect that the municipal bodies, while still content to act only in deference to the well-ascertained views of the residents in the places affected, would take cognisance of many abuses which do not come under the head of 'advertising' in the stricter sense of the term. Sky signs, field boards, huge letters on house fronts, roofs and chimneys would claim attention so far as they may be of a nature which average local opinion, as constitutionally expressed in the council, condemns.

"The factors in determining the use made of statutory

\* They were introduced at Christmas 1879.

† According to a return published in 1896, the number of churches in which the Eucharistic vestments were worn in that year was 1,632. It has since been greatly exceeded.

powers would in brief be the character of the immediate locality as regards natural beauty, architectural interest, the sensibilities and the pursuits of those who would be subject to the display."

### EDUCATION IN ARCHITECTURE.

FOR discussion at the late Convention of the Architectural League of America, the committee on education propounded the following series of questions, each separate question being assigned to the special consideration of two or more clubs, and the conclusions reached by these clubs have been printed in the *American Architect*.

The discussion was opened by a paper in which Mr. C. Howard Walker considers the entire series of questions.

#### The Questions.

- 1a. What should be expected of a graduate from an architectural school when he begins office-work?
- b. What should the schools leave for the offices to teach?
2. Is it advisable that the architectural student devote the time necessary to obtain a so-called classical education as a foundation for refined culture and taste, or can the same refinement be gained by studies more closely allied to architecture?
- 3a. How much mathematical and engineering training should an architect have?
- b. Should design and construction be separated so as to train specialists in each of these lines?
4. Should school study of architectural design be limited to monumental problems?
- 5a. Should architectural design and study of historic styles follow and be based upon a knowledge of pure design?
- b. How can pure design be best studied?
6. To what extent and by what methods should an architect acquire a knowledge of the art industries allied to architecture?

#### The Discussion.

C. Howard Walker: There are two old Oriental proverbs of which I am rather fond. One is, "The strength of the pot begins in the clay." The other, "To the man with shoes all the world is covered with leather."

My answers are based somewhat on those proverbs.

(a) The object of a school is to produce architects or to train them. The training they receive as draughtsmen in a school is only an incidental part, therefore much the most important part of a graduate's attainments is not called upon for a very considerable time after he has entered an office, and may not be called upon until he starts for himself in his profession. The expectations for attainment from the office when he enters are slight and can be roughly stated as follows:—Good draughtsmanship, *i.e.* neatness, speed and knowledge of how to lay out  $\frac{1}{8}$ -inch,  $\frac{1}{4}$ -inch and  $\frac{3}{4}$ -inch scale-drawings. Knowledge of combinations of material and construction, and how to represent them, especially how materials should be assembled and their points of junction. Ability to use constructive formulas from books. Knowledge of the orders of architecture and especially a realising sense that these orders are so organised that fundamental changes in them produce architectural disease.

(b) Tradition of the office. The adaptation of ways and means. Eternal vigilance with both the contractor and the client. A high standard of integrity. This last might be begun in the schools.

2. Note my first proverb. It depends upon the individual, since some men can never obtain refinement and others cannot be prevented from obtaining it. The classical education is so closely interwoven with many of the studies allied to architecture that either leads to the other. They cannot be divorced. It is merely a question of the relation of time to be devoted to each, and that depends upon the man himself. In a general way I should say that an architectural student in the schools needs more direct teaching from instructors on the studies allied to architecture, and would depend for his classics on his knowledge of how to use books. If the question implies a knowledge of Latin and Greek, they are not necessary.

(3a) Enough to prevent him from originating absurd combinations of materials, and to enable him to comprehend where strains and stresses will occur, at what points to anticipate weakness, and when to economise strength under present conditions. No matter how thoroughly trained as a civil engineer an architect may be, few, if any, have enough constant calculations to make to trust their conclusions as anything more than approximate, and it is almost a duty to have their work gone over by a specialist.

(b) That comes naturally. The man falls into either class by predilection. Both classes should be trained.

(4) No. But the principal stress should be laid on monumental problems. Monumental design gives much that tends to restrain and better ordinary hack-work, while hack-work

gives absolutely nothing valuable to monumental work, unless it be an accommodation of ways and means. First-rate monumental work is as needful of conditions as is any other, but is devoid of the exaggeration of pettinesses. Teaching in hack-work is merely the encouragement of common sense, which should on general principles be taken for granted, however lacking a large proportion of the students may be in it. I suppose this question is aimed at the teaching of small-house designing, &c., and should say that very little of it was necessary in the schools. The office supplies it.

(5a) I see no reason why "pure" design, by which I understand the study of proportioning construction, solids and voids, devoid of ornament and dependent upon constructive requirements and materials, should not be carried on together. Every style was naked before it was clothed, and the transitions are instructive. The student who is brought up on a knowledge of disposition of masses needs as much training in beautifying those masses as the student who has a knowledge of style needs in adapting the styles. It is somewhat as if Sandow tried to make his own clothes, or a fop tried to make himself look like Sandow. Certainly, the constructive organism is the more important; but with students, analytical, subtle study of proportions is a late achievement, not an early one, and while the first year in school may have teaching in simple constructive proportions, little of value can be expected in the results, and if a knowledge of the styles and appreciation of the delights of cultured, *soigné*, accomplished work by the best men of all times is beld back from the student, he is lacking stimulus, encouragement and much of the joy of architecture. I see no reason why the two things cannot be taught together to the benefit of both.

(b) By comparison of problems the determining qualities of pure design affect both the reason and the eye. The reason, inasmuch as they must appear stable and must not violate the laws of gravity, and consequently must have symmetry. The eye, as they must be agreeable to it. Each person can judge as to how far the reason is satisfied, but there will be a vast difference of opinion in regard to the visual merit. A discrimination in this respect can only be cultivated by constant comparisons which can be obtained through problems. As architecture deals with solids, I am not at all sure that models would not be of great value, for while accomplished architects comprehend, or think they do, what the effect of masses will be as indicated on plans and elevations, the student is completely at sea on the subject. It is the most difficult thing to get him to think in the third dimension.

6. This hints at the old idea that crops up now and then, that an architectural student should be a competent bricklayer, should wipe plumbing joints, lay matched floors, forge joint-bolts, &c., in order to know how they should be done. If he wants to, let him. The kind of man who wants to do either has a deal of time on his hands or will never get beyond those details. Business is carried on (no matter how many lapses there may be) on the fundamental principle that good work and honesty are necessary for success—if it were not, there would be no good work—and the architect who spends a large part of his energies in making himself a searching committee for minor defects is bound to be in hot water all the time and get no better result, nor as good, as the one who insists upon the employment of men of reputation and insists that his specifications be followed. The harping critic immediately asks, "How does he know his specifications are followed?" He knows by the training he gets in a good office, by his constant connection with good work, and by his knowledge that any firm of reputation cannot afford to do bad work. No amount of time devoted to craftsmanship of his own hands will give him any more than an occasional advantage over the student who has devoted himself to the greater things in his profession, and this last student will whip him hands down in many other things. I notice the question says "art industries." Perhaps I have misconstrued it. It mentions decoration in all materials, and if wood and stone carving, &c., are implied, the more he can learn about these the better; the schools should teach something in regard to them, and if he is an artist he cannot keep his hands away from them, schools or no schools.

Mr. Brueggeman (for the St. Louis Architectural Club):—

The two questions, "What should be expected of a graduate of an architectural school when he begins office-work?" "What should schools leave for offices to teach?" to which an answer is attempted in the following paper, seem to hinge so much the one on the other as to make it impossible to answer the one without the other.

It is obvious that when we have outlined, as we shall try to do presently, what we expect a young graduate to be capable of on beginning office work, at the same time we must indicate what we do not expect him to be capable of until we have taught him.

It is evident that we cannot expect from a graduate, any more than from any other person, what he has not been taught, or, more strictly, what he has not learned; therefore we are in a manner compelled to bring into the subject what the teaching

of a graduate should have been during his college course. We assume as being conceded on all sides, and therefore as being outside the range of this discussion, that every architect should have a foundation of a liberal general education, whether he be a graduate of an architectural school or no. So we shall proceed to technical matters.

We believe it to be impossible to make courses in architectural schools, in the time that is generally devoted and may reasonably be expected to be devoted to them, comprehensive enough to turn out graduates proficient at draughting in all its branches, mechanical and artistic; at the same time proficient in the knowledge of architecture, its history, its design, and the arts indissolubly connected with it, and at the same time proficient in architectural engineering and all the practical constructional detail that is but imperfectly mastered and is being constantly revised during years of active professional work. It is to be deduced from this that if we intend the student to know something of all these things we do not, and cannot reasonably expect him to have such familiarity with them on entering an office as to go on in the practice of them with all the smoothness that is desirable in actual work.

We may assume it possible to have an architectural school with three courses embracing the three heads just previously outlined. A graduate from any one of these departments who had wisely chosen that most suited to his temperament and to his abilities might reasonably be expected to come into an architect's office able to give points all round in his special line of knowledge; to have gone beyond grounding and theory; in short, to have all the working smoothness of a practitioner, and to be a valuable man capable of earning a considerable salary, but he would not have as yet the education necessary for the making of an architect.

At the present date the graduate from an architectural school looks forward to being what is known as an "all round" architect, therefore we expect him not to have had a specialised course, but to have been grounded in all branches of architectural training. In this grounding it is possible to give more weight to one department than another, and this seems to be the kernel of the question before us. The question then is, What branches may be given less time to, in order that more attention may be paid to others? It seems to us that too much attention cannot be given to such departments as are not likely to be thoroughly and correctly looked after in the experience that comes to the graduate after he enters on office work.

Of architectural history the student is likely to get nothing in the office, of architectural design he will get some, and in time a great deal, but it will be given in the most unsystematic manner; we believe, therefore, that in those two branches the student should be thoroughly grounded in the school. In office-designing he sees the thing done, but most usually without a reason being offered; in the school he should be taught how to discover the reason, how to apply the principles governing design, so as to be able to work out for himself the general scheme, for in the office his mind is only too likely to be contracted to that small portion of the work that falls to his share.

Mechanical draughting is likely to form a large part of his immediate experience in the office, and that he will and must become proficient in in a very short time, so that in the school no special effort need be made in that direction. Freehand drawing, on the other hand, must be largely developed outside of office work. We expect a student from a school to be so grounded in this as to have all his natural ability well developed. Modelling, of course, should be part of his training to that end. The student who has not spent considerable time in thus educating the hand, has, at the same time, not had his eye educated for the appreciation of form and proportion. He sees without accuracy and too often fails to see at all. In the office there is but little time for this training, so the graduate should be expected to be proficient here on beginning work.

In considering what should be expected of the graduate in the way of construction and constructional detail, it is necessary to be rather nice in making a statement. There are certain lines of architectural construction which have gone quite over to the specialist—the architectural engineer. The steel skeleton for the high building, the steel truss and some of the more complicated forms of built columns and girders lie properly with him.

We still have a grip on wood trusses, girders, posts, &c., and on all forms of construction in stone and brick, and we should expect the graduate to have explored the theory of construction and to have knowledge of the strength and possibilities of these materials as well as of steel and iron in their simple constructional shapes. When it comes to the detail of construction a very general knowledge only should be expected. The student has been trained to understand general principles which will enable him quickly to follow the office practice in detail making. It would be idle for an architect to expect a graduate to be educated up to his special idea of the correct form of window-box or wood gutter. So he expects him to come with his mind open in that respect.

It is impossible to give answers to the questions under consideration that cover the ground from all points of view. In the large office one thing is looked for, and in the small office something quite different. The graduate who enters an office should be expected to know something about the class of work likely to be done there. In the large office a more general knowledge should suffice; in the small office he should have given more thought to work such as frame houses, but right here comes up a point we wish strongly to insist upon; to a great degree architects and draughtsmen are of one of two classes—the first, designers with a general knowledge of construction; the second, constructionists and practical men with a general knowledge of design.

The architectural student early in his college course must discover to which class he leans, and take up with most care the studies in that class. Having done so up to the time of graduation, he must then look for a position where one of his class is desired. Then we believe that what should be expected of him is something very likely to be fully realised.

Professor White (this paper was prepared by graduates of the University of Illinois):—

"Should design and construction be separated so as to train specialists in each of these lines?"

"Should design and construction be separated so as to train specialists in each of these lines?" is a question on which I have often talked with the younger draughtsmen, and with each year's added experience come more and more to the conclusion that they should receive equal consideration in a college training.

Rarely, if ever, is a student capable of selecting his specialty. More frequently the outside world realises the strong points of a young man sooner than he himself.

When he has completed his college course and entered the world to take up his life's work he will be compelled to accept whatever work he can find in an office, and the first few years will be somewhat of an experiment until he has acquired at least a little practical experience. Circumstances often determine which line of work he will first be called upon to do, and if he is equally well trained in both design and construction he will be able to work intelligently until the opportunity presents itself for him to demonstrate to which line of work he is best adapted.

More frequently the employer discovers these facts before the young man does.

I often hear the point raised that design should receive the most attention in school, inasmuch as the construction which the average architect comes in contact with can be acquired in an office with a certain amount of outside study and observation, and that design is rarely ever taught in an office, as an architect generally settles on the points of design before it gets into the hands of the draughtsmen, and what then remains to be done is to put in shape the working drawings which, in a greater part is construction, and in this an architect is more capable of instructing his draughtsmen.

If a young man has no other ambition than to always be a draughtsman, there might be some excuse for his studying along special lines, although it would be much more difficult for him to advance in his early experience; but if he has ambition to become a practising architect it is very necessary that he have an all-round college training, in order to settle the many questions which come up in an ordinary practice.

It has been said, and rightfully said, that if the enthusiastic youths who have returned from Paris had paid a trifle more attention to construction their designs would be on a much higher plane than some of the recent fads in which construction is almost completely ignored.

A good design should express the purpose of the building and conform to the practical requirements of its needs, and if it fails to express a simple and rational construction it fails of its purpose as a design. I do not wish to imply that the designers should be able to master every part of the many difficult problems in construction, but I am convinced in my own mind that as far as a college training goes, it should be along a broad line tending more to train a young man to think for himself than to specialise.

Mr. William Rae (for the Toronto Architectural Eighteen Club):—

"How much mathematical and engineering training should an architect have?"

"Should design and construction be separated so as to train specialists in each of these lines?"

(a) An architect should have as much mathematical and engineering training as will enable him to solve, by means of formulas derived from the experimental research of scientific experts, every problem the erection of a modern building may involve in the safe and economical use of the materials of its construction, including steel construction, heating, lighting, ventilation and sanitation.

In considering this question we have borne in mind the difference between education and merely a knowledge of the expedients of modern practice, for these expedients vary so

much in different localities, and change so from time to time, so many men devising their own and ever learning fresh ones, that we think no rule may be laid down concerning them.

The use of formulas and tables thus derived we think one of the most justifiable expedients of modern practice.

The architect's work is the harmonious association of all the crafts, which harmony can only be considered complete when the possibilities of each craft in relation to the whole are perfectly developed, and to do this a knowledge of the nature and functions of every material used is necessary.

(b) Design and construction should not be separated so as to train specialists in each of these lines, because a specialist is one who, in addition to the ordinary knowledge of his craft, acquires a special knowledge of one line, not one who has acquired a knowledge of one line only of the general knowledge of his craft.

Design in architecture is surely, as seen in the study of the highest design, the human figure, constructing beautifully. Certainly the most intellectual part of the æsthetic satisfaction derived from the contemplation of the human figure comes from the perception of the harmonious grace of its constructional requirements.

Could we imagine a figure built up of compression-members covered with tension-members and concealed beneath a coat of ornament?

What we understand by architectural design has to be based upon the use of some material; to what material shall we limit it? Stone and wood only? We do not know what the material of the future may be; there may be no stone or wood. Times change, and we must change with them.

If to build with steel construction is engineering only, then to cover this construction with an architecturally ornamental plaster is decoration only.

Though the expedients of modern practice may involve the use of specialists, we must consider it as an expedient only. The architect is the opposite of a specialist.

Julius F. Harder (for the Architectural League of New York):—

"Should school study of architectural design be limited to monumental problems?"

"Should architectural design and the study of historic styles follow and be based upon a knowledge of pure design?"

"How can pure design be best studied?"

No reason can exist why general study of any art or science should be restricted to any branch or division of it, and, more particularly, not to an unusual and ideal one. Nor is this the case, so far as we know, anywhere in any school. The remedy, if there be any necessary, would be, that instead of architectural design being limited to monumental problems, it is advisable to limit the school of architecture design in monumental problems in so far as it causes a sacrifice of time and attention necessary to the acquirement of information, not so pleasantly monumental, but absolutely imperative to professional practice.

The "historic styles" should be studied as solutions of the problems which were presented by them in their time. It is a fact that too much stress is laid upon this matter. It is of very secondary importance. It is the most serious blunder of the schools that the "historic styles" are impressed as of primary importance. The schools are the only influence in the architectural life of to-day which seek to keep these ghosts imbued with artificial life.

Were America free from influence of foreign schools, the conviction is forced home to us, that by this time its people would have made more progress in substantial architecture. All in all, the results might not have been better, but upon the other hand they could not have been worse or more enslaving and retarding in effect.

This is proved by the universal progress which is recorded in all departments in which "schools" have not existed, and consequently have not interfered. The shortcomings, however, are not those of architecture or of archæology, nor is this an argument against schools, but the art of education itself is only in a formative state and but recently has itself become progressive and self-reformatory.

We would much prefer to go to the root of the whole matter and discuss the queries:—"Of what does architectural education consist? How can it best be imparted to the student?" The root answer to both would be:—"Hereditary disposition on the part of the student, his physical and mental fitness, sympathetic environment." Here we have the school, the system of imparting knowledge, the methods of acquisition, the subject, the materials and the object all combined. The school, the student and the course are but details growing out of this general proposition. The profession of education reaching out to inform itself as to its own functions, looking for light that it may behold the fruition of its own ends, asks itself first of all:—"Of what does any kind of education consist? How can the various kinds be imparted to the various individualities of students?"

The problem of architectural-school education applies

equally, although with less force perhaps, to other educational departments. In the sciences and in law, for instance, definite and absolute quantities and propositions are dealt with, whereas in architectural art we may only say of what it has consisted in the past, and admit with more or less reluctance that the materials, the methods and the forms and organisation of modern life make the imitation of the real art of the past but the mockery of the present. We testify to lack of knowledge and inspiration, to wrong analysis, to an education which is worse than none at all, by dogmatic insistence that the triumphs of the past must contain the solution of the new problems of to-day. It is all very well to make demands upon the schools. The school itself must have opportunity for healthful life, its own disposition, its own environment. The hereditary disposition of the American school must be the spirit of American institutions and American inventiveness and progressiveness. Its environment must be one free from influences beyond its own, of spectres and of shadows. Its equipment must consist of an understanding that there are real modern problems of architectural necessity to be met with real modern materials as evolved by modern knowledge.

Finally. In order that an art school may create its own atmosphere, fulfil its purpose, contain in itself an inspiration and an incentive to work and study, all the various art branches of the colleges and universities of the country should be detached from other branches of study and be amalgamated in one American art school, thus gaining in scale, volume, influence and effect through concentration and through singleness of purpose.

Answering the final question, then, under these conditions only "can pure design be best studied." Given now a buoyant and vigorous American student body, under the tutelage of independent and progressive men, and who shall say what are the restrictions set upon the American architectural art of the future?

Respectfully submitted,

The Architectural League of New York, by committee.

W. E. STONE,  
F. S. LAMB,  
J. F. HARDER.

Mr. Watterson (for the Cleveland Architectural Club):—

"Should school study of architectural design be limited to monumental problems?"

If this question means that the student's time should be divided between constructive work and monumental problems, it is one thing, and if it means that his time should be divided between "the theory of design" and monumental problems, it is quite another. The prime object of all education is to fit the student to cope with the problems of his profession in a masterful way. The prime object of an architectural training is to fit the student to be a successful architect in all that the word implies, but it is not at all to the point that he shall become an expert engineer. "At the same time it should be remembered that it is the intent of architecture to beautify structural forms. Consequently, a knowledge of structural forms cannot be ignored."

Modern construction calls for an unusual condition in design and makes it possible for the untrained mind to do seemingly impossible things, things which the trained mind would utilise to develop proper legitimate design. Mr. Marshall says in an article on the "Education of an Architect," which appeared in the *Record*:—

"It is evident, then, that we must teach our architectural student most emphatically to work in structural forms, but it seems to me equally true that in the education of the architect we should follow the developments of the past, i.e. that we should endeavour to teach the youth the principles of beauty and how to apply them to structural forms which are already settled and commonplace to the race as a race of builders. It were well, as I have said before, to make the education of the architect as wide as possible in every direction, for the broader the man the more effective will be his work so long as his dominant artistic impulse is left full play; but there seems no reason to insist upon the attainment of knowledge of highly technical engineering methods which are useful only in the solution of new structural problems, although it would, of course, be desirable, if possible, for the architect to gain the acquaintance of such methods. Of course, he should know thoroughly the underlying principles of engineering method, the way in which the strength of materials and foundation values are developed, and the most practical forms of construction in stone and brick, wood and iron, especial attention being given to the nature of arch-thrusts, and he should be able to work out the less-complicated problems in each case, but beyond this, all that he needs to know are the general forms within which he may work economically."

Now, on the other hand, it is a choice between monumental problems or the study of the "theory of design," and it would seem that, inferentially, the training in monumental work would so familiarise the mind of the student with the principles of good design that he could easily meet the requirements of any other composition.

It has been said that "the student is fortunate if his school-training gives him even a beginning of a sense of appreciation of what constitutes good taste." It is essential that the architect, to do good work, must be thoroughly grounded in the rudiments of design, and the student should be taught his design as the child is taught his alphabet. He should learn to use his mouldings, his surfaces, and his openings as a child is taught to use his letters in the formation of words, and words in the construction of sentences. If monumental problems embrace a greater number of the principles of design than other problems which are given to the student, then instruction should be limited to the monumental, but it would seem that the mind which had been taught to skilfully handle a composition which embodied the heavier principles, might easily express itself in any style, the principles being the same, the difference being in the manner of expression.

It is the duty of instruction to place high value upon the spirit of design, and it is for those who have in hand the education of the younger generation of architects to determine what method is best. The student should be taught to think inductively that his individuality may be expressed in his work. Just the best method to accomplish this end depends largely upon the attitude of the student, but it would seem that the mind trained upon monumental work and filled with the traditions of the best historic work would put into his problems an interpretation which generally would be correct.

Naturally, from the diversity of human ability, all students trained under the latter system may not become successful practitioners or draughtsmen, but with proper administration in the hands of capable instructors this system should produce many successes and few failures.

G. B. Page (for the T-Square Club) :—

"Is it advisable that the architectural student devote the time necessary to obtain a so-called classical education as a foundation for refined culture and taste, or can the same refinement be gained by studies more closely allied to architecture?"

"Should architectural design be based on a knowledge of pure design?"

"How can pure design be best studied?"

Assuming that is to be meant by a "classical education" the regular arts course of the Universities, it is advisable, because a classical education forms a good foundation to build upon in after life; advisable, however, only if a post-graduate course in some recognised school of architecture is to follow. The refined culture and taste so gained can hardly be obtained by other means.

Pure design being the logical solution of a given problem, it must follow that the architectural styles of the past are of their day and generation only. They may be studied as stepping-stones to the development of modern architecture, though no contemporaneous problem can be solved without meeting modern requirements in a modern way.

Pure designs can best be studied by an unbiassed consideration of all the diverse conditions entering into a problem; thus the dominant conditions will then govern the character and expression of the design.

Mr. J. W. Case (for the Detroit Architectural Club):—

"What should be expected of a graduate from an architectural school when he begins office-work?"

"What should the schools leave for the office to teach?"

On entering an office after pursuing a course of study in an architectural school, the student should be prepared to execute simple office work under the direction of an older man, so that he will be of immediate use and value in an architect's office. Besides this he should understand all the general principles of all branches of an architect's practice, so that he may quickly learn the office methods of applying this fundamental knowledge.

The school should teach general principles; the office should teach the technical application of these general principles.

In a four years' course of architecture there can be no time for specialties. The time is all too short to cover the general knowledge required in all the different branches of an architect's practice.

The student should not find that an excessive amount of his school-time has been taken up in studying monumental problems, whereas in his entire future practice he may never have a monumental problem to solve.

He should not find that an excessive amount of his time has been occupied by historical research, taking in consideration of those principles which would enable him to design architectural forms suited to his own surroundings, and making of him an archaeologist, capable of reproducing historical forms, but unable to design new forms suited to his own atmosphere, material and indigenous conditions.

He should not find that an excessive amount of his time has been occupied in perfecting methods of making pictures, which his defective knowledge of constructional forms renders him incapable of constructing.

He should not find that he has given so much time to the

study of applied mechanics and its application to architectural engineering, that he is deficient in artistic qualities.

When a student enters an office, he very often finds that his study has been biased by one or another of the above points of view, and also that he has not made an adequate study of the arts and crafts, or, in other words, that he does not know anything about the artistic uses of building materials.

The superior knowledge of the artistic possibilities of building materials marks the greatest epochs in architectural history. It is the basic principle, the vital and essential quality of Grecian and Gothic architecture.

The artistic chisel, feeling the firm and homogeneous pentic marble, brought forth those subtle curving forms and refinement of proportions which constitute the greatness of Grecian architecture.

The character of building material forced the architect to invent the arch, and the vault and buttress, and atmospheric conditions produced Gothic masses silhouetted against the sky.

The Japanese carver studies the grain of his wood, and from its twistings evolves the creatures of his imagination.

What does the American architect know of the artistic possibilities of building material or wish to know?

The student who is expected to understand all the fundamental principles of an architect's future practice will study the subject from three general points of view. As an artist, he will study drawing in charcoal, pencil, pen, brush with colour, modelling in clay, terra-cotta, cement, metal-castings, carving in stone and wood. Designing, both applied colour and form, and imbued coloured material, stained glass, wrought-iron, intarsia, &c. Ornament, historical and creative, based on native flora and fauna.

Architectural design, not only monumental problems, but artistic solutions of practical problems.

History of art, architecture, sculpture and painting as the development of principles.

Building materials, development of their artistic possibilities.

As a construction, the student will understand the general principles of building materials; of wood, masonry and steel constructions and their superintendence.

Laboratory work should supplement the abstract consideration of building materials. The student should pursue courses of shopwork in carpentry, masonry, metal, and spend considerable time in watching building operations.

It might be advised, before allowing an architect to practice, to require him to pass a certain amount of time as clerk of works; the gain to himself, to his client and to the future of American architecture would be enormous.

As a business man, the student should study specifications, contracts and civil law relating to building contracts and operations.

The school should teach all the fundamental principles which will control the architect in his practice.

The office should teach the practical methods of applying these fundamental principles.

The time of the student should not be taken up in perfecting the practical application of any of these studies of rendering; too much time is taken up in learning to make perfectly graded washes.

Beautifully-rendered drawings are an important factor in competitions, but are properly the work of a specialist.

The study of metal construction should embody principles and methods, and leave abstruse mathematical calculation to the specialist. The application of applied mechanics is the work of a specialist. Post-graduate courses should be arranged to meet the requirements of specialists. The school must form and direct the artistic tendencies of the student, and to that end the study of classical problems in architectural design is advisable, but the study of design should not be restricted to ideal classic or monumental subjects.

A majority or more of the students of architectural schools will devote their entire efforts in their practice to solving the requirements of ordinary commercial and domestic problems, and will never have an opportunity to design a monumental structure; students, therefore, should be instructed in the fundamental principles of the problems on which their entire future life will be passed.

They should understand the desirable arrangements and the conditions to be avoided in designing houses, commercial structures, churches, municipal buildings, schools, theatres, libraries, &c.

Their instruction should show them how to satisfy the practical conditions of ordinary problems in an æsthetic manner.

How can the solution of these practical problems be left for the office to teach? for it is generally conceded that the office solution of these problems is unsatisfactory.

For this end, the student must know building materials, how to use them practically and, especially, how to develop their æsthetic possibilities. He should understand and sympathise with the arts and crafts and receive instruction in modelling,

carving, stained glass, wrought-iron, &c., not to the extent of manual dexterity, but to gain a knowledge of æsthetic possibilities in using materials.

The most essential requirement of an architectural education is cultivation of the artistic creative faculty.

The creative faculty, the art instinct, the artistic imagination is the most valuable and most essential quality that the architect can have or acquire; it is the essential element in all great art. To awaken and develop this faculty is the greatest opportunity of the architectural school.

### LIVERPOOL CATHEDRAL.

A MEETING of the executive committee of the Liverpool Cathedral scheme was held on Monday. Sir William B. Forwood presided. It was reported that the contributions up to date amounted to 143,219*l.* 17*s.* 4*d.* The committee received a deputation consisting of Professor Simpson, Mr. Willink and Mr. Deacon, representing the Liverpool Architectural Society, who attended at the invitation of the cathedral committee to express the views of that Society with regard to the selection of an architect and the utilisation of the St. James's Mount site. Lord Derby has issued the following appeal for funds towards the carrying out of the scheme:—As chairman of the committee appointed at a public meeting held on June 17 in the Town Hall, Liverpool, to carry into effect the recommendation of the Bishop's committee as to the building of a cathedral, I make this appeal for your assistance. The promises of financial support which we have already received have been truly encouraging. The building and equipment of a cathedral is, however, a serious undertaking, and we cannot hope, nor indeed desire, that it should be accomplished by the means of contributions from a small number of persons, whatever their importance or wealth. The work would be deprived, indeed, of much of its value and interest were the cathedral to be the offering only of the few. It is to belong to all, and it must be built by all. Those who contribute, in however small degree, according to their means, should be able to feel that they can claim a personal interest in the cathedral work not inferior to that of contributors who have been able to give much. The question of the site has been definitely settled, so far as rests with the committee, by the adoption of the recommendation of the Bishop's committee in favour of St. James's Mount, and the City Council are being approached with a view to the purchase of this land. I address myself, therefore, with confidence to all connected with the diocese of Liverpool, and trust that they will unite with us in pressing forward the accomplishment of this good work.

### Ecole des Beaux-Arts.

SIR,—There is surely some error in your editorial in this week's *Architect* on the subject of M. Tony Garnier and the Académie des Beaux-Arts when you say, "He competed for the Prix de Rome and sent in drawings of a tabularium."

M. Tony Garnier won the Prix de Rome with a most able design in 1899, M. Sirot being second and M. Senès third. The subject, as given in the programme which I have by me, was for "Un Hôtel pour le Siège Central d'une Banque d'Etat." The winning of this prize carries with it certain conditions, just in similar manner as does the "Soane" with us, namely, the study of "antiquarianism," and if M. Garnier has devoted any of the time of his residence in Rome (at his country's expense) in any study or work other than the kind he was expected to do, I fail to see why we should quarrel with the Institute for reprimanding him.

I cannot help feeling sorry when I notice the evident desire on the part of English writers to belittle the French system of architectural training. Do they really know what it is, and what it has been the means of producing, or is it another proof of our chronic insularity? There is other Renaissance in the world besides the English, and at times we forget the fact. Our work would not be hurt did we sometimes flavour it with as much of the "Five Orders and the rules for mechanical proportion" as is to be found in the work of our French contemporaries.—Yours truly,

12 St. George's Crescent, Liverpool:

July 12, 1901.

JAS. H. COOK.

The London County Council has decided to send its tramway manager and also its electrical engineer to America, to find out the latest improvements and the best system of providing electric traction.

### GENERAL.

Mr. Val Prinsep, R.A., has undertaken to supervise the design of a brass tablet proposed to be placed in Battle Church as a memorial to the members of the Sussex Yeomanry who have died in South Africa.

His Majesty the King has been graciously pleased to confirm by Royal warrant the appointment of Messrs. Chubb & Son's Lock and Safe Company, Ltd., as lock and safe makers to His Majesty, thus continuing the Royal appointments which have been held by Messrs. Chubb since the year 1841 from H.R.H. the late Prince Albert, H.M. the late Queen Victoria, and H.R.H. the Prince of Wales.

The Chief Secretary to the Lord Lieutenant of Ireland has stated that the law officers of England and Ireland have met in consultation and advised the Treasury on the questions involved in the case of the Irish gold ornaments. The matter is now under the consideration of the Treasury.

It is Reported that in the course of the restoration work in the palace of the Duke of Massa-Carrara, there have been discovered two magnificent frescoes by Raphael. These frescoes fill two large spaces of the wall on which they have been disclosed.

The Church House, Westminster, has been enlarged at a cost of over 20,000*l.* There is a large library and a permanent hall for the House of Laymen, besides several other rooms.

The Westminster City Council have decided to undertake the widening of the Strand near Beaufort Buildings on the terms proposed by the County Council, who will contribute a sum of 50,000*l.* towards the cost. Further improvements are contemplated by the committee. The widening of Piccadilly near Hyde Park Corner will shortly be commenced.

The Stratford Town Council propose to spend a sum of 60,000*l.* on a new set of public baths. They will be on a grand scale, and will rank among the finest in the kingdom. The large bath will accommodate 500 bathers and 500 spectators. A site has been obtained in Romford Road.

Mr. Asquith has consented to open the exhibition of Chinese art at the Whitechapel Gallery on July 24. The attendance at the opening picture exhibition in the spring was so encouraging (205,000 in six weeks) that Canon Barnett and the trustees have decided to hold a series of exhibitions illustrating the arts and industries of various nations in the intervals between the picture exhibitions. The Chinese exhibition will be the first of these, and it will remain open until the beginning of September.

M. Batigny, architect at Lille, has been appointed correspondent in the section of Architecture of the Académie des Beaux-Arts in succession to the late M. Révoil.

The Statue of King Alfred by Mr. Hamo Thornycroft is to stand on a pedestal formed of two blocks of Cornish granite, each weighing about 80 tons, with a concrete platform beneath them.

M. Charles Normand, president of the Society of the Friends of Parisian Monuments, has called attention to the lamentable state of the Jewish cemetery of Prague, "one of the most precious monuments in the world," and to the danger menacing this famous piece of ground. He appeals to scholars and artists of every creed, as well as to Israelites everywhere, to save it from destruction.

Messrs. Farrow & Jackson, Ltd., have been appointed makers of cellar fittings to His Majesty the King, the like appointment having been held by them for many years to Her late Majesty Queen Victoria and also to His Majesty when Prince of Wales.

Belton Abbey, in Yorkshire, has been considerably spoiled by visitors, a fine piece of sculpture of much value having been removed last Sunday.

The British Museum has acquired by purchase the important collection of Gaulish and Merovingian antiquities formed by M. Léon Morel, of Rheims. Everything in the collection, from the Stone Age to the Merovingian period, was found in France.

Princess Henry of Battenberg, as Governor of the Isle of Wight, with a view to removing the misapprehension which has been caused by protests against certain innovations at Carisbrooke Castle and allegations of vandalism, has directed the publication of a memorandum. It states that all repairs and alterations at the castle are authorised by the Commissioners of Works, and no arrangements connected with the management of the castle or the grounds are made without the consent of, or for the purpose of carrying out suggestions made by the Royal Governor.

Mr. C. S. Morris, divisional surveyor to the West Riding of Yorkshire, has been appointed county surveyor of Northamptonshire at a salary of 350*l.* a year. There were 167 applications.

Mr. Edgar C. Thrupp announces that he has opened an office at 39 Victoria Street, S.W. where he proposes to practise as consulting engineer.

# THE Architect and Contract Reporter

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## ANSWERS TO CORRESPONDENTS.

H. N. B.—It seems to us after careful consideration that you cannot legally claim more than the scale charges of the R.I.B.A. unless you have a special agreement giving you such power and stipulating the fees you can charge.

## COMPETITIONS OPEN.

CHELSEA.—Oct. 1.—Competitive designs are invited for proposed new baths in King's Road, Chelsea. Premiums, 100 guineas, 50 guineas and 30 guineas respectively. Particulars at the office of the committee, 171 King's Road, Chelsea.

GUERNSEY.—Plans are invited for a primary school to be built at St. Peter Port, to accommodate 750 children, boys, girls and infants. Rev. G. E. Lee, rector, St. Peter Port.

MANCHESTER.—July 31.—Competitive drawings are invited for a fire station, a police station and other buildings, to be erected on land abutting upon London Road, Fairfield Street, Commerce Street and Whitworth Street, at a total cost not exceeding 85,000*l.* Premiums of 300*l.*, 200*l.* and 100*l.* Lithographed plan of site and copy of conditions may be obtained on application to the City Treasurer, Town Hall, Manchester.

PENZANCE.—Sept. 1.—Competitive plans and estimates are invited for laying-out ground situate on the Western Promenade, to include a winter garden suitable for band and other concerts, and lavatory accommodation for ladies and gentle-

men. Premiums of 21*l.* and 10*l.* 10*s.* respectively are offered for the best and second best designs. Mr. T. H. Cornish, town clerk, Public Buildings.

SHEFFIELD.—Aug. 31.—Plans and estimates are invited for the alteration of Eccleshall Church. The Rev. T. Houghton Eccleshall Vicarage, Sheffield.

TRURO.—July 20.—Applications are invited from competent engineers of special experience in works of interception and disposal of sewage, with a view to the preparation of a scheme for the disposal of the sewage of the city. Mr. Robert Dobell, town clerk, Truro.

## CONTRACTS OPEN.

ANDOVER.—For erection of three cottages and other works at New Street, Andover, Hants. Plans and specifications can be seen on application at 5 East Street, Andover.

ARGENTINE REPUBLIC.—December 10.—For construction of harbour works at Rosario. Particulars can be obtained at the Commercial Department Foreign Office, S.W., on personal application.

BATLEY.—July 22.—For alterations and painting, &c., to refreshment-room at the Princess Alice coffee tavern, Wilton Street. Mr. B. Watson, architect, Station Road, Batley.

BECKENHAM.—July 22.—For erection of a brick transformer station, 10 feet by 8 feet in size internally, in Durham Avenue, South Hill Park, Beckenham, the construction of foundations for a 15-ton weighbridge and the erection of an office, 10 feet by 8 feet, at the electric-lighting station, Arthur Road. Mr. John A. Angell, surveyor.

BEVERLEY.—July 31.—For repairs to the White Horse inn, Hengate. Mr. F. G. Hobson, clerk to St. Mary's Churchwardens, Newbegin, Beverley.

BIDEFORD.—July 25.—For erection of a school for girls and infants on the Geneva Place site. Messrs. R. T. Hookway & Son, architects, 12 Bridgeland Street, Bideford.

BIDEFORD.—July 25.—For alterations and additions to Rock House. Messrs. R. T. Hookway & Son, architects, 12 Bridgeland Street, Bideford.

BIRKENHEAD.—Aug. 3.—For erection of Board offices, &c., in Birkenhead. Mr. E. Kirby, architect, 5 Cook Street, Liverpool.

BLACKBURN.—July 22.—For extension of the electricity works, Jubilee Street. Mr. A. S. Giles, borough electrical engineer, Jubilee Street, Blackburn.

BURY.—July 30.—For extension of the engine and boiler-houses and other works at the electricity works, Rochdale Road, Bury, Lancs. Mr. Arthur W. Bradley, borough surveyor, Bury.

CATERHAM.—July 22.—For alterations and additions to the laundry at Caterham Asylum. Mr. T. Duncombe Mann, clerk, Asylums Board, Embankment.

CANNOCK.—July 30.—For erection of an infirmary at the workhouse at Cannock. Mr. Ashton Veall, architect, 84 Darlington Street, Wolverhampton.

CHAILEY.—Aug. 1.—For erection of an isolation hospital, caretaker's house and other works at Chailey, Sussex. Mr. Henry Card, 10 North Street, Lewes.

CHESTER.—Aug. 1.—For erection of a male epileptic ward for 50 patients, and a nurses' home, at the Parkside Asylum, Macclesfield. Mr. H. Beswick, county architect, Newgate Street, Chester.

CROYDON.—July 22.—For extending the flues and boiler settings at the Corporation electric-light station, Factory Lane. Mr. E. Mawdesley, town clerk, Town Hall, Croydon.

# STURTEVANT

SYSTEM OF

## Warming & Ventilating.

STURTEVANT ENGINEERING COMPANY, LD.,  
147 QUEEN VICTORIA STREET, LONDON.  
GLASGOW, PARIS, BERLIN, STOCKHOLM, MILAN, AMSTERDAM.

**DARLINGTON.**—For extending palisading and wall of churchyard of St. Cuthbert's Church. Messrs. Clark & Moscrop, architects, Darlington.

**DARTFORD.**—July 22.—For new sanitary and lavatory fittings and alterations to certain doors at the pavilion, and cleaning, distempering and painting work at the female attendants' home at Darenth Asylum, Dartford, Kent. Mr. T. Duncombe Mann, clerk to the Metropolitan Asylums Board, Embankment, E.C.

**DIDCOT.**—July 23.—For erection of a store-house, office, &c., at Didcot station, for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station, W.

**DUDLEY.**—July 22.—For erection of underground conveniences in Stone Street. Mr. John Gammage, borough surveyor, Town Hall, Dudley.

**FALMOUTH.**—July 27.—For erection of public sanitary conveniences in Kimberley Park. Mr. John H. Genn, town clerk, Municipal Buildings, Falmouth.

**FINCHAM.**—For erection of a Primitive Methodist school-room. Mr. T. H. Barker, Fincham.

**GRENDON.**—July 22.—For construction of latrines and other sanitary work at the school, Grendon Underwood. Mr. Fred Taylor, architect, 26 Temple Street, Aylesbury.

**HASSOCKS.**—For new drainage, latrine, &c., at Hassocks schools. Mr. Clayton Botham, architect, 128 Queen's Road, Brighton.

**HEMSWORTH.**—For erection of working-men's club at Hemsworth, near Wakefield. Mr. Walter E. Richardson, architect, Rothwell, Leeds.

**HEMSWORTH.**—For additions to the isolation hospital adjoining Brierley Common, consisting of new scarlet fever ward, porter's lodge, stabling, &c. Mr. Thomas Holliday Richardson, architect, Hemsworth, near Wakefield.

**HEREFORD.**—Aug. 1.—For erection of twenty-one cottages at the junction of St. Owen Street, Green Street and Mill Street. Mr. John Parker, city surveyor, Mansion House, Hereford.

**HULL.**—July 22.—For alterations and additions to three shops in Carlisle Street. Mr. John Watson, quantity surveyor, Cogan Chambers, Bowlalley Lane.

**HULL.**—July 25.—For erection of stables, loose-boxes, cart-sheds and offices in connection with coal depôts near Paragon

station, for the North-Eastern Railway Company. Mr. William Bell, the company's architect, York.

**IRELAND.**—July 22.—For erection of a residence for the sisters of mercy at the South Charitable Infirmary and County Hospital, Cork. Mr. James F. McMullen, architect, 30 South Mall, Cork.

**IRELAND.**—July 22.—For reconstruction of Ballyclare Unitarian church. Mr. James Ferguson, architect, 13 Union Street, Belfast.

**IRELAND.**—July 23.—For erection of a labourer's cottage and fencing plot at Ardee. Mr. Louis Tourley, engineer, 17 Laurence Street, Drogheda.

**IRELAND.**—July 24.—For seating new church at Gortin. Mr. E. J. Toye, architect, Strand, Londonderry.

**KEIGHLEY.**—July 22.—For erection of offices, showroom and workshops in Cook Lane. The Chairman of the Gas Committee, Gas Offices, Low Bridge.

**KINGSBURY.**—July 24.—For erection of schoolroom, offices and alterations to present buildings at the schools at The Hyde, N.W. Messrs. Hudson & Hunt, 40 Upper Baker Street, W.

**KING'S LYNN.**—Aug. 3.—For alterations and additions to the Naval Reserve public-house, St. Ann Street, Lynn. Mr. Herb. Tilson, architect, Railway Road, King's Lynn.

**KIRKBY LONSDALE.**—July 24.—For erection of two dwelling houses in Bective Road. Mr. John Hutton, architect, Kendal.

**LEAVESDEN.**—July 27.—For erection of a mortuary at Leavesden Asylum, near Watford. Mr. T. Duncombe Mann, clerk to the Metropolitan Asylums Board, Embankment, E.C.

**LEICESTER.**—July 25.—For erection of a five-storey goods warehouse, Sussex Street, Leicester, for the Midland Railway Company. Mr. Alexis E. Charles, secretary, Derby.

**LEICESTER.**—July 27.—For construction of removable gymnasium floor at the Bath Lane baths. Mr. Geo. E. Mawbey, borough surveyor, Town Hall, Leicester.

**LIVERPOOL.**—July 23.—For construction of a goods yard, roofing, offices, &c., and alterations to existing buildings at Wapping, Liverpool, for the Lancashire and Yorkshire Railway Co. Mr. R. C. Irwin, secretary, Hunt's Bank, Manchester.

## THE SUNBURY LINCRUSTA-WALTON WALL DECORATION.

YORK.—July 25.—For erection of lodge and discharging block at York Fever Hospital. Mr. Alfred Creer, city engineer, Guildhall, York.

EFFORTS are being made to induce the London County Council to include in its schemes for the regeneration of London the sweeping away of the Italian quarters behind the Italian Church, Hatton Garden, owing to the insanitary and dilapidated condition of the whole district. This agitation is supported by the Holborn Borough Council and many of the leading clergy.

WINCHES

The Machine is so named because of its adaptability as a means of lifting or lowering articles and materials of every kind with great despatch and safety.

By its use in Building operations ordinary Wheel-barrows, Hand-barrows, Baskets, Buckets, or other receptacle, being used, the loaded one ascends while the empty one descends, and at a great saving in the cost of labour.

## KODAK, LIMITED.

THIS company has just opened at 40 West Strand a new gallery very artistically arranged and decorated, in which they are showing a fine and very interesting collection of war pictures, sepia tinted enlargements by the bromide process from negatives taken by their various kodaks. Clearness of definition in a very high degree characterises all these pictures, which convey a thoroughly realistic idea, artistically treated, of various episodes in the war, and form a series of illustrated historical notes which will gain enhanced value with the lapse of time.

## ELECTRIC NOTES.

THE dedication of the new organ and electric installation at Dudley parish church took place on the 11th inst. In the installation of the electric light the illumination of the altar has received special treatment, and electric lights are placed behind the east window for displaying its exceptional beauty by night.

At a special meeting of Nairn Town Council notice was received from the Electric Supply Corporation, Ltd., intimating their intention of applying for a provisional order under the electric-lighting Acts for statutory powers within the burgh of Nairn. The Council unanimously agreed to consider this question of electric lighting early, and in the event of agreeing to introduce electric lighting they thought it would be more satisfactory to carry out the works themselves.

THE plans and specifications of a scheme for the electric lighting of Aston, Birmingham, will be ready to submit to the next meeting of the District Council. The provisional order was secured two years ago. The generating station will be at Chester Road, on the ground now occupied by the highways depot, for which another site has been secured. It is understood that the whole of the thoroughfares will be lighted, and the cost of the necessary buildings, mains, &c., is estimated to run into six figures.

AN important inquiry, which lasted between six and seven hours, was held at the Urban District Council offices, Surbiton Hill, on Tuesday, relative to the Council's application to the Local Government Board for sanction to borrow 50,000l. for purposes of electric lighting. The inspector was Colonel William R. Slacke, late of the Royal Engineers. Evidence was given on behalf of the scheme by several witnesses, and considerable opposition was raised to the whole scheme, it being contended that the electric light was not needed, and that the agreement with the company was really a transfer of the Council's powers. The inspector said if this were so the Council would have to go to the Board of Trade.

PREPARATIONS for the erection of the new electrical construction works for Messrs. Siemens & Co. at Stafford were commenced last week. Between thirty and forty workmen have been engaged in making excavations at the Queensville end of the site, and steps are being taken to clean out and extend the pool, which presumably will be utilised as a reservoir. It is on this part of the site that the railway sidings will be constructed, and the contract for the work, amounting to 1,300l., has been let to Mr. C. J. Nevitt, contractor, of

Stafford. The main siding will follow the line of the Lichfield Road, passing between the road and The Hough residence, and taking a curve towards the London and North-Western main line, with a branch leading to another portion of the proposed works.

A LOCAL Government Board inquiry has been held at Barrow in respect to an application by the Corporation to borrow the sum of 12,340*l* for the extension of the electric-lighting system to Vickerstown and Walney Island. There was no opposition. It was stated that 500 new houses had been completed at Vickerstown, and plans for 350 more had been passed, whilst Messrs. Vickers, Sons & Maxim are also going to build about 400 more. It had been decided to light the streets of Vickerstown with electricity, using 22 arc lights and approximately 100 incandescent lamps. Messrs. Vickers, Sons & Maxim had entered into an agreement with the Corporation in which they guaranteed that the revenue arising from the supply of electricity to the houses would mean not less than 1,000*l*. per annum for five years. This guarantee was exclusive of street lighting, the revenue from which would be about 600*l*. The supply of electricity to Barrow was only commenced in 1899, when there were 43 consumers, and now there are 192, and exclusive of Vickerstown there are 945 lamps awaiting connection.

COLONEL A. G. DURNFORD, R.E., an inspector of the Local Government Board, held an inquiry at Bath on the 27th ult. into the application of the Council to borrow 4,000*l*. for the purpose of extending the electric-light works. The property to be purchased adjoins the generation station, and the total area is 1,562 square yards. The application was made in consequence of increased trade, the city electrical engineer stating that the number of 8 candle-power lamps in use had increased from 17,802 at the end of 1898, to 31,360 to the end of May this year. The present area of the works is totally inadequate, and the new property will be used for extending the plant. Subsequently the inspector heard an application for powers to borrow 1,200*l*. for the purpose of street improvements.

THE Heriot-Watt College, Edinburgh, through Professor Bailey and Mr. A. S. Chalmers, one of its students, has just taken an important part in introducing to the very heart of Central Africa a supply of electric plant for lighting and power such as few civilised regions possess. Before Dr. Robert Laws passed through London recently with reinforcements for the Livingstonia Mission he arranged for this installation,

which is being prepared at a cost of 4,000*l*. partly in this country and partly in Switzerland. At present kerosene alone supplies light to the great industrial college and Scottish mission stations around the head of Lake Nyassa. The freight raises the cost of a half-crown's worth of the paraffin oil to thirty shillings. The light thus supplied to the native students and purchased by the Europeans at present represents the interest of 4,000*l*. This sum Mr. James Stevenson, of Glasgow, and others are supplying to send out Mr. A. S. Chalmers in a month or two with the electric plant. There is a fine water power on the high uplands above Florence Bay to generate electricity enough to supply 600 lamps of 6 candle-power each and to give power for motors to drive a brickmaking machine, a flour mill, a pneumatic hammer, an iron-turning lathe, wood-working machines and the printing press. Such is the scarcity of labour even at this source of its supply that all industrial progress might be arrested but for labour saving machines of the most advanced type. This electric installation and a supply of pure water, through steel pipes from Glasgow, costing a similar sum, presented by friends, promise to place Livingstonia Institution in North Rhodesia at the head of all industrial civilising agencies among the dark races of our Empire.

### BUILDING AND BUILDERS.

THE trustees of the Bethel Methodist New Connexion chapel, Failsworth, have decided to proceed with the erection of a new chapel on the site of the present one.

THE foundation-stones of an extension of the Sunday school premises at the Holywell Cross Primitive Methodist chapel, Chesterfield, were laid on the 10th inst. The new premises are to be attached to the existing building, providing ample classroom accommodation and an enlargement of the assembly-room. The cost of erecting and furnishing this building will be about 1,600*l*., exclusive of the cost of the site.

THE Nile reservoir works will probably be completed six months earlier than was thought possible when Sir John Aird entered into his contract with the Egyptian Government. During the present season 352,000 cubic yards of masonry have been constructed, and 32,600 tons of cement, all shipped from England, have been used in building up the dams at Assuan and Assiut; and it may be added that continuous employment has since last November been given to nearly

16,000 operatives, 90 per cent. of whom are Egyptians, the remainder being mainly British and Italians.

THE railway committee of the Paris Municipal Council has pronounced in favour of an application for leave to construct an underground railway from Montmartre to Montparnasse. The railway would have to pass under the Seine just below the Pont de la Concorde, and its depth underground would be from 26 to 120 feet. Under the Seine there would be two iron tubes of 17 feet diameter. The traction would be electric, the length would be four miles and the cost is estimated at 35,000,000 francs.

THE ancient church of St. Monan's, N.B., is undergoing careful restoration under the supervision of Mr. McGregor Campbell, of Glasgow. In every detail the antique character of the building is to be observed. A new roof of Caithness slates and ridge is being put on, granolithic in place of the old cement is laid on the tower, and a new session house will be built. An effort is also being made to protect the walls from damp, and when digging a trench the other day the men found the building stood on solid whinstone rock.

IT is expected that the new naval hospital which is being erected by contract at the north-east portion of the Royal Naval Barracks at Keyham will be ready for use in the early part of next year. It is intended for patients belonging to the naval dépôt at Devonport, and will not only be a great convenience as far as the medical work of the dépôt is concerned, but will afford a certain amount of relief to the present naval hospital at the western port, which is situated at Stonehouse. The new building at Keyham will provide accommodation for at least forty patients.

THE foundation-stone was laid on Monday of a chapel which is being erected at King's Norton to replace a wood and iron structure which has hitherto had to suffice for the Wesleyan mission established there some seven years since. Designed by Mr. Ewen Harper in the Tudor-Gothic style of architecture, with a handsome tower and spire, the chapel will be an ornament to the district. It is to be built of red brick with York stone dressings, and will consist of a nave and aisles divided by enriched granite columns. Immediate provision is to be made for 480 kneelings, and the plans permit of further accommodation being secured when necessary by the addition of transepts and a chancel. The main entrance is to face Middleton Hall Road, and the porch consists of a moulded stone archway with pinnacles and pediment. There is a second entrance from the front, in the tower, by which access

is gained to the gallery. The builders are Messrs. Harley & Son, of Smethwick.

A COMBINED effort is being made by the operative slaters throughout Yorkshire to obtain new rules applicable to the whole of the county, and an increase of wages. In Leeds at the present time the rate of pay is 9d. per hour, but in some other towns it is only 8½d., and the men ask that they should be paid at the rate of 9½d. per hour throughout Yorkshire. No alteration is suggested with regard to the working hours, which are fifty per week. The masters will meet in Leeds this week to consider the question. A private meeting of the Master Slaters' Association has been held, and from information then obtained it was decided to meet the officials of the Operative Slaters' Society to-morrow. The position is reported to be very acute. Certain proposals have been made by the masters for the men's consideration, and if these are not accepted there is great probability of a strike, which will affect the whole of the Yorkshire slaters.

THE annual general meeting of the South-Western Building Trades Employers' Federation was held at the Royal Hotel, Cardiff, on the 27th ult., under the presidency of Alderman H. J. Spiller, of Taunton. The secretary (Mr. A. E. Latham, of Bristol) read a most satisfactory half-yearly report. The meeting was asked to join with the executive in heartily congratulating Mr. A. Krauss, of Bristol, on his election to the presidency of the National Federation of Building Trade Employers of Great Britain and Ireland. The report stated that negotiations had been carried on with representatives of various South Wales Building Associations, and that these had resulted in the formation of a South Wales Building Trades Employers' Association, which would be worked in conjunction with the South-Western Federation. The Swansea strike was referred to, but as the matters in dispute were referred to arbitration the question was not discussed.

THE memorial-stone has been laid of a new fire-station to be erected by the Council in West End Lane, West Hampstead. It is to be built on land near the junction of West End Lane with Mill Lane and fronting the old village green of West End. It is in the centre of a district which a few years ago was nearly all open fields, but which is rapidly becoming covered with houses, and which is estimated in a few years' time to have a population of at least 200,000. The site cost 1,756l. 9s. 10d., and has an area of 16,000 square feet. The cost of the building will be about 11,373l. The plans contain several new features, such as the provision of an increased

number of sets of quarters for the firemen and their families. Four of the sets of quarters will take the form of separate cottages, each with its own garden, at the rear of the station proper. The whole of the premises will be lighted with electricity. In performing the ceremony of laying the stone, Mr. Gilbert explained that this new station formed part of a scheme decided upon by the Council for providing additional stations in various parts of the Metropolis, including West Hampstead, East Greenwich, Lee, South Battersea and High-bury.

SANCTION for the borrowing of the increased estimated amount for the conversion of St. Nicholas House, Scarborough, into new municipal offices has been received from the Local Government Board, and the work will now be proceeded with. It may be remembered that some two years ago the Corporation purchased the St. Nicholas House and gardens for 33,500*l*. The gardens having been converted into a public park, with terraced walks and shady nooks, were formally opened in August last by the then Lord Mayor of London (uncle to Mr. G. Lord Beeforth, J.P., an ex-mayor of Scarborough, and a greatly esteemed resident at the present time), but with regard to St. Nicholas House itself the Council decided to convert it into municipal buildings, so that all the Corporation offices could be combined under one roof. In 1899 estimates were prepared, and it was then thought that the cost of the conversion would be 14,000*l*., the sanction of the Local Government Board for the borrowing of this amount being obtained. When, however, the priced bills of quantities were prepared, it was discovered that the cost, instead of being 14,000*l*., would be nearer 20,000*l*., which gave rise to considerable opposition and delay. All difficulties have now, however, been overcome.

A MEETING of the heritors of the parish of Fyvie, Aberdeen, was held in the church on the 1st inst. to consider an application by Mr. A. J. Forbes-Leith to make structural alterations on the parish church at his own expense. The proposed alterations will be of rather an extensive and distinctly beauti-

fying character, and will provide an organ chamber and additional sitting accommodation. The parish church of Fyvie was built in 1808. It was renovated and decorated a few years ago, a stained-glass window being placed on each side of the pulpit—one window representing St. Paul preaching at Athens and the other illustrating the incident of the Brazen Serpent. The fittings of the church include a richly-carved communion table, a handsome pulpit and a tasteful font, all of dark polished oak. The organ is said to be one of the largest and handsomest in the country. There are a number of interesting mural tablets in the church, which also possesses some very old and perfectly unique communion plate.

THE foundation-stone laying of the London Baptist Association church and schools, Muswell Hill, N., took place on Wednesday, July 3. The seating accommodation of the church is for 900 persons. The ceiling is vaulted in wood-work. A bold tower terminated with a spirelet forms a prominent feature in front. The buildings are faced with red brick with Bath stone and Costessey dressings. The style of architecture adopted is Late Decorated Gothic. Messrs Mattock Bros.' (Wood Green, N.) tender of 6,408*l*. 16*s*. has been accepted for the work. The architects' estimate was 6,740*l*. The design was selected in a recent competition limited to six architects, the alternative designs by the same authors, "Greek Cross" and "Twentieth Century," being placed respectively first and second. The architects of selected design ("Greek Cross") are Messrs. George Baines, F.R.I.B.A., and Reginald P. Baines, 5 Clement's Inn, Strand, W.C.

## TRADE NOTES.

A LARGE clock has just been erected in St. Andrew's Church, Stockwell, which shows time on four dials and strikes the hours. The clock is generally to the designs of Lord Grimthorpe, and made by John Smith & Sons, Midland Clock Works, Derby.

MESSRS. HOBBS, HART & CO., LTD., are introducing under the name of "New Century Latches" some improvements in their well-known and already excellent night-latches. These locks contain all the elements of security without the complicated adjustments needed for fixing, common to most small-keyed locks. They are extremely neat in appearance, and are, moreover, distinctly moderate in price.

## VARIETIES

THE public slaughter-house, erected by the Town Council of the burgh of Denny and Dunipace, N.B., at a cost of 1,200*l.*, was opened on Tuesday afternoon. The architects (Messrs M'Luckie & Walker, of Stirling) presented the provost with a silver key.

LORD ESHER has informed the Secretary of the Society of Architects that the executive committee of the Queen Victoria Memorial see no reason to depart from their original decision, taken after careful and due deliberation, to confine the competition to five architects.

A NEW Kursaal which has been erected on the pier at Eastbourne from designs by Mr. Noel Ridley, was opened on the 15th inst. The new structure, together with the other improvements carried out simultaneously, has cost about 26,000*l.* The pavilion is built on the cantilever principle, so that there are no pillars to obstruct the view of the audience.

THE London County Council have expressed their willingness to effect the much-needed widening of Hampstead Road conditionally upon receiving a contribution from the St. Pancras Borough Council. The subject was before the latter Council on Wednesday last, when it was agreed to contribute to the extent of one-eighth of the cost. Now it rests entirely with the London County Council to take the necessary steps to immediately remove this dangerous obstruction of one of our busiest thoroughfares.

THE proposed new crematorium for London promises to be an extremely handsome building. It is to be erected at Finchley, about four miles from the Marble Arch, and will be the property of the company owning a similar building at Woking which has now reached the limit of its capacity. A feature of the new building is to be a fine cloister extending round the grounds to serve instead of a wall or fence. This is to be used for the storing of urns and the placing of memorial tablets.

THE Court of Assistants of the Worshipful Company of Makers of Playing Cards have awarded the prizes in the recent competition for the best design for the backs of playing cards in connection with this company; 323 designs were sent into the competition, and the prizes were awarded as follows:—The "H. D. Phillips" prize of 10*l.* 10*s.* to Mr. George D Drummond, Clifton Road, South Norwood; second prize of 5*l.* 5*s.* to Mr. H. W. Hardy, Featherstone Buildings, Holborn; third

prize of 3*l.* 3*s.* to Mr. E. F. Proctor, Brondlands Terrace, Clapham Common, and fourth prize to Mr. E. E. Middleton, Ellington Road, Aston, Birmingham. The designs of five competitors were highly commended.

WE have received from the Thornton-Pickard Manufacturing Company, Ltd., to the excellence of whose cameras and photographic appliances we have had several occasions to refer, their "Album of Prize Pictures," selected from subjects sent in for their 1900 competition. This album is large folio size, and contains twenty full-page reproductions of the subjects in question, which have been sent in from all parts and which fully maintain the high excellence which has characterised them in previous years. The company announce their 1901 competition, in which 105*l.* will be distributed as follows:—35*l.* will be given in prizes for the best sets of four instantaneous photographs of subjects of general interest. 35*l.* will be given in prizes for the best sets of four instantaneous photographs of quickly moving objects. 35*l.* will be given in prizes for the best sets of four photographs of any subjects of general interest either "instantaneous" or "time exposures."

AT a meeting of the Withington Urban District Council Mr. J. Swarbrick, chairman of the drainage committee, reported progress in regard to the new drainage scheme. Contracts in connection with the works were signed for a total amount of 100,439*l.* The total cost of the scheme is estimated at 150,000*l.* Mr. Swarbrick said that a hundred men were already employed on the construction of bacterial filters, and it was hoped that these filters would do much to improve the present very offensive condition of the brook.

MR. MAITLAND, coroner, held an inquest on the 11th inst. at the infirmary, Dewsbury, touching the death of Percy Begg, who had died from injuries received at the works of Messrs. Tennant & Rodley, Ossett. He had occasion to go to an upper storey, the flooring of which is composed of perforated iron plates, supported on girders of the same metal, when one of the latter snapped, and he fell to the floor below, and iron plates with him, and sustained terrible and fatal injuries. An examination showed that the girder which gave way had a serious flaw in it.

JUST after the conclusion of Divine service in Rochester Cathedral on Tuesday evening the crown flew off a water tap connected with the supply pipe to the hydraulic engine used for furnishing wind to the grand organ, with the result that a powerful jet of water burst forth. Nobody present knew how to turn the water off at the main, consequently the steps leading

The wonderful durability of IRISH LIMESTONE is well-known.

from the choir to the chancel were converted into a cascade, which flooded the whole length of the nave to a depth of several inches. The water had to be baled out.

THE funds for the memorial of the late Dean of Peterborough have come in so satisfactorily that the cathedral restoration committee have given an order for the work of completing the restoration of the west front to be proceeded with forthwith. This includes the repair of the great central arch and gable, the two turrets flanking the same, and also the pointing pinnacles of the bell tower. It is hoped, therefore, that the scaffolding which has for more than four years disfigured the beauty of the grand old edifice will soon be removed.

THE Press Association announces that the wives of the Lords-Lieutenants in Scotland are being invited to raise county subscriptions for an Anglican cathedral at Cape Town as a memorial of those who fell in the war. Mr. Monro Ferguson, M.P., in view of this appeal, has now written to the moderators of the two Church Assemblies in Scotland to express the objection entertained by himself and other members of Parliament—Scottish and English—to the proposal. The members hold that it is undesirable to promote a sectarian and denominational institution as an Imperial memorial, especially as the Anglican community in South Africa is much smaller and less congenial to both residents and emigrants than the Dutch Reformed Church or other denominations to which the bulk of Scottish colonists more naturally turn. Mr. Monro Ferguson holds that the sacrifices made by the whole empire, irrespective of denominational differences, should not be commemorated by a sectarian memorial.

AT the last meeting of the Middlesbrough Corporation ferry committee, Ald. McLauchlan, in reply to a question, said the Shields Bridge Bill passed the House of Lords, but was thrown out by the House of Commons. He did not think that should prevent them going on with their scheme for a transporter bridge over the Tees at Middlesbrough. They were differently situated from the promoters at Shields. There it was a private enterprise, and they had the Tyne Commissioners, who owned the ferries, the shipping interest and nearly everybody against it. On the Tees the Middlesbrough Corporation owned the ferry, and by adopting a transporter bridge and giving up the ferry they would make considerably more and it would be handier for everybody. Mr. Gadsby had informed him that he thought they could build a transporter bridge between Middlesbrough and Port Clarence for 40,000*l*, and he

thought they should have Mr. Gadsby over to interview them and report on the matter.

THE members of the Hawick Archæological Society, to the number of between 70 and 80, held their annual excursion last week, when they visited Yetholm, Ford Castle and Flodden Field. Proceeding by rail to Kelso, they drove to Yetholm, where they visited the king and queen of the gipsies, who received them very graciously. They live in a small but neat cottage, on which is inscribed "The Palace." The company then drove to Ford Castle and inspected the beautiful pictures, also the room in which King James slept on the eve of the battle of Flodden. Subsequently Flodden's fatal field was visited, the company afterwards dining at Cornhill, and driving back to Kelso, where they took train for Hawick.

FOR the convenience of holiday-makers on the Continent cheap tickets will be issued by the Great Eastern Railway Company to Brussels available for eight days *viâ* Harwich and Antwerp. Passengers leaving London in the evening reach Brussels next morning. Tickets at cheap fares will be issued by the Antwerp route to Berne from the 24th to the 27th instant. For visiting The Hague, Amsterdam and other parts of Holland, the Rhine, North and South Germany, and Bâle for Switzerland, special facilities are offered *viâ* the Great Eastern Railway Company's Royal British Mail Harwich-Hook of Holland route, through carriages being run to Amsterdam, Berlin, Cologne and Bâle, also restaurant-car on the North and South German express trains to and from the Hook of Holland. The General Steam Navigation Company's fast passenger steamers will leave Harwich for Hamburg on July 31 and August 3, returning August 4 and 7.

#### THE LATE EDINBURGH BURGH ENGINEER.

THE burgh engineer of Edinburgh, Mr. John Cooper, died at his residence, 15 Cumin Place, Edinburgh, on the 9th inst. He was a native of Culross. He had a good education at Dollar Academy, served his apprenticeship as a joiner, and was employed in that capacity when he went first to Edinburgh with Messrs. Beattie, Fountainbridge. He became an assistant in the burgh engineer's office in 1872, and since that time he has been in the continuous employment of the Edinburgh Corporation. His general intelligence, industry and great capacity for work, combined with a study which he made in civil engineering, enabled him to rise by successive stages to

THE SILICATE PAINT CO., J. B. ORR & CO., Ltd., CHARLTON, LONDON, S.E.

the position of first assistant in that department of the city's affairs, and, on the death of Mr. Fraser in 1882, he was elected to the position of burgh engineer. Since then the duties of that office have grown enormously. The staff has been increased during Mr. Cooper's period of office from six or seven men to something like sixty. Shortly after his appointment the duties of master of works—an office which had become vacant by death—were added to those of the burgh engineer. Mr Cooper's capacity for work was enormous, and it is not too much to say that he often attempted more than his strength was capable of. In his day not a few important sewage schemes were initiated and carried through, including those of the Powburn, West Merchiston, the Queen's Park and Craigentenny, and latterly he threw himself with great heartiness into the schemes passed by the Town Council for the housing of the working classes, and was responsible for the building of houses of this kind at Tron Square, High School Wynd, West Port, Potterrow, and elsewhere. He was architect for the destructor at Powderhall, and after that he planned and carried through the Dewar Place and M'Donald Road electric-light stations. When the horse tramways were taken over by the city he was appointed engineer to look after the property, and ultimately, when it was decided to introduce the cable, the appointment was changed to joint-engineer with Mr. Colam of the tramway system, the latter being responsible for the mechanical part and Mr. Cooper for the roadways. This entailed an immense amount of worry and work on the burgh engineer, and with his ever-increasing duties in his own special department, it was scarcely to be wondered at that his health gave way under the strain. The deceased was fifty-seven years of age.

### DUSTLESS AND SANITARY COMPRESSED AIR CLEANING.

A NOVEL and useful invention to do house-cleaning mechanically, thus dispensing with the old methods now in vogue, was practically shown and tested at the Empire Theatre, Leicester Square, on Tuesday last, when a section of the carpet in the lounge of the theatre was renovated without removing the carpet from the floor. The process was simplicity itself. A smart white-uniformed operator was quickly pushing along the floor a mysterious-looking contrivance—a metal box with a balloon-shaped white linen cover, bulging with air, and trailing

after it a long sinuous tube, connecting the box with an air-compressing apparatus hidden away in the lower regions. That was all, and as the metal box was rapidly pushed over the carpet surface the cleaning was effected as if by magic. The machine, which is an American invention, as are so many labour-saving appliances, is by no means restricted to the cleansing of floors; upholstery, hangings and walls are equally effectively treated by it. The saving of time and disturbance is immense, and the unwelcome advent of the spring-cleaning season may be awaited with equanimity by the most irritable paterfamilias.

The invention consists of an apparatus, comprising a rectangular box about 12 inches wide, with a hollow handle through which the compressed air is supplied. It is pushed over the carpet by an operator, and is the receptacle in which all the dust is collected. The receptacle or renovator is connected to a source of air supply by means of a rubber tube, which conveys the air under pressure. The machine that compresses the air is electrically driven, and when used in theatres, hotels and flats, it is located in a convenient place in the basement, and the air is conveyed by means of a flexible tubing to where the operators work on any of the floors of the building. For residences where no electrical connections are available a waggon is used which contains a gasoline driven air compressor, and this is transported to and from the residences by its own mechanical power or by horses. The renovator, using compressed air at 75 lbs. pressure per square inch as a force to dislodge the dust and other impurities from the fabrics to be cleaned, gathers all the dust that the carpet contains, and that which naturally accumulates between the carpet and the floor. A great advantage that the compressed-air method possesses over the old one is that the carpets can be disinfected at the same time they are renovated. This is accomplished by means of a disinfecting fluid being fed or passed mechanically in proper proportions into the compressed-air receiver, there commingled and blown entirely through the fabrics and into the crevices of the room. It is stated that one man can clean from ten to twelve rooms in one day, including the ceilings, walls, carpets, curtains, draperies, bedding, woodwork and upholstered furniture. Grease spots and other stains are removed without injuring the nap or fabric of the carpet. Libraries and book-shelves are cleaned without disturbance, and the dust is gathered, and after the cleansing is completed the whole can be disinfected by the same process.

## WATERWORKS OF GIBRALTAR.

AMONG the papers which were on the programme of the recent convention of the American Waterworks Association was one by Professor W. P. Mason, of Troy, N.Y., on the waterworks of Gibraltar. He was unable to present this paper, but has furnished the *Engineering Record* with the following notes concerning it. So carefully are the military secrets of the fortress guarded that even the individual officers of the post are not fully informed as to the nature of the defences outside the section where their duties lie. To such an extent is this carried that the engineer officer designing the works for the new water supply stated that he could not go up the west face of the rock until his pass had been signed in England.

The bold-faced rock of Gibraltar so familiar in pictures faces the land and not the sea; the east side is also very precipitous, while the west slope, although decidedly steep, permits of enough fairly level ground to be found at its base to furnish room for the "city," with its surrounding walls and 20,000 people. The garrison numbers 6,000. The real defences of the place are invisible to the stranger, who cannot locate a single piece of modern artillery unless he chances to be present during a gun drill, when he quickly becomes aware that the cannon are very many and very large.

Gibraltar is not limited to a single source of water supply. For flushing, street sprinkling and the like a brackish water is used, which is obtained from wells sunk in the flats north of the rock and near the neutral grounds. The supply so secured is about 25 per cent. sea-water in winter and about three times that amount in summer, owing to the variation in seasonal rainfall. It is pumped into a tank from which it is distributed by gravity, and is sold at about 5 cents per 120 U.S. gallons.

On the west slope there is a distilling plant for furnishing a potable supply from sea-water. The apparatus is well protected and ready for an emergency, but is not ordinarily in use.

The principal supply is from the rainfall on about 16 acres near the top of the west face of the rock, which has been carefully cemented at a cost of about 30 c. per square yard. The water falling on this area, about 33½ inches annually, passes through a rough strainer of polarite and sand, and is thence pumped into underground storage reservoirs, four in number at present. Each is 201 feet long, 51 feet high, 22 feet wide at the top and 18 feet wide at the bottom. The sides are stepped off by 4-inch ledges every 7 feet, measured vertically. The

sides, bottoms and ends are concreted and plastered with four coats of equal parts of cement and fine limestone. Security against an enemy's shell-fire is not the only advantage of this form of storage, for the absolute darkness which prevails inhibits the growth of aquatic vegetation, and the temperature of the water is maintained constantly at 50 degs. The exact location of these reservoirs a civilian is not permitted to know.

Designs have been completed and work is now in hand for a much larger storage system, to consist of a tunnel driven through the entire rock from side to side, excepting, of course, the unexcavated ends. Exact information concerning the work cannot be secured, but in a general way it is known that the tunnel will be about 400 feet above sea level, 2,000 feet long and 1,311 square feet in sectional area. It is expected to cost 750,000 dols. The catchment area must necessarily be increased largely to provide enough water to fill this new reservoir.

Many of the citizens of Gibraltar store in private cisterns such rain-water as they are able to catch on their roofs; there are nearly 700 of these cisterns. In default of such a supply they purchase water from the Government at the rate of 2 cents per 12 U.S. gallons for rain-water and 4 cents for distilled sea-water.

## WATER IN CONCRETE.

In a recent number of the "Journal of the Western Society of Engineers," Mr. J. Hirtz describes some experiments made for a railway company to ascertain whether any advantage was gained by using concrete mixed rather dry. Authorities on concrete have differed very much on this point, some as the result of laboratory experiments having recommended that the water added should be kept down to the lowest possible amount, while others prefer an excess of water. Actual practice has also differed, for inquiries showed that out of thirty-five prominent railway engineers ten preferred a dry mixture, five a moderately dry one, sixteen a moderately wet mixture, and four a wet mixture. In the experiments referred to the concrete consisted in each case of 1 part of Portland cement, 2 parts of sand and 5 parts of stone. This was mixed by a Ransome mixture and moulded into two 3 feet cubes. In the one case the water added was 82 per cent. of the volume of the dry concrete, and, as a consequence, the mixture was so wet that it was difficult to handle. In the other case the water added was 44 per cent. of the volume of the dry mixture, and

heavy tamping was necessary to consolidate the concrete. This tamping was done on each 6-inch layer. After thirty days it appeared that the wet concrete weighed 9.7 per cent. more than its fellow; it had, further, a much better surface, and on being broken proved of much higher quality, the interior being a solid and compact mass, with the surface of fracture passing through the limestone and granite pebbles of the aggregate. The broken surface of the dry concrete block, on the other hand, showed numerous voids and pores, and a much larger percentage of pieces of stone and pebble "pulled out" in place of breaking. It is obvious from this that plenty of water should be added to the mixture in order to produce the best concrete.

### THE IRON AND STEEL INSTITUTE.

THE autumn meeting of the Iron and Steel Institute of Great Britain will this year be held in Glasgow, from September 3 to 6 inclusive, concurrently with the International Engineering Congress, Section V. of which represents the metallurgical industry. The meetings for the reading of papers will take place in the University Buildings, which are in immediate proximity to the Exhibition. On Tuesday, September 3, the president, Mr. William Whitwell, will deliver a brief address, after which, and on the morning of the following day, a series of papers will be read and discussed. These are no fewer than twelve in number, amongst them being one on the iron and steel industries of the West of Scotland, prepared by a committee of the West of Scotland Iron and Steel Institute, and another being a report on the nomenclature of metallurgy prepared by a committee of the Iron and Steel Institute. The chemical and physical aspects of the metallurgy of iron and steel will be represented by three papers, whilst the practical and manufacturing sides are to be discussed in seven others. Apart from the congress, a programme of excursions to works and of social functions has been arranged by the local reception committee. Thus, after the morning sitting on Tuesday, there will be a luncheon in St. Andrew's Hall at the invitation of that committee. In the afternoon there will be excursions to various local iron and steel works and a visit to the Exhibition. In the evening there will be a conversation by invitation of the Lord Provost and Corporation of Glasgow. On Wednesday the arrangements of the previous day will be repeated, varied in the evening by a banquet to the members of the Institute in St. Andrew's Hall by invitation of the local

reception committee. Thursday will be devoted to excursions to iron and steel works in outlying districts, and in the evening there will be a ball in St. Andrew's Hall. Friday will be wholly given to an excursion on the Clyde in the *Columba*, by invitation of the local reception committee. Ladies will, for the most part, be invited to the social functions, including the Clyde trip.

### THE CEMENT INDUSTRY OF THE UNITED STATES.

THE cement industry in the United States, writes Mr. Bell British commercial agent in the United States, does not appear to be receiving from British manufacturers the amount of attention it deserves.

Although the manufacturers of Portland and other cements are rapidly increasing, there is still a considerable quantity imported. The increase of output of American made cement is barely doing more than keeping pace with the increase in demand, consequently the imports do not show the decrease that might be expected. So many new factories are being built that in time the increase in supply will exceed the yearly increase in demand, and the amount imported will decrease in proportion. It will, however, be many years before the importation of cement falls off entirely. There has been for long a great prejudice among contractors and engineers against the home product, but this is fast disappearing. Doubtless in time it will disappear entirely, and the United States will be able to produce sufficient to supply all its home markets, and will then export whatever surplus there may be.

In 1891 only 13.2 per cent. of the cement used in the United States was of American manufacture, while in 1899 this percentage had risen to 73.9. It is a very sore point with the American cement manufacturers that there are still engineers who specify for imported Portland exclusively, notwithstanding the fact that many of the best brands of the home product are establishing a reputation for high quality, and the manufacturers are willing to offer substantial guarantees. The manufacturers maintain that the domestic product is at least equal in quality to the German, and is from 50 cents to 1 dol. cheaper.

During the nine months ended March last, out of 541,701,557 lbs. imported the United Kingdom only supplied about 11 per cent. The previous year the British cement imported amounted to 9.5 per cent. of the total amount, but in 1889 it was more than 15 per cent.

## THE YORKSHIRE PATENT GLAZING CO., LIVERSEDGE.

### "PREMIER" SYSTEM of GLAZING.

Absolutely the most improved and complete method of

WATERTIGHT GLAZING without PUTTY.

NO OUTSIDE PAINTING REQUIRED.

PERFECTLY DUSTPROOF.

Wherever adopted saves 95 per cent. in maintenance.

Curved Roofs can be Glazed with Straight Glass

SUITABLE FOR ALL KINDS OF ROOFING,

Such as Weaving Sheds, Engineering Workshops, Railway Stations Markets, Arcades, Verandahs, Drill Sheds, Public Baths, Electric Light Works, and Horticultural Buildings of every description

&c. &c.

This System allows for full expansion and contraction of glass, and absorbs any vibration by machinery or other causes.

No Drip whatever from condensation.

All Materials imperishable.

Of foreign cements the German has the largest sale. During the nine months ended March last Germany supplied 46 per cent. of the total amount imported, in 1900, for the same period, 54 per cent., and in 1899 49 per cent. Belgian cements come next with 34 per cent. in 1901, 30 per cent. in 1900, and 32 per cent. in 1899.

On endeavouring to ascertain the reason why the German and Belgian cements are sold so much more largely than the British product, one finds there is a considerable difference of opinion.

The representative of an important importing house, handling three German brands, two British and one Belgian, kindly gives his opinion as follows:—"The falling-off in the sale of British Portland cement in this country, which took place some five or six years ago, was partly due to the fact that the German cements proved so much more satisfactory as to quality, and Belgian cements of fair quality selling so much cheaper, while British makers were unwilling to make any improvement in the quality of their product. Notwithstanding, there continued to be a limited sale for the British brands, but during the last few years British makers had such a demand for their cement at home and from other foreign parts that it enabled them to obtain a higher price for their cement elsewhere than in the United States, so that they did not care to make any concession to the American trade, and this has led to a further decline in the sale of British cement in this country, which in the Eastern and the Western States is at present very unimportant. On the Pacific coast, where the British makers have the advantage of very low freight rates, their cement is still sold in considerable quantities."

An American cement expert gives his opinion as follows:—"British cement was at one time almost the only Portland cement in our market. German cement rapidly replaced it, however, owing to the superior quality of the German product. No doubt some brands of British cement are now much better than formerly, and probably equal to the best German. However, there is an immense number of German masons in this country who prefer the German product, and will use no other. The Belgian cement gained a foothold in consequence of its low price, and has been preferred to the American Portland on account of being an imported article. It is certainly generally inferior in quality. The low price of American cements has nothing to do with quality, but is due to senseless competition among American manufacturers. Tests made by a multitude

of competent engineers show that the best American cements are superior to all other brands. In my judgment the only reason why any cement is imported is that the American product has until lately been insufficient in quantity, and also that there are many consumers who are willing to pay a higher price for an imported article, regardless of tests."

The editor of the *Cement and Engineering News*, the leading cement trade journal, has kindly given his views of the question. He remarks:—"Our own idea of the subject is that the German cement manufacturers are more thoroughly represented in the United States, and make a greater effort to obtain orders in the interior than do the British manufacturers. German cements are more thoroughly advertised, and when making contracts with cement brokers they have the contract read that said broker shall employ travelling salesmen to secure orders. In our opinion the British cements imported into the United States are fully equal to the German product, as the makers of the poor British grades find no market here. The German cement obtained a strong foothold in the United States owing to their first introducing cements adulterated with 2 per cent. or less of gypsum, which controls the setting of the cement, and for this reason they have maintained their prestige among certain consumers."

These three opinions cover pretty nearly the whole field, and none of them, unfortunately, are favourable to the British manufacturer.

The price of the German cement imported during the nine months ending March averaged a little over 40 c. per cwt. The Belgian averaged nearly 35 c., and that from the United Kingdom about 43½ c. per cwt.

The previous year the German cement averaged 40 c., the Belgian about 33½ c. and the British over 44 c. per cwt.

These figures would indicate that the Belgians are able to do their business on account of the low price of their product notwithstanding its accepted inferiority, while the Germans are underselling the British, it being conceded that there is not much difference in the quality of their best brands.

In 1898 there were 31 works in the United States producing 3,692,284 barrels of Portland cement, valued at 5,970,773 dols., and in 1899 there were 36 works producing 5,652,266 barrels, valued at 8,074,371 dols. That is to say, there was an increase of 53 per cent. in quantity, but only 35 per cent. in value.

The principal States where Portland cement is manufactured are Pennsylvania, New Jersey, New York, Ohio and Michigan.

The Lehigh Valley region in Eastern Pennsylvania and Western New Jersey is the seat of the first successful establishment for the manufacture of Portland cement in this country, and has from the first produced more than the rest of the United States combined. This is due to the occurrence in that district of an immense deposit of clay limestone belonging to the calciferous formation which has nearly the composition of a Portland cement mixture.

There are two works in the district said to be larger than any other works in the world. One is producing 8,000 barrels per day, and is increasing its capacity still further.

There are other localities more favourably situated as regards fuel than the Lehigh Valley, and have abundant supplies of material suitable for making Portland cement, so it is possible the production of the Lehigh region may be surpassed by some other.

There has been an average annual rate of increase in make of about 40 per cent. during the last ten years and an average increase of 55 per cent. during the last four years. This rate cannot continue without bringing disaster to the trade. Were it to do so the annual production in four years would exceed the amount at present made in Germany.

In all new works in this country the rotary kiln is invariably adopted for the manufacture of cement; in fact, over 70 per cent. of the cement made in this country is now burned in rotary kilns. It is found that the quality of the product is at least equal to that made in the older forms of apparatus. It is more economical than burning in the vertical variety of kiln and gives a larger output.

Comparing the results of the different kinds of kilns, it has been found that the Dietzsch kiln turns out from 75 to 80 barrels per day, with a fuel consumption of about 20 per cent. by weight of cement produced; the continuous shaft-kilns produce from 40 to 80 barrels per day, with a consumption of fuel of about 30 or 40 per cent., while the rotary variety will produce from 120 to 160 barrels per day, with a consumption of solid fuel of about 30 per cent. Though the consumption of fuel by the rotary kiln may be higher than some of the other kinds, the cost of labour is considerably less than any of the others. The labour cost per barrel by the rotary kiln is given as from 2½ to 4 cents, while that by the continuous shaft kiln is given as from 12 to 14 cents. This is not the only difference. It requires five shaft kilns to equal the product of two rotaries, and the cost, kiln for kiln, is slightly less in the case of the rotary plant. This should mean probably another 1½ cents, representing the

interest on the greater cost of a shaft kiln plant, in favour of the rotary system. Taking one thing with another there is apparently an economy of several cents per barrel in favour of rotary kilns which is likely to be increased as further improvements are adopted.

In modern American cement plants, as in nearly every other works in the United States, the notable feature is the substitution of fuel and power for labour. Manufacturers understand the necessity of reducing the cost to a minimum. Machinery is substituted wherever possible to eliminate labour. Crude petroleum and natural gas are used when possible for fuel, and the latter is sometimes used to drive the engines. In some of the modern works electric power is used for driving the machinery as well as for lighting purposes. In the best arranged works the rock, from the time it is loaded into trucks in the quarry to the time it is packed as finished cement ready for shipment, is not once moved by hand. The only manual labour employed in the mill proper is that necessary for operating the machinery. The main idea is to make the plant as nearly approaching automatic as possible.

Every known mechanical device for rapidly and efficiently handling the materials is introduced wherever possible. This is often done at considerable cost, and the apparatus is duplicated as far as possible in order to avoid delays should any part become broken. This is considered as of considerable importance in the manufacture of cement where the wear and tear is so great.

In addition to Portland cement, large quantities of natural rock cement are manufactured. This is chiefly made in the States of Indiana and New York. In the year 1899 there were 76 works, producing 9,868,179 barrels, valued at 4,814,771 dols. The total consumption of imported Portland cement during the same year was 2,108,388 barrels, and of the domestic Portland 5,652,266 barrels, bringing the total consumption of all kinds of cement up to 17,628,833 barrels.

#### WYMONDHAM CHURCH RESTORATION.

THE ancient and interesting church of Wymondham is to undergo a course of thorough restoration at a cost of some 20,000*l.* under the supervision of Mr. Wm. S. Hicks, who recently restored Newcastle Cathedral. It is not proposed to add to the actual building, but to thoroughly restore such as is in existence. In doing this all the old stone and woodwork

will be utilised as far as possible, and any new work that may have to be put in will be an exact copy of the old. Everyone who attends church will be glad to learn that the unsightly—and not particularly safe—gallery at the west end of the middle aisle is to be abolished, as are also the pews and awkward “boxes” which now serve as seats for the congregation. In place of the latter proper wooden benches will be erected, and by means of these much more seating accommodation will be available. According to the plans we find the following alterations and improvements are to be made in the east end of the church. The sanctuary is to be raised to its original level, which can be seen by the position of the Abbot's monument. This part of the building will be greatly beautified by the addition of a lofty reredos of stone, whilst instead of being an eyesore, as at present, the bare wall at the back of the altar will be beautifully painted in fresco, and thus make a very handsome east end to the church. The doorways from the sanctuary, which have now been closed since 1410, will be opened and iron-framed doors erected. The vestry for the clergy will be built in the east tower in such a way as to be scarcely visible from without. The floor of the choir will be laid with slabs of black and white marble, and the choir stalls will provide seats for seven men and eleven boys on either side, besides accommodation for four lady choristers in the arches. The space at the east end of the south aisle, which was originally used as a vestry by the parish clergy and monks, will be used as a vestry for the choir. From here doors will lead to the choir stalls and to the south aisle. The pulpit will be moved further to the west of the church. The choir organ will be situated on the south side of the choir, and the organist, who will sit with the choir, will thus be able to control both that instrument and the large organ in the west tower, which will be connected. The present organ was built in 1793, and as may be supposed, the mechanism is anything but perfect. Unless the player is well acquainted with its somewhat eccentric habits, peculiar effects may result. The cost of rebuilding the organ, which will retain some of the pipes and outer case, is estimated at 1,000/. The west end of the church now claims our attention. We have already mentioned that the gallery is to be abolished, and this will necessitate the removal of the organ from its present position further back into the west tower, where it will be placed on a new screen of three arches, somewhat lower than it now stands. The great and beautiful arch in the west tower, now almost blocked from view by the gallery and organ, is to be thrown open, and

a groined roof, the height of the arch, will be made above the organ. This alteration will add nearly 60 feet to the length of the church. The entire floors of the middle, north and south aisles will be lowered a foot, bringing them to their original level. This is shown at the base of the Norman pillars, which will not be touched. To lengthen the south aisle, the present vestry will be done away with. In the north aisle the small door at the east end will be closed, and a side altar erected for use at week-day services. The window in this aisle will be opened, and all tracery, as well as the mullions which exist, will be made use of, whilst the parts that may be missing will be filled with accurately fitted work of a like pattern. As far as the exterior of the building is concerned, the lead will be removed from the roof and recast on the spot. Thus, when reroofing, the old metal can be utilised again. The west tower will be completed in the style it was originally intended. The east tower, beyond a few necessary repairs, will remain untouched. It is anticipated that the alterations will take about three years.

### GERMAN TRADE.

THE British Consul, in his last report on the trade and industry of the Grand Duchy of Baden, writes :—

The rise of German trade and industry has been one of the most astonishing facts of the latter part of the nineteenth century. With gigantic resources and ample capacity for feeding their own population, the United States may perhaps for many years flourish and prosper under a high protective tariff, but whether Germany, that has hitherto been quite unable to feed its already rapidly-increasing people, will be able to successfully imitate and follow the example of America seems more than questionable. The conditions are so very different. On the other hand, it may be said that not even the German protectionists contemplate pushing matters to such an extreme, and that the necessity, or at least the wish, to establish trade treaties with neighbouring countries will of itself fetter all such aims. That no doubt is true, but unfortunately it is also true that in such questions nations and statesmen have no real will of their own. It is as with the armaments that grow ever heavier; every Government would fain stop the increase, but circumstances are prohibitive. There is a certain degree of analogy. Treaties or no treaties, internal conditions in Germany demand higher duties; no German statesman can ignore it, and whether under such impulse a general wave of

higher protection shall extend throughout Europe or not is a consequence that no Government or nation can control.

One feature that has had some influence in bringing about the present position, and which may continue to affect it, is the system of mortgage in Germany. No other nation in the world has carried it to such development. This natural resource of a country long comparatively poor in capital under ordinary conditions appears perfectly legitimate, and in Germany has been gradually brought to the utmost efficiency. Without its help, indeed, Germany would hardly have risen to its present rank. When a man buys land, or builds a house or a factory, unless rich, he will in most cases seek to liberate his capital again by mortgaging the investment. It is customary to do so, and he enjoys every facility for doing so. No prejudice exists on the point as in the United Kingdom, and not merely private individuals, but landowners, manufacturers and public companies freely avail themselves of such resource. Germany has some thirty-four mortgage banks or institutions whose collective issue of obligations amounted up to June 30, 1900, to 6,496,150,000 marks. The amount of capital invested in mortgages is somewhat difficult to determine. Dr. Felix Hecht estimated the total for the public mortgage institutions of Europe at the close of 1898 at 26,690,000,000 francs, of which Germany's share alone reached 11,600,000,000 francs, while Russia had 6,570,000,000 francs, Austria-Hungary 2,840,000,000 francs, and France only 1,790,000,000 francs. A wealthy country like France has no occasion to burden its land and other real property with debts as poorer countries must do to furnish themselves with capital to develop their resources. The total amount of capital placed in mortgages is, of course, much larger. For Prussia alone it was reckoned in 1892 at 16,500,000,000 francs, and the rapid growth of obligations of the Hypothek banks from about 3,970,000,000 marks at the end of 1893 to 6,298,000,000 marks in 1899 is remarkable.

The latest authority on the subject, Herr Rudolf Eberstadt, puts the present total capital invested in mortgages in Germany at the frightful (erschreckende) sum of no less than 40,000,000,000 marks, or upwards of 2,000,000,000%, to which a critic in the *Frankfurter Zeitung* remarks:—"Considering the very large amount of mortgage obligations held by insurance companies, foundations, trustees, savings banks and the like, and the certainly much larger amount in the hands of private capitalists, the total sum of mortgages in Germany must indeed have risen to gigantic dimensions, even if the statement of

40,000,000,000 marks may not prove somewhat over the mark. The system partly explains the rapid growth of the cities and the springing up of the countless houses and factories, but unfortunately it also favours speculation and extravagance of all kinds, and also the rapidly-increasing cost of living. Eberstadt in referring to the influence of the British money market on German Government securities ascribes their low price partly to the absorption of capital in Germany in speculative and unproductive operations, and apparently considers it a permanent source of depreciation of such first-class securities." Another authority also says:—"Although our Government stocks are quite as safe, their elevation to the same high value as the British and French must under the circumstances remain a pious aspiration."

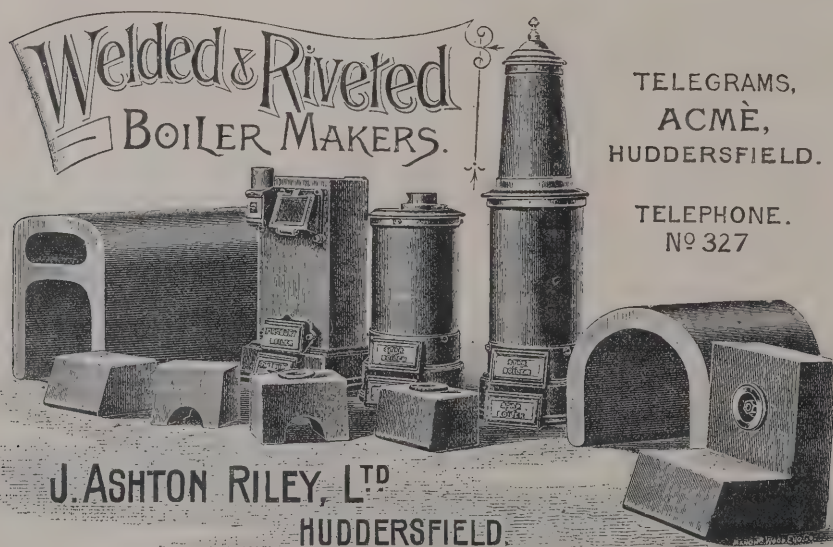

Owing to the dearth of money the best industrial undertakings had to pay  $4\frac{1}{2}$  to 5 per cent. in 1900, the governments, municipalities and mortgage banks 4 per cent. Even the German Imperial Government borrowed money at 4 per cent. The banks, of course, profited by such high rates and for the most part did a fair business. Almost all German stocks, industrial and others, suffered, however, in 1900, and the depreciation involved enormous losses. Even the best securities were not unaffected. This is partly attributed to the legislation on stock exchange business and time bargains, which in seeking to repress gambling and speculation is said to have produced very untoward results and contributed to injure the credit of the country.

The glass factory at Waldhof had a good year's trade, but complains that the demand in the United Kingdom for polished glass has fallen off considerably, and that the high price of coals and want of workmen limits production.

The German Portland cement factories are much affected by the gradual loss of the American market, the United States producers being able to cover almost the entire demand in America. Hitherto Baden factories have been compensated by the large home inquiry, but in 1900 there were not so many public works in hand, and building in general was sharply checked by the high price of money.

The metal industries in the first quarter of the year enjoyed the utmost prosperity, orders pouring in in spite of rising prices, and only towards June did it become fully recognised that the tide had changed, and then things gradually went from bad to worse, till towards the close of the year many branches were almost at a standstill for want of business. In the course of the year prices fell 30 to 40 per cent, and the depreciation of

share capital in numberless mining and industrial concerns was very great. Some of the rolling mills being under contract for years in advance to the Prussian Railway Ministry held their own; makers of agricultural tools and machinery and a few other departments also did well, but they were the exceptions. The electrical industry which a few years ago promised to conquer the world, and which already in 1899 suffered a decline, went back further still in 1900. Orders might be had, but in face of the higher cost of material and the difficulty of obtaining capital, electrical plant does not pay, and even for illuminating it is complained that municipalities charge too high prices. Steam, gas and petroleum have again their turn.

#### GERMAN WORKSHOPS AND WORKMEN.

A CORRESPONDENT connected with one of the great manufacturing firms of this country has sent to the *Times* the following report from one of his foremen who was lately sent by the firm to inspect some of the more recent workshops in Germany. The writer of the report stated verbally "that the men in the shops he visited appeared to be trying to do their best, not, as is often the case here, only what is necessary to pass muster."

*Works.*—Well arranged. Each department self-contained; no traffic of workmen from one department to another; great economy in transit of material. Light and ventilation and method of drawing dust from machines are excellent. Every provision made for the personal cleanliness of the workmen.

*Workmen.*—Clean, orderly, with steady hands and great delicacy of touch; full of interest in their work, working steadily from bell to bell, and never taking advantage of the foreman's absence. Each man at his post, just as ready and anxious to start at the appointed time as our men are to leave off.

*Quality and Cost of Machining.*—Kept in beautiful working order, with great economy in use of oil and stores generally. One man working two, three or four machines according to the nature of the work. I watched the application of their various tools, timed the operations and gauged the quality of the work, which I found to be excellent, both turning, planing, milling and boring, and, taking one operation with another, their cost of machining would be about one-half the cost of ours.

*Accurate Tools and Method of Producing Them.*—Their tools for gauging and testing work are of the most improved

kind, giving a positive reading to a much finer degree than ours. Their methods of producing cutting tools for giving correct form of thread, &c., are excellent, and enable the workmen to proceed on well-defined lines with very great accuracy.

My visit was in every respect educational in point of order, system, accuracy and economy, and the problem which I set myself is the application as far as possible of the various improved methods which I have seen to the greater and more varied productions of our works.

#### ROAD-MAKING IN JOHANNESBURG.

THE difficulties attending the formation of roads and streets in Johannesburg may be judged from the subjoined copy of the report from the acting town engineer:—

The following suggestions are made with the view of reducing the cost of supervision in connection with the making and repairing of roads and streets.

Instead of having a white overseer constantly watching each small gang of natives, I would divide the municipal area into, say, three or four districts, and have one competent overseer to each, whose duty it would be to take charge of all road gangs within his district.

The objection some people might have to this is that the natives would not do much work without an overseer being continually with them. To obviate this difficulty I would pick out a suitable boy from each gang, give him a shilling or two extra and make him responsible for the amount of labour which ought to be done by his gang.

The district overseer should visit each of his road gangs several times a day. When the stone for metalling (which should never be broken on the street) is carted to the required place the natives would simply have to spread the macadam to its correct thickness and curve, as directed by the overseer, so that if the quantity of stone were delivered in proper proportions to the number of natives employed at each place—and I see no reason why this could not be done—there should be no difficulty about the labour. The district overseers should see that all returns of labour and material, as required by the engineer, be handed to the road foreman daily, who will be responsible for the correctness of the same.

There should be a first-class man appointed as road

foreman, whose duty it will be to receive instructions from the engineer, transmit those instructions to the overseers and see that the work is properly executed; to receive all daily returns and assist the booking clerk with the wages sheets and apportionment of the various works. He would also have charge of any other work on the streets, such as mason's work erected departmentally, cleaning of pits and drains, tar, macadam, &c., and see that any person who has permission to break up the street for laying pipes, &c., leaves the surface of the road or footway in a satisfactory state.

This is a general idea of a system which, after many years' experience both in England and this country, I feel sure would lead to a satisfactory result, and bring the cost of road-making, so far as the supervision is concerned, down to a minimum.

At present there are seven white overseers employed, five with an average of eight natives to each, making and repairing streets, one with seven natives preparing and laying tar macadam, and one with seven natives cleaning pits and drains.

For the present I recommend that only two road overseers be employed for ordinary steel metalling work, who will each have charge of, say, thirty natives, on the principle already explained, instead of eight.

One overseer for tar macadam work, and one overseer for cleaning pits and drains. This would effect an immediate saving of 28% per month on wages for overseers, and taking the amount of labour employed on the roads before the war at the ordinary wages, the reduction would amount to about 25% per month.

In this connection the question of native and coolie labour arose.

It appears that great difficulty is being experienced in getting suitable men to remain in the service of the Council, owing to the fact that they are able to obtain more remunerative employment elsewhere.

We have still under consideration the advisability of importing natives from the coast, and our recommendation in this respect will be submitted at a later date. In the meantime we recommend:—

(a) That the acting town engineer be instructed to effect the changes in the organisation of road-repairing gangs, recommended in his report.

(b) That T. Watters, who left the Transvaal on the outbreak of hostilities, be reinstated in his former position as road inspector, at a salary of 30% per month.

(c) That the Council engage natives and coolies under a monthly contract; one month's notice to leave being given on either side.

(d) That a letter be written to the Commissioner of Police, requesting that natives and coolies' passes be rigorously examined, as at present many desertions take place, and the men cannot be traced.

### THE NEW KURSAAL FOR HARROGATE.

At the Harrogate Town Council meeting, the mayor (Alderman Milner) presiding, Alderman Hudson, chairman of the spa and pleasure-grounds committee, said that the tenders for the new Kursaal had been gone through, and the total cost amounted to 40,106% 18s. The successful contractors were:—Masons, Messrs. Graham & Sons (Huddersfield), 14,313% ; joiners, Messrs. Raworth & Allen (Harrogate), 5,623% ; slater, Mr. Atkinson (Leeds); plasterer, Messrs. Noddings & Sons (Harrogate); plumber, Mr. C. Foster (Harrogate). Messrs. Graham & Sons had amended their tender to include Pateley Bridge stone at an extra cost of about 350%. They intended to push the work on as quickly as possible.

Alderman Simpson asked if any arrangements had been made as to enforcing a penalty if the contractors did not complete their work within the specified time.

The Town Clerk said he had prepared agreements for all trades, which were ready to be signed, so that the work could be commenced in about a week. The penalty he had included was 20% per week after twelve months had expired.

Mr. Beale (the architect, London) said a penalty clause for the larger trades was all right, but it would be rather difficult to arrange one for the smaller contractors.

The matter was left with the mayor (Alderman Milner), the chairman of the committee (Alderman Hudson), the town clerk and the architect for final settlement.

Mr. A. E. Marsh, of Wakefield, was elected clerk of the works at a salary of 3% 10s. per week.

The Town Clerk was instructed to make application to the Local Government Board for sanction to borrow 1,250% for the construction of a sewer in Otley Road, and also for the necessary money for the purchase of Collins Fields, adjoining the Valley Gardens, in Cornwall Road, these having been occupied at a cost of 16,000%, with a view to enlarging the existing pleasure grounds.

# The Architect.

## THE WEEK.

WHEN the competition for the new Government Offices at Westminster was first announced there was uncertainty whether the architects who prepared the accepted designs would be entrusted with the erection. Afterwards it was decided that the late Mr. YOUNG and Mr. BRYDON were to have charge of the realisation of their own plans. It was also arranged that the former was to receive 23,750*l.* and the latter 26,000*l.* in return for services, the amounts being 5 per cent. on the estimated cost. The War Office will be carried out by a son of Mr. YOUNG. The public offices will be erected from Mr. BRYDON's plans by officers of the Office of Works. The contracts will be entered into under the supervision of Mr. TANNER and Sir JOHN TAYLOR. The First Commissioner says he hopes to effect a considerable saving by the arrangement. The architects' fees for the Victoria and Albert Museum will amount to 25,000*l.*, and for the Royal College of Science to 10,000*l.*

WHILE the Council House of Birmingham endures the name of the architect, HENRY YEOVILLE THOMASON, who died at Kensington on the 16th inst., cannot be forgotten. The building now differs in appearance from its original state, for the art gallery and gas offices were later additions, and were not contemplated when the design was prepared. Birmingham has also grown, and the Council have to deal with many municipal enterprises. The building is, therefore, hardly large enough for its present requirements. But when it was erected it was like a revelation in Birmingham, and suggested what architecture could do for the adornment of the Midland capital. It has exercised a beneficial influence on the people, and if architecture receives more appreciation than formerly, the change must be attributed in a large measure to Mr. THOMASON's work. He had reason to do his best for the town. He belonged to an old Birmingham family, and his grandfather, Sir EDWARD THOMASON, filled the office of High Bailiff. It was in Birmingham also he received his architectural education. Born in 1826 he was still young when he was articled to CHARLES EDGE. Then he became manager of the architectural department of the borough surveyor's office. When he had gained experience he set up as an architect, and his family connections at once enabled him to acquire a larger practice than usually falls to the lot of beginners. He designed the Synagogue in Singers Hill, the Francis Road chapel, the Union Club in Colmore Row, St. Asaph's Church, the offices for the *Birmingham Daily Post*, *Daily Gazette* offices, the main building and two infirmary blocks at Aston Union Workhouse, the Birmingham District and Counties Bank, and the blocks of offices on the east and west sides of this building, the Atlas Buildings and Atlas Electroplating Works, the Homœopathic Hospital, "Lewis's" shop, the first building of the kind in Birmingham (1886), numerous residences in Edgbaston and other places round Birmingham, also many manufactories and warehouses. One of his latest works was the Jaffray Suburban Hospital. In consultations, arbitrations and the like his services were often required. He was gentle and retiring in disposition, and anyone who imagined that a Birmingham architect must be pushing and fond of advertising himself would be disappointed in meeting Mr. YEOVILLE THOMASON. Some years ago he came to London to reside, and only visited Birmingham on special occasions when his varied experience had to be utilised.

THERE is a possibility that the view from Richmond Hill may after all remain undestroyed. It should be regarded as a gift from nature to man, and accordingly be transmitted to posterity with all the qualities with which it was endowed. The respect for property is so powerful in England we suppose it never will be possible for scenery to be considered as part of the national riches, and every individual who happens to have possession will be able to deprive the entire population of one of their boons. Sir WHITTAKER ELLIS was able to ascertain that the Marble Hill Estate could be secured for 70,000*l.*, which under the

circumstances was not an exorbitant sum. The negotiations, however, were broken off before any definite arrangements for the sale of the property could be made. Lord MONKSWELL, as representative of the parks committee of the County Council, has recently taken up the subject. After several conferences with the owners he was able to announce on Tuesday that the London County Council can obtain the Marble Hill Estate, comprising 66 acres and a house, for the sum of 70,000*l.*, but the purchase is to be completed before the end of the year. Although outside the Metropolitan area, there are few ratepayers who would object to the slight addition of the taxation which will be necessary to acquire land which is so indispensable if London is to possess one of the most charming of English scenes.

BUILDING-OWNERS should be warned that if there are law-suits about their property there is great risk in making charges against the architect or builder. Although the amount claimed was only 70*l.* 2*s.* 11*d.*, the case CHEALE *v.* DE PINTO, which was tried at the Hastings County Court, is as much of a warning as if it were heard in the High Court. The plaintiff, a timber merchant, took over the contract for the completion of the building of a house at Bexhill. He executed the work, and the architect had certified it was properly carried out. Counsel for the defendant interposed at the beginning of the case by saying he was instructed that the words "to the satisfaction of the architect" were not in the original deed. That was an allegation of a most serious kind. But evidence was not brought forward to support it. Mr. ALTON, the architect, said the orders for extras were often given in his presence by the defendant, and several witnesses testified that the defendant did give such orders. The defendant said that he told the original builders that he had decided to expend no more than 250*l.*, and no extras were to be recognised unless there was his written authority. Two architects were called to prove that the work was inferior and the measurements did not correspond with the specification. An effort was also made to upset the claim on the ground that the original contractors had filed their petition on March 10, and therefore the assignment of the balance of the contract a month afterwards was invalid. Judge MARTINEAU decided in favour of the plaintiff, saying that practically the whole of the work to be done had been performed. There were a few deviations, but he thought every shilling claimed was due except two guineas in respect of these deviations.

A LARGE sum of money will shortly be available for the erection of workmen's dwellings, which are to be known as the Sutton Model Dwellings. Mr. SUTTON, of Sydenham, a millionaire, who died in May 1900, made a will in 1894 by which he left the greater part of his estate for the purchase of land in London or other populous towns to be used as sites for model dwellings and to erect such dwellings. A clause was also introduced relating to the employment of architects, agents, workmen and others. Afterwards Mr. SUTTON married and revoked the will. Then he made a new will, which confirmed the earlier one and in which, after giving his wife a life annuity of 5,000*l.*, he left the residue of his estate for the purpose of erecting the model dwellings. Some of his relatives brought an action for the purpose of having it declared that the residuary gift contained in his will for the purpose of providing workmen's dwellings was void in whole or in part. It was argued on their behalf that under the older Mortmain Acts the gift of residue was wholly bad; that here there was a gift for a particular charitable purpose indicated by the first and second clauses of the trusts of the residuary gift, which, as they contended, tried to create a charitable trust even under the Act of 1891. It was also argued that the gift, if valid at all, was to be confined to the purchase of five acres only and the cost of erecting dwellings thereon. Judgment was given on Tuesday, when it was declared that the charitable disposition to provide dwellings for the poor at a reduced rent was a good trust and the disposition was valid. The gift of residuary estate was also wholly good. The control of the fund has been left entirely in the hands of trustees who are authorised to make all arrangements for the erection of the buildings.

## CHEVREUL AND THE LAWS OF COLOUR.

BY erecting a statue of CHEVREUL the Parisians have honoured a man who helped to advance the industries of the city. It would be well if a second statue of the centenarian were put up at Lyons, for the silk trade of the southern city derived as much advantage from his teaching as any of the productions of the capital. But in many other parts of France memorials of CHEVREUL should find a place. The investigations of colour were only a part of those which he conducted during his long and laborious career. The list of subjects inscribed on the pedestal of his statue is a lengthy one, for, in addition to his inquiries about colours, it refers to researches in dyeing, soap-making, candle-making, stearine, fatty bodies, organic analysis, &c. In fact, it was to organic chemistry that CHEVREUL was devoted at the time when he was asked to take charge of the dye-works of the Gobelins. It should be remembered that he was born in 1786, and when he lectured on the simultaneous contrast of colours in 1828 he was no boyish phenomenon like LYON PLAYFAIR, who expounded the mysteries of agriculture to farmers and land-owners.

He was brought to the Gobelins on account of the complaints which the weavers were making about the defects of the colouring of the threads with which they were supplied. He found that the dyes employed were as excellent as could be found in France, and he was therefore, after many experiments, compelled to conclude that the want of effect in the tapestries was due to a disregard of the laws of contrast in the arrangements of the colours. It consequently became incumbent on him to give more attention to the scientific aspects of colouring in order that he might formulate rules which would appear to have scientific certainty. CHEVREUL knew that long before his time tapestry was produced in uncivilised countries, and the pieces were as perfect as any that could have been executed in the Government factory. But he could not take it for granted that French designers and weavers would be as sensitive as Easterns to defects of colour, and his laws were therefore substitutes for natural gifts.

It is possible that the strict attention which was given to CHEVREUL's proportionate areas of various colours produced effects that were machine-like, and were wanting in the freedom with which nature applies colour, and which her followers can remotely imitate. The tapestry of Beauvais, which might be described as a variety of Gobelins work, but more applicable to furniture, exemplified his teaching. C. R. LESLIE, R.A., tells us that at the Exhibition of 1851 "in the apartment containing the French tapestries there were no combinations of colour among them that were not tawdry, excepting in those from Beauvais, which were exact copies of Persian carpets, and though the porcelain and other manufacture of china were very scantily represented, yet the superiority of the arrangements of their colour to the greater portion of such displays in the European departments was very remarkable." Yet it could not be said that the Chinese weavers or potters followed any rules formulated by a native CHEVREUL, but they were guided by their own sense of colour and the experience that was derived by following traditions expounded by craftsmen. In a good example of Chinese industrial art, as well as in an oil-painting by a master hand, there are subtleties which are not to be attained by the following of arithmetical recipes by which the extent of every colour is measured.

CHEVREUL's system can be judged from his remarks on the application of colour in buildings. He was able to realise the difference between pictorial and decorative treatment. Whether it was a window, a mural painting, a hanging or a carpet, he insisted that the subject should be presented before the spectator without confusion and as simply as possible. Picture windows in which flatness was not recognised and chiaroscuro effects were attempted, he judged to be out of place. Glass that was absolutely white or colourless, he maintained, should never be used in a coloured window, ground-glass being preferable. It is only in large buildings, according to CHEVREUL, that coloured windows possess all the effect of which they are capable. He regarded them as transparent tapestries, and did not wish to see them clash with the tapestry made in looms which, when placed near stained-glass windows, loses the

harmony of its colouring. But he was not an advocate for the painting of the walls of Gothic churches. In the windows he considered sufficient colour to gratify the eyes of the spectator was provided. More varied effects became distracting. On that account he preferred the roof of Rheims Cathedral when it was seen to be stone vaulting, rather than when it was painted blue and sprinkled with fleurs-de-lis. The proposal of BOISSERIE that the roofs of churches should represent the heavenly vault found no favour with CHEVREUL.

While admiring coloured windows, CHEVREUL was not indifferent to the advantages which sometimes arise from the use of those in which no stained or painted glass is introduced. The storied windows richly light are bad neighbours, and cause confusion in any other coloured materials which come near them, but with white glass it is possible to have mosaics, mural paintings, coloured sculpture, rich marbles and much else which is beautiful to the eye. There is, however, the risk that with several such objects a church would become a museum rather than a house for prayer and meditation. On the whole, therefore, as purpose should be respected, CHEVREUL gave preference to the old Gothic churches of France rather than to Renaissance buildings.

It is hardly necessary to say that he was an admirer of the colouring adopted by the Egyptians in their buildings. One consequence of BONAPARTE's invasion was the revelation of their chromatic experiments. LANCRET, who was one of the official writers of the Republic, had prophesied that one day it would be found that Egyptian colouring was like much else in art, subjected to inflexible rules. CHAMPOLLION had also said that he would undertake to convince anyone who was sceptical of the skill of the Egyptians as painters in less than a quarter of an hour if he could bring him into the Temple of Ipsamboul. The hieroglyphics, according to CHEVREUL, were coloured in order that they might be easily read, and the colours were various so that they might harmonise with other coloured figures. He believed the Greek temples were, on the contrary, coloured because pleasure was afforded in that way rather than from a desire to render different parts of a temple more distinct. The principal lines, such as the fillets of the architrave and those of the cornice, were red; the mutules blue, and their guttæ white; the triglyphs blue, their channels black, and their guttæ white, and the more extended parts of the frieze and the cornice, as well as the architrave, were of light yellow. The rules which CHEVREUL gives were, however, not universally obeyed, for as well as may be judged from the remains of the temples different schemes of colour were tolerated.

He studied the subject for so many years, it was only in keeping with his character that at the age of ninety-eight CHEVREUL should send a paper to the Institut de France, of which he had long been a member, on "Sight in connection with the Contrasts of Colours." The phenomena cannot, in fact, be properly dealt with if the state of the vision is ignored. The great BUFFON had observed the differences which exist between colours when looked at separately and when they were seen combined. He described the changed character by the phrase "accidental colours," which he said arose from too great a vibration or from fatigue of the eye. CHEVREUL must have had BUFFON's theory before him when he mentioned that he made his experiments when his sight was not fatigued, and that his own experience was confirmed by others who were competent to judge of colours. It required immense labour before CHEVREUL was able to lay down the following simple law as having universal signification:—"In the case where the eye sees at the same time two contiguous colours they will appear as dissimilar as possible, both in their optical composition and in the height of their tone." So little was known about the effect of the simultaneous contrast of colours that even the foremost manufacturers of wall-papers in Paris sometimes had disputes with their colour preparers about carelessness in matching colours, when the defect, if it could be called so, was the result of optical and chromatic conditions. CHEVREUL mentions one case where grey patterns were printed on grounds of apple-green and rose. The patterns appeared to resemble in colour the complementary of the ground, and the pro-

priotor maintained that his instructions were not obeyed, for no grey was used. It was when listening to a lecture by CHEVREUL in 1829 that the unlucky colour mixer realised the cause of the failure. In colour printing, as in other matters, "things are not what they seem." An able colourist can, therefore, often produce surprising effects in his pictures, like DELACROIX, who on the ceiling of the French Senate painted figures with flesh tints equal to those of RUBENS mainly through the agency of a hatching with green paint.

The disputes among the paper-stainers are evidence of the state of knowledge about colour when CHEVREUL began to instruct his countrymen on the subject. In places which have not the artistic reputation of Paris, manufacturers would not now be ignorant of the effects of the juxtaposition of colours. That is in a great measure owing to the labours of MICHEL-EUGÈNE CHEVREUL. Those who treated of the subject before his time considered it to be the exclusive property of painters of pictures. But to CHEVREUL a picture, a drawing, a carpet, a curtain, a stained-glass window, a soldier's uniform, a garden bed, were equally interesting, for he saw in them only exemplifications of the same laws. He was therefore a true representative of Republicanism, although he was born a few years before the Bastille was demolished, and he was no less of a cosmopolite, for his investigations became known throughout the world. He was proud to own that a foreign Sovereign was willing to give financial aid towards the publication of his principal work, and the interest of the ruler's subjects would be served by the outlay.

#### AMERICAN DICTIONARY OF ARCHITECTURE.\*

AS the importance of an art, profession, calling or business is suggested by the number of terms which relate to it, a dictionary becomes a test which cannot be questioned. For architecture they are remarkably numerous. A student of natural science would be able to assert that his botanical or entomological dictionary contained a far larger number of words than are used by architects and builders. But in those cases they deal with the multitudinous products of nature, while in architecture we have only the creations of a limited number of men. A law dictionary or a medical dictionary relates to man in general, whether organised in states or suffering from afflictions which may be almost universal in their operations. Compared with them architecture can be considered as almost individual in its terminology, and the abundance of its technical terms must therefore be amazing to all who judge the subject impartially.

The second volume of Mr. STURGIS's dictionary begins with "Façade," and ends with "Nymphæum." In the 1,060 columns which are required for the explanation of the different subjects we have a record of many varieties of building. Architecture, as we have said, is the creation of men, and its history would therefore be best exemplified by the biographies of its professors. In the pages we find accounts of many of its representatives, from ICTINOS to HUNT. Unfortunately the names of some of the greatest artists remain uncertain or unknown, for all the explorations which are now in progress have not made many additions to architectural biography.

It is also a characteristic of the dictionary to give comprehensive articles on the architecture of the most important countries. In the new volume the architecture of France, Germany, Greece, India, Italy, Japan, the Mediterranean islands, Mesopotamia, Mexico, the Netherlands and North Africa, the last being by Mr. ALEXANDER GRAHAM, is treated; there are also allied articles on Gothic architecture, monastic architecture, mausoleum architecture, Latin architecture, neo-Classic architecture, &c. Various classes of buildings, such as houses, iron and steel framework buildings, libraries, music-halls, are also described.

The conclusions drawn about the modern state of architecture are sometimes a record of progress, sometimes the reverse. Japan, to take one instance, which has in so

many ways assimilated itself to Europe, has not as yet found compensation for the abandonment of its native and most picturesque architecture. Mr. R. A. CRAM says:—

It is only in domestic work that the traditions of true architecture remain; European styles are now popular, and the results of the attempts at adapting them to Eastern conditions are not encouraging. So far as one can see, the period of good architecture is over in Japan. The native attack on Buddhism two centuries ago was the beginning of the end, the restoration of Shinto was its continuation, and the acceptance of Western civilisation was its consummation. For thirteen centuries it has developed as civilisation progressed, each period perfecting some special quality until it reached its climax of decorative splendour under the first of the Tokugawa shoguns. It is now a dead style, a thing of the past, and with all other manifestations of art in Japan must for ever remain so, unless some utterly unforeseen revolution brings back the ideals and principles of a great but now misguided people.

Mexico, on the contrary, where it might be expected that art was defunct, would appear to be using the later styles with great spirit. According to Mr. T. F. TURNER:—

Modern architecture in Mexico is original and independent in its character, and, while resembling modern work in Europe, it is still quite unlike anything that the present century has produced on the Continent. Its chief characteristic is the rapidity with which in late years it has seized new materials and new conditions of construction and adapted the same to the solution of the problem in hand. Galvanised iron becomes a legitimate architectural material in the Mexican work of today. . . . Mexican architecture is unique in its boldness of colour and outline. It will bear close study, as being full of the character of the nation which produced it and, in general, expressing frankly the originality and thought of the designer. The use of gorgeous tiles and coloured washes are its most interesting features, and yet colours are handled with a vigour and ease that show the Mexican to be an adept at such work, and an excellent master to any who would learn the use of colour in architecture.

English architects are described as rarely successful in India, but the native architects, although they may not be equal to their predecessors, produce buildings which have artistic interest. Several erections are mentioned as exemplifying the capabilities of modern Hindoo architects in a very favourable light. Indeed, it must be allowed there has been no little presumption in the British efforts to set examples of our capabilities before the Indian artists. Beginning with the attempts of South Kensington to teach them the principles of their own ornament and the rules by which colour should be supplied, unto the "palatial" buildings which recall the dreariness of Pimlico streets, the evidence of British power is so ridiculous we need not wonder if critics in other countries condemn all that has been perpetrated.

There cannot be much about England in the subjects which come under the letters of the second volume. A weakness of Jacobean architecture is ascribed to the educated architect. We are told that "for the first time in English history the architect appears, and with his advent the skilled mechanic who could interpret and carry out the surveyor's sketch began to disappear. In this lies the interpretation of the successes and failures of Jacobean and later work. There was more knowledge needed to design and less knowledge to execute." INIGO JONES is mentioned in connection with the style, but he is described as neither superior in Gothic nor in Classic. It is assumed that about that time the country houses built by residents and courtiers in London were of masonry and in Classic style, while proprietors who resided in the country erected half-timbered houses. English Gothic is noticed in one of the sections of the style. There are also short biographies of some English architects, and examples of English work are introduced in illustration of technical terms of other subjects.

The contents of the volume are not, however, confined to historical accounts of buildings or memoirs of their architects. What are commonly called practical subjects also appear, and explain the latest attempts of the inventive Americans as well as of European builders. Nor are the simpler forms of architecture overlooked. Mr. DELLEN BAUGH, a painter who is an authority on American archaeology and ethnology, contributes several interesting articles on the habitations and other buildings of the American

\* *A Dictionary of Architecture and Building: Biographical, Historical and Descriptive.* By Russel Sturgis and others. In three volumes, Vol. II., F.N. New York: The Macmillan Company. London: Macmillan & Co., Ltd.

Indians and of tribes who are supposed to be in the rear of civilisation. For instance, the Esquimaux can build a snow house in about two hours, and the adoption of domical and circular forms suggests relations with some of the remote Asiatic buildings which the late WILLIAM SIMPSON describes. The following extract will explain the systematic manner of constructing the "Igluqak" in northern regions:—

For the best results, snow must be deep and compact enough to permit homogeneous blocks to be cut out with the snow knife, an implement of bone, shaped like a short sword, or with a stiff steel saw when this can be obtained. A proper site being selected on some deep drift, a small block is removed as a beginning, and in the excavation thus started the builder works, rearing the circular walls around him, the bottom of the excavation made by the removal of the blocks finally forming the floor of the finished house. The blocks are about 8 inches thick, 24 inches high, and about 2½ to 4 feet long. One man can build a small house alone except fitting the last block; but generally two work together, one cutting blocks and the other fitting them in place, supporting the upper ones on his head while adjusting them. The first block set is of a wedge shape, the point toward beginning, thus forcing the second course to mount without a break upon the first, and making the line of blocks continuous from start to finish by giving them a spiral trend. The advantage of this device is increased strength and ease of construction, because there is no actual beginning of new courses, and each block laid has at once a firm support on two edges, enabling the builder to incline it inward to approach the centre. The builder "breaks joints" as he goes. The circumference is decreased regularly. The end joints of the blocks are slanted, so that the end of the new block laps over the end of the last one, and as the incline towards the horizontal grows greater, so also does the bevelling or slanting of the edges, the better to sustain the fresh blocks. Into the last opening a key-block is fitted binding the dome firmly together, and thus it stands till warm weather comes, when it is abandoned for the tent. When the spiral of blocks is finished, the joints and openings are filled with fragments of blocks or with crushed snow till the walls are perfectly tight, only a small hole being left at the top for ventilation. No smoke outlet is needed, as heat and light are obtained from seal-oil lamps.

A volume of the new "Dictionary of Architecture and Building" is one which it is pleasant to linger over, for whether the pages are perused systematically or at hazard there is sure to be much which attracts attention by its interest. But any attempt to describe the varied character of the contents in a limited space must be a failure, and therefore an injustice to Mr. STURGIS's valuable work. There is instruction for the young architect to be found in it, and if one learned in the art professes to have failed in discovering novelties, he will at least meet with much that will revive old associations. But the use of the book should not be limited to professional students. The general reader will meet with much that he will be glad to know about, and on that account a copy should be found in every one of the public libraries which are frequented by English people. The illustrations, which consist of reproductions of photographs and of views of English and foreign works, are very numerous. The scale drawings by Japanese draughtsmen will surprise many readers by their excellence.

### WOTTON AND THE EVELYNS.

ON the 17th inst. the members of the Surrey Archaeological Society visited Wotton Church. Dr. F. R. Fairbank, F.S.A., read a paper on its history. He said that in Domesday Book, which was the result of the survey made in 1085, the manor of Odestone, or Wotton, is returned as having been held in the time of King Edward the Confessor by one Heraldis, but was then held by Oswald, one of the king's thanes. The jury of the hundred declare that they know not by what tenure Heraldis held it. It was not worth as much at the time of the survey as it was in the time of King Edward, as was so commonly the case. There is no mention of a church, which is remarkable, as churches are mentioned as existing in most of the neighbouring places, such as Abinger, Shere, Albury, Dorking, Mickleham, Buckland, Betchworth and others. Speaking generally, the non-mention of a church in Domesday is not necessarily a proof that one did not then exist, as no instructions were given to the Commissioners to report on the existence of churches, and it is therefore likely that the returns in this respect would vary, as indeed they did. One church only is returned in Cambridgeshire,

and none in Lancashire, Cornwall or even Middlesex. The advowson of the church appears from the first to have gone with the manor, and to have continued so to the present time. The church itself has many points of interest, the tower being the oldest part. It is not square; the width from north to south is greater than the length from east to west. The north, south and east sides appear of the same date, but the west side appears to be later. The eastern arch is exceedingly plain and the masonry very rough; the stones of which it is built vary in size, some of them being very large, and they are roughly cut. There are no mouldings. Opinions differ as to the age of this tower. Dr. Fairbank offered the opinion that it is of Early Anglo-Norman date and character, or possibly Late Saxon. It appears as though originally the eastern wall formed the division between the nave and the chancel, and that the western wall was built afterwards, forming it into a central tower, with chancel and probably apse to the east, and a nave to the west and a doorway to the south. There are now no evidences above ground of this nave. It would be well if some slight examination of the ground were undertaken to endeavour to ascertain its size; this would not be costly, and would not disturb the graves. That was without doubt the form of the church until in the thirteenth century it was remodelled; the nave was then removed and the western arch of the tower was built up, a small lancet light being inserted in the upper part. The chancel also was removed, and the whole of the new church was built to the east of the tower, much as it now is. The nave does not present much interest; there is a pair of lancets on the south side, the larger windows are modern insertions, the walls are much thinner than those of the tower. The large arch across the chancel is modern; on each side of it, in the face of the wall, will be noticed portions of a small arch. Previous to the building of the present arch there was a small one, and indications of others were on each side of it. He had not been able to obtain much information about them; they are suggestive of an arcade of three arches, which is occasionally found in Norman and Early English churches. There are in the tower three small bells. Two of them are described by Stahlshmidt as of the latter part of the fourteenth century; the third bell bears the date 1602. There is no staircase to the tower; this is usual in Norman churches. The font is modern, as is the porch. The outside of the doorway from the porch to the tower is of later date than the tower itself. At the restoration it was found thickly covered with plaster, which was cleared away; the stones of which it is built are alternately chalk and freestone; a similar arrangement is also found inside the church. The registers of baptisms and burials commence in 1596, and of marriages in 1603. The communion plate is of seventeenth-century date. The most interesting event here is the burial of John Evelyn, the author of the "Diary." His tomb is the one shaped like a coffin, standing under the east window in the mortuary chapel, and the epitaph sets forth that he was second son of Richard Evelyn, and that he fell asleep February 27, 1705, in the eighty-sixth year of his age. He is so well known as a learned and good man that little need be said of the importance which his "Diary" possesses as a history of the times in which he lived. He was a *persona grata* at Court throughout the troublous times of the seventeenth century, and he was a good man at a time when virtue was not altogether the fashion there. There is not much in the "Diary" about this church; he tells us that when he had arrived at the mature age of four years he was instructed in the rudiments of learning by one Frier by name, in the porch of Wotton Church. At that time it was common for the school of the village to be held in the tower or porch of the parish church. He speaks of several funerals of members of his family who were buried here, which must have been very imposing scenes. They took place mostly at night. When his brother Richard died in 1698 he was buried with extraordinary solemnity, rather as a nobleman than as a private gentleman; there were over 2,000 people present, all the gentlemen of the county doing him the last honours. The services of the church do not appear to have been, at that time, very satisfactorily conducted.

In the churchyard there is a beautiful marble urn to the memory of William Glanville. This monument has much interest locally, as it is the scene year by year of a curious ceremony. Mr. Glanville left estates to the amount of 30*l.* yearly for the purpose of paying five poor boys of the parish of Wotton, under sixteen years of age, 2*l.* each, on condition that they should attend on the anniversary of his death and, with their hands laid upon his gravestone, repeat aloud by heart the Lord's Prayer, the Apostles' Creed and the Ten Commandments, and also read the fifteenth chapter of St. Paul's First Epistle to the Corinthians, and write two verses from it. This ceremony takes place on February 2 of each year, which is called 40*s.* day. This Mr. Glanville was the nephew of John Evelyn; he appears to have been somewhat eccentric, as he gave orders to be buried 18 feet deep. His father had the odd wish to be wrapped in lead, and taken out to sea and dropped

overboard on the Goodwin Sands, which, after his death, was carried out.

At Crossways Farm Mr. Ralph Nevill, F.S.A., pointed out that this building of ornamental brickwork and Bargate stone resembles others of its type in the neighbourhood, and at Godalming and Dorking. It is chiefly interesting because it has been so little altered from its original plan, and not at all for between 200 and 300 years. The house probably dates from 1640; the staircase is part of an older house; the kitchen presents an ingle-nook fire with an iron fireback showing two heraldic dogs similar to that in the hall at Wotton.

The camp on Holmbury Hill was described by Mr. H. E. Malden, which has been surrounded by two banks and two ditches. It is a hill camp in which flint implements have not been found in any quantity, though they usually are in camps of this kind. This camp is certainly not a Roman camp, as it is entirely different from their type; it has two ditches and two banks, where the Romans would only have had one. Roman camps were rectangular, and seldom on the top of a hill, as in the absence of artillery such a position would not have commanded the country. Hill-top camps such as this were camps of refuge for non-combatants and women while war was going on. This camp could not have withstood a siege as there is no water supply; indeed, sieges were impossible with barbarian armies. The fortifications here are unusually strong, and, with the primitive instruments of the time, point to political cohesion so as to command so much labour to complete it. This camp, like that on the top of Hascombe Hill, is roughly rectangular upon three sides, and in both the south and north sides follows the side of the hill. It is probable these camps belong to the period after the Romans left the country, and before the invasion of the Saxons. No subsequent history is attached to this camp; it does not seem to have been used for the same purpose at any later period. The battle of Ockley, between the Danes who came from London and the people of Wessex, was fought considerably east of this, on the slopes of Leith Hill. Anstebury is said to have been occupied by the Danes on this occasion, which is probable. At a much later date this country was much occupied by smugglers; one old man, now 98 years of age, living near here, remembers seeing twenty men on horses, each with a keg of brandy. A naval cutlass was found here some time back, probably lost in a fray with smugglers. A fine stone celt, or hatchet, was found near here when levelling the cricket ground.

On visiting Wotton the members were received by Mr. W. J. Evelyn, F.S.A., who conducted them through the house and grounds. The family of Evelyn is known to have resided at Tower Castle in Shropshire; from there it removed to Harrow-on-the-Hill, and again to Kingston-upon-Thames; from thence to Long Ditton, and from thence to Wotton. The first of the family who resided at Wotton was George Evelyn, formerly of Long Ditton; his monument is in Wotton Church with the figures of his two wives and twenty-six children. From this George Evelyn, by his second wife, John Evelyn, the diarist, was descended, and from the same George Evelyn, by his wife Rose Williams, is descended the present head of the family.

In the mortuary chapel of the Evelyns at Wotton Church is the monument of Richard and Eleanor Evelyn, parents of the diarist. It is interesting to compare these alabaster figures with their portraits at Wotton House. It will be seen how exact the sculptors of the sixteenth and seventeenth centuries were in their work. In the library are arranged a number of interesting objects, among them the original diary of John Evelyn. In the cases are several family miniatures, and a lock of hair from the head of Charles I., and a lock from his beard; the hair is dark brown, that of the beard auburn. The conservatories are full of choice flowers, and lead into the well-cared-for ornamental gardens, in which are fish ponds and a fountain, and at the end of the gardens is a portico or temple, referred to by John Evelyn in his diary February 26, 1649, as follows:—"Came to see me Captain George Evelyn, the great traveller, and one who believed himself a better architect than he really was, witness the portico in the garden at Wotton; yet the great room at Albury is better understood. He had a large mind, but he overbuilt everything."

Mr. Ralph Nevill proposed a vote of thanks to Mr. Evelyn, who responded.

### THE OLD CLOTH HALL AT NEWBURY.

FOR many years Mr. Walter Money, F.S.A., as local secretary of the Society of Antiquaries, and as one of the trustees of the charity to which this singularly picturesque old structure belongs, has exerted himself, says the *Reading Mercury*, to preserve such an interesting connecting link between the present and the past commercial history of Newbury. From time to time Mr. Money has brought the matter before the Society for the Preservation of Ancient Buildings, the Society of Antiquaries, the National Trust, and the British Archaeological Association, before which latter body

he read, in the year 1896, what was described as "a valuable contribution on the Guild or Fellowship of the Clothworkers of Newbury," which is printed in the *Journal of the Society*, and illustrated with an admirable view of the Old Cloth Hall. It will also be remembered that on the visit of a distinguished party of artists to Newbury, under the guidance of Mr. Money, Mr. Seymour Lucas, R.A., Mr. Ernest Crofts, R.A., now Keeper of the Royal Academy, Mr. J. G. Waller, F.S.A., and others, warmly advocated the claims of this memorial of bygone generations to careful restoration. Sir John Evans, D.C.L., F.R.S., a former president of the Society of Antiquaries, and many other eminent "savants" have also expressed their desire to help forward the effort being made to preserve this sadly-neglected building from irretrievable decay. The date of the erection of the old hall is uncertain, but its architecture bespeaks it to be of the Jacobean period, or possibly somewhat earlier. The upper part is supported by oak columns or piers, the intervening spaces being closed up with brickwork, with a series of semicircular wooden arches on the exterior wall between the columns, and above is a bold cornice on large projecting brackets or trusses, richly carved with grotesque heads. The lower part was originally open, and here the old clothiers of Newbury daily congregated, at the time when the town was one of the largest seats of the clothing manufacture in the kingdom.

The whole matter is still in an embryo stage, but it is assuming some practical shape under the active encouragement of the present public-spirited Mayor of Newbury, it being intended, provided the funds can be raised and the property purchased, to utilise the lower part of the hall as a local museum, and the first floor as a gallery for the annual exhibition of pictures of the Newbury Art Society and other like purposes. Mr. A. Waterhouse, R.A., having kindly placed his services at the disposal of the Mayor and those interested in this praiseworthy movement, visited Newbury on Saturday and made an inspection of the premises, with a view to obtain an approximate estimate as to the cost of adapting the building for the purposes above mentioned. Mr. F. Mount, brother of the member for the Newbury Division, accompanied Mr. Waterhouse, and is, we believe, associated with the architectural profession.

### THE BRITISH ARCHÆOLOGICAL ASSOCIATION.

THE fifty-eighth congress of the British Archaeological Association was held this year in Newcastle-on-Tyne, the opening meeting being on Thursday, the 18th inst. The Mayor received the members and expressed regret that the Corporation had not in their custody a very great amount of archaeological interest to show them. Prior to 1835 he believed there was a good deal of plate, ancient earthenware and other objects of antiquarian interest in the Mansion House at Newcastle, but when the reformed Corporation came into existence in 1835 it was largely disposed of. There were still seven silver maces carried in olden times by the Serjeants-at-Mace. There were twelve originally, and he could not say where the five had disappeared. Probably they were sold by auction along with other articles. They had also a silver cup presented to the Corporation by the grandchildren of Bishop Cosins in 1681, a salver of the date of 1753 won by George Bowes, a member of a well-known local family, in addition to two or three ancient charters granted to the city. They would have an opportunity of inspecting these objects.

The President (Dr. Thomas Hodgkin) said he was one of those who did their best to preserve one of the old wall towers of Newcastle, destroyed within living memory. The old walls, he believed, were nearly complete at the beginning of the nineteenth century, but they had practically disappeared before the march of improvement.

During the day the members visited the cathedral, the castle, the Black Gate and other places in the city.

In the evening the delegates were entertained at a conversation at the Durham College of Science, and a meeting was held when Dr. Hodgkin delivered his address.

In the course of his remarks he said that, as compared with some other districts of England, they were not rich in prehistoric remains. They had some well-marked British villages or hut circles. They had many barrows, containing evidences of both methods of disposing of the dead—both by sepulture and cremation. They had also some remarkably fine specimens of those mysterious cup markings incised on rocks which had aroused so much interest among antiquaries, and which, whatever might have been their purpose—religious, epigraphic, or simply artistic—might, he supposed, be safely stated to be the oldest remains of any kind to be found in Britain. But as they did not propose to make any of these prehistoric monuments the goal of their pilgrimage during the ensuing week, he would not longer dwell upon them, nor invite them to discuss the interesting question whether they

were to be assigned to the earliest inhabitants of our island whom scholars now spoke of as Iberians or Eskuarians, or rather to their better-known Celtic conquerors. For convenience sake, the year of our Lord 100 should be their starting-point, and he would divide the eighteen centuries which had since glided by into six periods of 300 years each, and describe as briefly as he could the leading features of each of these six periods. The Roman period lasted, roughly, from A.D. 100 to A.D. 400. In these three centuries the history of Northumberland was practically the history of the great Roman Wall, and of the Roman roads which ran either along it from sea to sea or across it from the river to the mountains. They were invited to visit the two finest camps on the line of the wall—Chesters, once known as Cilurnum, overlooking the lovely glen of the North Tyne, and Housesteads or Borcovicus, seated on the crest of a high basaltic wave, commanding a wide view of Northumbrian moorlands. The former of these camps they knew to have been garrisoned by a troop of Asturian cavalry from the north of Spain; the latter by a cohort of Tungriens from the country which we now call Belgium. But though the Roman wall was a military work, and the camps which they would visit were camps and not peaceful cities, he prayed them not to let their imagination repeople them only with scenes of war and bloodshed. In the centuries of Roman dominion there were undoubtedly long intervals of comparative tranquillity. So large a force of fighting men—not less than 10,000—with all their camp followers, wives and children settled on that narrow neck of land between Tyne and Solway, must have exerted a powerful influence on the economic condition of the country. He had sometimes startled visitors by suggesting that the middle region through which the Wall runs was far more populous and possibly more prosperous in the second century after Christ than it is at the present day. His next period must be called “Chaos and the Northumbrian Kingdom.” For the first century and a half after the departure of the Romans nothing is known with any certainty as to the history of Northumbria. The pall was partially lifted for us when Ida, the Anglian chieftain, first of Northumbrian kings, builds his wooden burgh on the high basaltic rock of Bamburgh. And yet even then, though they heard something of the succession of kings, and of wars with the Britons of Redesdale, there was for us no history of living interest till the year 617, when Edwin of Deira began his too short but glorious reign. Edwin, Oswald, Oswy—these three Christian kings of Northumbria, whose reigns covered the better part of the seventh century (617-70), seemed likely to found a dynasty which would extend its rule over the whole of Southern Britain. But for some obscure and unexplained events in the eighth century Bamburgh might have been the London, or at any rate the Windsor, of our island. And if Bamburgh was the Windsor of that great Northumbrian dynasty, Holy Island might fitly be called its Westminster. The Venerable Bede was associated with the two churches of Monkwearmouth and Jarrow. He feared they would see both places grievously changed from that quiet loveliness which they may have worn on a spring morning when Bede thus vibrated between them. “Sweet Jarrow” especially was now overhung with smoke, and resounded to the ringing blows of the sons of Tubal Cain. The chapter of Northumbrian greatness must be considered closed, at latest, in the year 793, when Holy Island was ravaged by the terrible Danish pirate, Ragnar Lodbruk. The world little knows what it may have lost when Holy Island was ravaged by the Danes, and when Jarrow and Monkwearmouth were given to the flames. The Normans came in 1066, and whatever other things they might have left unchanged in our island, they certainly changed the character as well as enormously increased the number of its fortresses. He believed it was generally admitted that the pre-Conquest fortresses, the Saxon burghs, had consisted chiefly of a high mound of earth, surmounted by a wooden palisade, without masonry. The Normans introduced the massive rectangular keep, or its sister the lighter shell keep. He thought he might term that, their fifth period, the age of castle building, remarking at the same time that here, too, he was not able to avoid a certain overlapping of periods, as the year 1300, which should end his castle-building age, marked instead the transition from the old Norman type of the solitary and massive keep to the later concentric type of castle, with barbican, gatehouse, curtain wall, postern and all the other appliances for combined and converging defence, with which an inspection of the ruins of almost any fourteenth-century castle made them familiar. Now, for that period no excursion could be more instructive than that which they would take the following day, when they would visit, under most competent guidance, the two great castles of Alnwick and Warkworth, the visible memorials of the greatness of the feudal barons of the house of Percy. But, moreover, the “New Castle” which gave their city its name, erected by Henry II, the nearly contemporary castle of Bamburgh, and the Castle Palace, College of Durham, would, he trusted, be considered by them not unworthy specimens of that triumph of defensive architecture (in the days previous to the

introduction of villainous saltpetre), the keep of the masons from Normandy. Of course, while emphasising the military character of most of the Norman remains in the district, he did not altogether forget their ecclesiastical glories. To mention the great minster of Durham, and the daughter-mother abbey church of Holy Island, was to call up the remembrance of some of the noblest and most daring of Norman church builders. His next period (1300 to 1600) he would call the period of the Border wars. From 1600 to 1900 was, notwithstanding some interruptions from civil war and from two soon suppressed rebellions, on the whole an era of peace and prosperity. For them he could only use the hackneyed quotation, “Si monumentum quaeris circumspice.” The wilderness of houses in the midst of which they met, the bridges, the factories, the iron foundries, the long lines of dull streets, lined with grim Classical architecture, the smoke, the clangour, the Central Railway station—that maelstrom of man—all or nearly all of this busy world has sprung into existence since the Mayor of Newcastle-on-Tyne kneeled to James Stuart, and to most of these there is no corresponding ray in the archaeological spectrum. Only, since the beginnings of all mighty changes should have an interest at any rate for the historian, he would ask them when they were travelling westward by the Newcastle and Carlisle railway to get their guide to point out to them a little inconspicuous house on the north bank of the Tyne between Ryton and Wylam. There lived for some years, and not far from it was born, the man who, by a simple mechanical invention, had revolutionised both worlds, that of commerce and that of war, the only man, he thought they might say, who had been the cause of such changes in the surface of our globe, as with telescopes such as we possess might be seen from the nearest planet—the inventor of the locomotive, George Stephenson. He would gladly have described to them at some length what archaeology had achieved and suffered during that most changeable period, how some of our most interesting monuments had fallen victims to what was called architectural or industrial “improvement,” and how, on the other hand, a noble succession of students, Horsley, Hodgson, Bruce and their living successors (whom he named not, though he trusted they would soon make their personal acquaintance) had carried on the work of Camden and of Cotton.

On Friday the ruins of Hulne Priory were visited. Mr. Patrick, honorary secretary, explained that Hulne Priory was a monastery of the Carmelite Friars, and possessed all the features of a fortified position. The Carmelites were one of the four Mendicant friar orders, and took their name from Mount Carmel, in Palestine. The origin of the monastery at Hulne was said to be due to Lord de Vesci and Sir Richard Grey, who visited Mount Carmel and prevailed upon some of the members of the order to return to England. This was about the year 1238. Tradition said that the site was selected because of a fancied resemblance which it bore to Mount Carmel. The foundation of Hulne Priory dated from about 1240, and the first prior was Rodolphus Fresborn.

Alnwick Castle was afterwards visited, Mr. Cadwallader Bates acting as guide. One of the chief points of interest to the party as archaeologists was the fine Norman gateway. The splendidly kept library in the castle was greatly admired. There was considerable curiosity to see the old dungeons, and a general smile was raised when it was seen that the approach thereto was now rendered easy by means of the electric light having been installed. Mr. Bates told how Cromwell sent 6,000 prisoners to Alnwick Castle after the battle of Dunbar, of whom 3,000 perished, and on the remainder being deported to Morpeth so many more died of pestilence that of the original 6,000 prisoners but a single thousand escaped death. The pictures in the castle and the many magnificent appointments engaged a good deal of time whilst a severe thunderstorm raged overhead.

At Warkworth only the castle could be inspected. This is the stronghold mentioned by Shakespeare in “Henry IV.,” in which he speaks of the Earl of Northumberland lying “crafty sick.” The structure was described in detail by Mr. Bates. Had time permitted the Hermitage, which is dealt with in the famous poem of Bishop Percy, “The Hermit of Warkworth,” and also the ancient church, would have been inspected, but the delegates had reluctantly to forego the pleasure.

At the evening meeting Mr. T. Blashill presided.

The Rev. Caesar Caine, M.A., read a paper on “The Archbishop's Mint at York.” He said the privilege of minting, which the archbishops of York had in common with other ecclesiastical dignitaries, was of greater antiquity than any documentary evidence belonging to the see. When this right originated was a question which perhaps could never be determined now. Of all attempts to give this mint a settled historic treatment the most elaborate was that of Robert Dune, published in 1854. There were certain periods—a hundred years of Anglo-Saxon times, and from the Lancastrian to the Tudor dynasty—and they had documentary evidence that the Archbishop's mint was in active operation at the time of the Norman

Conquest. In Anglo-Saxon times the coin of Egbert (732 to 766 A.D.) was most interesting. Egbert was the brother of the reigning king of Northumbria, and the coin was the joint work of the two brothers. Mr. Caine described the coins of Albert, Eanbald and succeeding archbishops. In 928, Athelstan enacted that there should be one money for the whole of the king's dominions; but how far the law affected York was not certain, because the city at this time was in the hands of the Danes. Athelstan did not become master of the place till nearly ten years later. He referred to the Peter pence, these being produced only by the ecclesiastical mint at York, but by whose authority was uncertain. These coins had no connection with the tribute to the Roman pontiff, though bearing the same name. The Peter pence bore the name Peter in reference to the apostle, patron of the church at York. Coming to the second period—the period of documentary evidence—he explained that there was much information in the registers of the archbishopric. There was no mark by which they could identify with certainty coins as the work of any particular archbishop until the time of John Kempe, archbishop in 1426 to 1452. They were able to identify the coins of the nine archbishops from 1426 to 1531. The last archbishop who exercised the privilege of minting was Edward Lee, in 1531 to 1544.

The Rev. F. S. Colman, of York, read a paper on "Earth-works at Barwick-in-Elmet, Yorks."

On Saturday the members visited Jarrow, where the fine church was described. Jarrow was called by the Saxons Gyrwy, and appears to have derived its first importance from a monastery founded by Bishop Benedict, which was destroyed by the Danes, and afterwards restored by Bishop Walcher, and made a cell to St. Cuthbert's Priory, Durham. The historian Bede, who was born in this parish, was educated at this monastery, having entered it at the age of nine years. Some traces of the monastic ruins are still visible. The church, dedicated to St. Paul, is a stone structure with a tower. It was rebuilt in 1783, and the register dates from 1572. From Jarrow the party proceeded to Monkwearmouth, where they saw the old church; and they went next to Tynemouth, where they saw the priory, which was originally founded by Edward the Saxon king of Northumbria in 625, and afterwards rebuilt of stone by Oswald in the eighth century. Of the structure there are still considerable remains, consisting chiefly of an arch and the eastern portion of the church which was made parochial at the Dissolution, and so continued until 1657, when, having become ruinous, a new parochial church was built at North Shields.

At the evening meeting Mr. C. Lynam, F.S.A., vice-president of the Association, presided.

The Rev. H. J. Dukinfield Astley, M.A., read a paper on "The Resemblance between the Religious and Magical Ideas of Modern Savage Peoples and those of the Prehistoric and Non-Celtic Races of Europe." He said he proposed to show that the religion of the prehistoric races developed along the same lines as the religion of modern savage people. The line of mental and spiritual development was constant. This he would endeavour to show by reference to the rock drawings and other relics which remained to us as a legacy from our own neolithic ancestors. The first glimmering of religion was when man grasped the notion that there were more things in heaven and earth than were dreamt of in his philosophy, and that all things were interchangeable under certain conditions. Then came the notion that the earth was inhabited by spirits, which could assume at will any form they chose. The next stage was that in which it was believed there were good and bad spirits, the former capable of being propitiated and the latter capable of being circumvented. The propitiation of good spirits they called religion, and the circumvention of bad spirits they called magic. Man's early notion about religion resolved itself into a state of magic. He referred to the witchcraft customs and the witch doctor of modern savage races, and said that in prehistoric times religion passed from a state of magic, which they found in full force among modern savage people, till it finally emerged in the higher spiritual form which it had assumed among the more cultivated races of mankind. What was true of the modern savage peoples as to the development of religious ideas from a state of magic was true of the prehistoric people and the neolithic people of Europe. By prehistoric he meant non-Roman and non-Celtic peoples. He exhibited a series of rock drawings from Australia, three from South America, and those discovered in the year 1895 near Dumbarton, on the Clyde. He pointed out the remarkable resemblance found in the representation of a human foot in Scotland and Australia, and said this representation had a living significance amongst the Australians to-day. The Australian believed that the foot mark was left by his ancestors in the long-ago, and it doubtless had a similar significance in Scotland and everywhere else. Speaking of cup and ring markings, he said that in Australia alone a living significance was attached to them to-day. He remarked that there were these markings in Northumberland on that moor dividing the

Cheviot Hills near Chatton Park; engraved boulders with cup-like depressions surrounded by circles. The rock drawings in Scotland he attributed to the Picts. Mr. Astley dealt with the question of the figures found in Scotland, as to whether or not they were forgeries. The last word, he believed, had not been said on the subject. It was said that a place could not be assigned to these figures, but he pointed out that they were not unique in prehistoric times in Europe, for there were undoubtedly genuine relics of the neolithic age from Finland. There must be some other reason for these figures, assuming them to be genuine, than that the artistic sense compelled the people to make them for their own pleasure. The extreme laziness of uncivilised man made it probable that he had a practical object in view, and that the human and animal figures served as household gods or personal amulets for hunting or fishing. He believed that a place for them could be found in a distant time of Scottish prehistoric civilisation. He discussed the use of these ancient relics in religious rites.

Some discussion followed. The Chairman said he had visited the tumuli in Brittany and in Ireland, and was wonder-struck at the similarity between the markings in Brittany and in Ireland. The figures corresponded in every way.

Mr. Andrew Oliver read a paper on "Flemish Brasses in England." He described the difference between Flemish brasses and English brasses, exhibiting a number of rubbings, including the Thornton brass in All Saints Church, Newcastle.

During the week there were visits to Vindolana, Borcovicus, Procolitia and Cilurnum, places which were occupied by the Romans. There was also an excursion, and the cathedral was explained by Dean Kitchin.

### ST. PATRICK'S CATHEDRAL, DUBLIN.

ACCORDING to Sir Thomas Drew, it is not generally known that work now going on in the choir of St. Patrick's is mainly conservative repair, cleansing from mortar and plaster of ancient stonework of the thirteenth century, untouched before by "restoration" for seven centuries, comparatively unharmed by neglect. It will be in a few months a distinct gain in interest for the visitor to Dublin and the archaeologist to find in the eastern end of St. Patrick's a survival of an ancient specimen of beautiful architecture, of the age of 1230 to 1250, comparable with what Salisbury or Beverley Minsters can show.

The ceiling of the triforium passage, familiarly known as the Monks' Walk, which bonds an inner to an outside wall, is formed of great flagstones. Three of these have been observed to be ancient granite tombstones, with raised crosses cut on them identical in character with the St. Patrick's Well stone. There are some other such stones found and identified lately already collected and on view.

Their building in as roofing stones by the Anglo-Norman masons in the thirteenth century places beyond doubt the existence before that time of an important very ancient Celtic cemetery, from which unsuspected memorials of the native dead could be freely appropriated.

The meagre record has been heretofore that in 1190 Archbishop Comyn appropriated the foundation of an ancient Irish church, called "St. Patrick de Insula," and it disappears from history. Eight hundred years later it appears that all record and relics of the ancient Irish church has not been lost in the centuries. The archaic gravestones, with their strange crosses, and some examples of very early Celtic "intrecchio" ornament, now identified and grouped, constitute a thread of record of an ancient Irish church of importance, whose history the Anglo-Norman impropiators did not care to preserve.

**The Prizes** in the competition for the municipal buildings at Hereford have been awarded as follows:—(1) 100*l.*, Messrs. Macintosh & Newman, London; (2) 75*l.*, Mr. H. F. Fowler, Barrow-in-Furness; (3) 50*l.*, Messrs. Stanger & Stanger, Wolverhampton. The following were considered by the committee:—Messrs. Brookes & Son & Godsell, Hereford; Messrs. W. J. Morley & Son, Bradford, and Mr. H. A. Cheers, Twickenham. At a special meeting of the building committee of the Corporation the designs of Mr. Cheers were accepted. The cost of the new building will be close upon 20,000*l.*

**The First Proposal** as to the erection of a memorial of the late Dean Boyle in Salisbury Cathedral was to place canopies over the choir-stalls, but the cathedral architect gave it as his opinion that there were artistic objections to this proposal, and it has therefore been abandoned. At a full meeting of the Greater Chapter it was decided that the most satisfactory memorial would be (1) a mural tablet with a medallion or bust of the late dean, and (2) the filling with stained glass of the four lights of the windows on the north side of the lady chapel.

## NOTES AND COMMENTS.

It will be remembered that litigation arose out of the construction of a station on the City and South London Electric Railway beneath the church of St. Mary Woolnoth, which stands at one end of Lombard Street. The dispute turned on the amount that was to be paid to the rector and churchwardens as compensation. The case was referred to arbitration, with Mr. ROBERT VIGORS as umpire. The award has now been issued. It declares:—(1) That if the Court should be of opinion that the purchase money and compensation are to be paid upon the basis that "all the lands taken are the site of the church of St. Mary Woolnoth, and that the said church is and will remain upon the said site," the company are to pay the sum of 90,628*l.*; (2) if the Court decide "that although the lands taken are at present the site of a church it is possible that by reason of an Act of Parliament or of some scheme under the Union of Benefices Act, 1860, or otherwise the same might but for the passing of the City and South London Railway Act at some future time have ceased to be the site of a church and have become available for building" the company are to pay the sum of 136,421*l.*; (3) that if the Court decide "that the site of the said church and the lands not occupied by the site of the said church respectively can be made immediately available for the erection of buildings other than a church" the company are to pay the sum of 143,548*l.* If the purchaser of the site retains "the right of support" 5,000*l.* is to be deducted from the sum of 136,421*l.*, and if the company are under obligations to make good any damage or injury which may be caused to the buildings erected on the site the sum of 6,000*l.* shall be deducted. In addition the sum of 3,681*l.* is to be paid by the company in respect of the warehousing of church furniture, legal and surveyor's costs, the reinterments, &c. The church is an interesting building, and was erected as one of the fifty new churches for which Queen Anne's Act provided funds. It was designed by NICHOLAS HAWKESMOOR. As a church it has been one of the least used in the City, and in 1863 its removal was advocated. According to the award the appropriation of the site for any other purpose will involve an outlay of about 50,000*l.*

THE name of M. MERODACK may not be known in this country, but he is an enthusiast whose efforts against the renovation of Mediæval buildings have won for him in France the title of "Homme des Cathédrales." Sometimes he appears in various costumes of the Middle Ages, and then he becomes, if possible, a more interesting figure. He is now editor of a paper called *Vieux Rouen-Lisieux*, and his sanctum is either in a tower of the cathedral of Rouen or of one of the ancient churches of Lisieux. From those elevations he wages war against all those who propose to supplant old buildings by new ones. M. MERODACK therefore excels VICTO HUGO's "Quasi Modo," for while the bell-ringer of Notre-Dame used only to set in motion "the cymbals glorious, swinging uproarious," M. MERODACK enters on intellectual battles with all who do not belong to the Gothic school. In this country he would hardly be prized by any archæological society, and he would not be allowed to select a domicile in a church tower; but the French are tolerant of opinions, and Mediævalism, with all its defects, has still attraction for them.

THERE are few more puzzling questions in a legal sense than What is a mineral? When minerals were first reserved there can be no doubt that the word referred to something which was found at a sufficient depth below the surface to require mining before it could be used. But with the improvements in processes of manufacture, clays, which at one time were not thought to possess mineral qualities, became as valuable as coal or iron. A remarkable case arose some years since when the water supply of Glasgow depended on what answer was given to the question. An immense reservoir was constructed on land which the Corporation had purchased, the minerals being reserved to the vendor in the usual way. But it was afterwards found that clay suitable for making firebricks and the like was spread over the surface. A demand was made that operations for its recovery should be continued in the ground forming the reservoir. The Scottish Courts were

divided, and could not agree whether the clay was a mineral. On Saturday a decision was given by Mr. Justice BUCKLEY in a case which was no less remarkable, viz. Great Western Railway Company *v.* Blades. The company had purchased land at West Bromwich, the minerals being reserved to the defendant. In course of time he began to remove a valuable bed of clay, and the excavations were carried to the foot of the railway embankment. Notice was given to the company that the work was to be continued. The company sought to restrain defendant from injuring their property. His Lordship, after hearing the arguments, defined a mineral as something which possessed a value independent of the land, and the clay beneath the embankment must therefore be regarded as a mineral. But, according to his Lordship, clay may be a mineral in one district and not in another. On the other hand, the land which was purchased could not be considered as relating only to the surface, which was in parts no more than 6 inches deep. To remove the clay which supported the surface would be to deprive the land of any value, and the company would have acquired only an easement. Judgment was accordingly given for the plaintiffs, and unless reversed in a higher Court the embankment is safe. Mr. Justice BUCKLEY's decision will confirm what was laid down by the House of Lords in the Glasgow case, that land purchased as a site for a building is not to be restricted to vegetable mould or cultivated clay, but also comprises the subsoil, although it may be a bed of fireclay.

THE effort of Lord STANMORE on Monday in the House of Lords to have a Royal Commission appointed similar in character and object to the Fine Arts Commission of 1842 could only have been a forlorn hope and doomed to failure. In 1842 there was a definite object, viz. the decoration of the Houses of Parliament. Unfortunately for art and artists the results were not successful, and the wall-paintings are taken as warnings against a repetition of the attempts. A commission now would have to be a tribunal of taste to watch over works of art, whether structures, paintings or statues, throughout the country. That would necessitate the establishment of a new Government Department with paid officials and the expenditure of large sums of money in order to give effect to the recommendations of the commission. A more unfavourable time could hardly have been selected for such a project. The war expenses are too burdensome to allow of other additions to the expenditure. Art cannot be forced on the people, and the incomplete state of the Houses of Parliament and other public buildings is sufficient to show that much of the enthusiasm that prevailed in 1842 was only factitious.

## ILLUSTRATIONS.

CATHEDRAL SERIES.—CHICHESTER: SOUTH TRANSEPT.

NEW WORKHOUSE BUILDINGS AT SHOREHAM. NEAR BRIGHTON FOR THE STEYNING BOARD OF GUARDIANS.

THE buildings shown in our illustration have been in progress for the past three years, and are now just ready for use. They stand upon a fine open site of over 20 acres at the foot of the South Downs and a mile from the sea, and provide accommodation for Poor Law purposes for a large area which embraces the wealthy district of Hove as well as many small rural parishes. The central or administrative block includes a lofty dining hall and extensive kitchen offices, and is planned on a scale which shall meet future rather than present requirements, the buildings now completed being only part of the establishment which the site is intended to accommodate. The plan and view sufficiently indicate the arrangement of the buildings, which are of local brick with Sussex tiled roofs. A very complete installation of cooking and heating appliances by CLEMENTS, JEAKES & Co., and of laundry fittings by MACINTOSH and the Blackman Ventilating Co. are features of the arrangements. The general building contractors were MESSRS. PARSONS & SONS, of Hove, and the clerk of works was Mr. GEORGE CARD, the whole of the work being under the direction of MESSRS. CLAYTON & BLACK, architects, of Brighton.

DESIGN FOR THE NEW CHURCH OF ST. COLUMB, NOTTING HILL. VIEW OF THE INTERIOR, LOOKING TOWARDS SANCTUARY.

OFFICIAL REPORTS ON THE FINE ARTS,  
PARIS EXHIBITION, 1900.  
PRELIMINARY ARRANGEMENTS.

By the Duke of Argyll, K.T., and Sir Edward J. Poynter, P.R.A.

THE fine arts committee of the Royal Commission, originally appointed in May 1898 by H.R.H. the Prince of Wales, president of the Royal Commission, consisted of:—  
The Marquis of Lorne, K.T., M.P., chairman; Sir Edward J. Poynter, P.R.A.; Lord Rothschild; Lord Windsor; Lord Pirbright; Sir William Agnew, Bart; Baron Ferdinand de Rothschild, M.P.; Sir John Murray Scott, Bart; the President of the Royal Institute of British Architects; Major-General Sir John R. D. Donnelly, K.C.B.; Major-General Sir Arthur E. A. Ellis, K.C.V.O.; Sir James D. Linton; Mr. Henry H. Armstead, R.A.; Mr. James Staats Forbes.

The above were members of the Royal Commission. There were afterwards added, with the sanction and approval of H.R.H. the President:—

Sir Wyke Bayliss, P.R.B.A.; Mr. Thos. Brock, R.A.; Mr. Frank Dicksee, R.A.; Mr. Fred. A. Eaton, sec. R.A., hon. sec. to the fine arts committee; Sir Thomas Farrell, P.R.H.A.; Mr. Luke Fildes, R.A.; Mr. E. J. Gregory, R.A., P.R.I.; Sir F. Seymour Haden, P.R.E.; Professor Hubert von Herkomer, R.A.; Colonel Herbert Jekyll, C.M.G. (*ex-officio*), sec. Royal Commission; Mr. J. H. Lorimer, R.S.A.; Mr. A. B. Freeman Mitford, C.B.; Mr. W. W. Ouless, R.A.; Mr. Valentine C. Prinsep, R.A.; Sir George Reid, P.R.S.A.; Mr. Linley Sambourne; Mr. Frank Short, R.E.; Mr. Marion H. Spielmann; Mr. Marcus Stone, R.A.; Mr. W. Hamo Thornycroft, R.A.; Mr. Alfred Waterhouse, R.A.; Mr. E. A. Waterlow, A.R.A.; P.R.W.S.

Mr. Isidore Spielmann was appointed secretary to the committee, and in Paris "Directeur de la Section."

The following classification of exhibits came within the scope of the committee:—

- Class 7. Paintings, cartoons, drawings.
- Class 8. Engraving, lithography.
- Class 9. Sculpture and engraving of medals and precious stones.
- Class 10. Architecture.

The section devoted to the fine arts is invariably regarded as one of the chief features of attraction in every international exhibition, and its success depends largely on the regulations and stipulations that are laid down by the exhibition authorities. When, as in the present case, these regulations are so framed as to place foreign nations at a disadvantage, the best efforts are unavailing to secure a proper place in the general display.

The contemporary fine arts section of the Exhibition was installed in the Grand Palais in the Champs-Elysees, one of the permanent buildings erected on the site of the Palais de l'Industrie. In this vast structure the larger portion of the space was appropriated by France, the remainder being divided more or less equally among the other countries. To Great Britain, in the section devoted to painting, drawing, engraving and architecture, there were finally allotted 566 lineal feet as against 900 feet to Russia, 880 feet to Germany, 780 feet to Italy, 600 feet to Belgium, 580 feet to Spain, 490 feet to Switzerland and 400 feet to Portugal.

As may be seen from the foregoing statement, the space set apart for the foreign fine art sections was not only altogether inadequate for a proper representation and display of their work, as compared with the French, but Great Britain received exceptionally unfavourable treatment in this respect; and when the committee began its regular sittings in March 1899 their first step was to endeavour to obtain a larger amount of space than had been allotted to it.

As, after waiting for some weeks, no response was made to our application, the following resolution of the committee was forwarded to the French Administration by the secretary of the Royal Commission:—

"The committee is unanimously of opinion that the space allotted to British art is entirely inadequate to a fair representation of that art; and they venture to express the hope that the authorities of the Exhibition may be able to increase the available space to such an extent as would enable the best examples of contemporary art to be exhibited."

With a view to obtaining a further concession, Sir Edward Poynter went to Paris and saw M. Delaunay Belleville, who promised to do his best to secure additional space. In response to this application, an official intimation was forwarded placing another room at the disposal of the committee. The space, however, was no doubt still very inadequate in which to represent so important a school, and in many instances prominent artists could only be represented by one work.

A further addition of 167 lineal feet was eventually secured by the conversion of the outside gallery or corridor into rooms for water-colours, black-and-white drawings and architectural designs, thus releasing Room 29 for oil-paintings. Two large doorways also were blocked, whereby a little more wall-space

was secured. These alterations had to be made at the expense of the committee, and were satisfactorily carried out by our secretary, Mr. Isidore Spielmann, who was on the spot at the time and devoted himself to seeing that these additional rooms were properly constructed, and at a minimum of expense to the committee.

In the result the space awarded to Great Britain was not disproportionate to that of other countries. It may be summarised thus:—

|                     |           |
|---------------------|-----------|
| Originally allotted | 475 feet. |
| Additional room     | 91 feet   |
| Corridor rooms      | 167 "     |
| Blocking doorways   | 50 "      |
| Total               | 783 feet. |

The authorities allotted 250 square metres to British sculpture.

At an early stage of the organisation of the section the committee relegated to the sub-committee all matters concerning the selection of and applications for exhibits; the arrangements respecting their insurance, collecting, packing and transport; the decoration of the rooms and all other matters not involving questions of principle. Upwards of twenty meetings were held by the committee and sub-committee during the progress of the work; those at which artists and works were selected were very protracted.

The principal clause in the "Actes Organiques" affecting the section of the fine arts is as follows:—

"The contemporary exhibition is open to the works of French and foreign artists which have been executed subsequent to May 1, 1889" (Titre IV., Article 19)

This regulation guided the action of the committee in its application for works, and was strictly adhered to.

Artists' claims to representation were based upon their past work and reputation, and were impartially selected from lists comprising upwards of six hundred names, and including all who are best known in the various branches of art. It was accepted as a principle that no art society would be invited to co-operate as a body, and that "all works would be invited and accepted as the work of individuals, and not as representing any institution; that all exhibits would be under the one head of 'Great Britain.'"

It was also agreed that as the space at international exhibitions is almost invariably restricted, such exhibitions cannot be regarded as suitable occasions at which the younger artists can reasonably expect to make their professional debut.

In order to include the greatest number of works, the committee aimed at inviting a single work by each artist, unless the distinction of such artist, the variety of his work or style, or the relative smallness of his contributions seemed to require the acceptance of more than one.

Invitations to artists to exhibit were issued towards the end of 1899, requesting them to specify two or three works of moderate size only, from which the committee proposed, in the first instance, to select but one. To private owners we intimated that we had been authorised by H.R.H. the President of the Royal Commission, to appeal for the loan of certain works in their possession, stating at the same time that an important international object would be served by their kind co-operation.

The response, both from artists and owners, was the reverse of encouraging, and it became apparent that owing to causes which need not here be referred to, great difficulty would be experienced in obtaining suitable works with which to form a thoroughly good representation of our school, and it is a fact that many artists refused the invitation of the committee for these reasons, among them being several whose works would have lent much additional strength to the collection. Many owners of works of art were no doubt actuated by the same feelings, and declined to lend. The committee had to contend not only with these difficulties, but also with the combined efforts of committees of other exhibitions at home, each of which was working in its own interests.

Notwithstanding these difficulties, the committee have reason to hope that the British art of the last decade received a fairly adequate representation.

The collection consisted of 470 works—(300 in Class 7 (painting), 68 in Class 8 (engraving), 54 in Class 9 (sculpture), and 47 in Class 10 (architecture). The number of exhibitors amounted to 282. At the Paris Exhibition of 1889 the number of exhibitors was 300, and the total number of works exhibited was 550.

The following table sets forth the number of exhibitors and works exhibited in comparison with previous international exhibitions:—

| Exhibition.    | No. of Oil-Paintings. | No. of Water-colours. | No. of Sculpture. | No. of Black and White. | No. of Architectural Drawings. | Total No. of Exhibits. | No. of Exhibitors. | No. of Exhibits per Exhibitor. |
|----------------|-----------------------|-----------------------|-------------------|-------------------------|--------------------------------|------------------------|--------------------|--------------------------------|
| Paris, 1889    | 172                   | 124                   | 40                | 123                     | 93                             | 552                    | 300                | 1'84                           |
| Chicago, 1894  | 461                   | 204                   | 53                | 266                     | 146                            | 1,130                  | 515                | 2'19                           |
| Brussels, 1897 | 205                   | 109                   | 24                | 222                     | 54                             | 614                    | 259                | 2'33                           |
| Paris, 1900    | 166                   | 89                    | 54                | 114                     | 47                             | 470                    | 282                | 1'67                           |

The arrangements concerning the collection of works of art and their packing were confided to Messrs. Dicksee & Co., who sent them in seven consignments, a special officer appointed by the committee travelling with each to insure proper care in handling the cases, &c., on the way. The works in sculpture were numerous, and the majority of them being in plaster, their transport was very difficult and risky. One-half of these were sent in cases and the remainder in vans, the latter method proving to be the more convenient. The transport was given to the London, Brighton and South Coast Railway, in conjunction with the Western Railway of France.

The decoration of the section was entrusted to Messrs. Maple & Co., and the scheme adopted was similar in many respects to that of the French section. The walls were hung with a silky material of a subdued red tone, with the addition of a handsomely decorated Lincrusta frieze, designed by Mr. Norman Shaw. Pediments were fixed to the overdoors, bearing the words "Grande Bretagne." The floors were covered with linoleum, and suitable seats were hired for the period of the Exhibition. The rooms on the corridor were lightly built of wood, and hung with similar material, white muslin forming the ceiling or velarium.

The French officials were most obliging in their efforts to further the interests of the committee, but the fact that they were often unable to respond to our legitimate requests was owing, no doubt, to the involved and complicated nature of their arrangements, and to the confusion which existed.

Although the space promised for sculpture was but 250 square metres, there was much delay in securing even this, and almost up to the last moment it was not known where the sculpture was to be installed.

Nevertheless, the section of painting was ready on the day on which the President of the Republic opened the Exhibition, when he visited the British section. The only other countries similarly prepared were Germany and Austria.

The pictures in the British section were hung by Mr. Val. C. Prinsep, R.A., Mr. W. F. Yeames, R.A., and Mr. J. Lorimer, R.S.A. The sculpture was placed by Mr. H. H. Armstead, R.A. It has already been stated that, even with the addition of the extra corridor rooms, the space devoted to oil-paintings was inadequate; the pictures were therefore somewhat crowded, and many good works had to be placed higher than we desired.

The English catalogue was necessarily arranged in accordance with the French system of numbering, which was not consecutive. It was sold at 50 centimes, and the sale, which was very successful, realised a sufficient amount to approximately cover its cost of publication. The British was the first by several weeks of all the foreign sections to offer its catalogue for sale to the public.

The "Actes Organiques" stipulated that each class jury should elect its own officers, consisting of a president, vice-president, rapporteur and a secretary. The president and vice-president were required to be of different nationalities, the one French and the other a foreigner.

Under this arrangement the following were presidents and vice-presidents of the four sections in the Fine Arts of Juries for awards:—

Class 7, Painting: M. Gerome, president (France); Mr. H. W. B. Davis, R.A., vice-president (Great Britain).

Class 8, Engraving: M. Beraldi, president (France); M. Jacoby, vice-president (Germany).

Class 9, Sculpture: M. Guillaume, president (France); Count Tolstoy, vice-president (Russia).

Class 10, Architecture: M. Vaudremer, president (France); M. Cuypers, vice-president (Holland).

In Class 7 France furnished thirty-nine jurors, and the nineteen other countries twenty-seven.

At extremely short notice given by the Exhibition authorities, the following gentlemen kindly undertook at the request of the committee to represent Great Britain upon the international jury:—

Mr. H. W. B. Davis, R.A., and Mr. W. F. Yeames, R.A., painting.

Mr. Linley Sambourne, engraving and black and white.

Mr. E. Onslow Ford, R.A., sculpture.

Mr. Ernest George, architecture.

It will be noted that a compliment was paid to this country by the appointment of Mr. Davis as vice-president of the class devoted to painting.

In the appendix will be found the able and interesting reports of the above-named gentlemen, but the following remarks upon the work of the jury may be of interest.

Reference has been made to Article 19, which strictly limited the exhibition of works to those executed subsequent to May 1, 1889. The loyalty with which we observed this regulation placed us in a disadvantageous position as compared with other countries which were less scrupulous. In this respect the French authorities seem to have been no less lax by not insisting on the observance of their own regulations.

The judging of pictures commenced on May 30 and was

concluded on July 5, and the decisions of the jury have been accepted as a fair and generous appreciation of our school and of the artists represented.

In sculpture Great Britain showed a larger number of works than she has ever contributed before to any international exhibition abroad; but, inconveniently crowded as was the whole exhibition devoted to sculpture, the exiguous amount of space accorded to our section placed us at a peculiar disadvantage in this respect.

It cannot be said that the contributions in architecture fairly represented the art. Of the hundred architects invited to participate only thirty-six responded, and these did not include all of the best-known practitioners. The drawings were mostly of domestic buildings, work of a higher class being almost entirely unrepresented.

The decisions of the class jury of the fine art section were final, appeals to the group or superior juries being in their case abolished.

Although the British exhibit, as a whole, did not reflect the highest level to which the arts have attained in this country, it was generally admitted to be the best of the foreign sections. As regards the awards, it may be noted that more medals were given to the British than to any other foreign section.

The expenses of the fine art section amounted to 6,018*l.* 3*s.* 8*d.*, being 18*l.* 3*s.* 8*d.* in excess of the estimated expenditure. The finance committee of the Royal Commission originally granted 5,000*l.* towards the expenses of this section, but eventually made a further grant to meet the amount required.

The large number of works in sculpture sent to Paris in 1900 increased the anticipated expenditure under the heading of collecting and packing, and the unfinished condition of the rooms when handed over to us by the authorities considerably increased, as has been explained, the cost of decoration and installation. The expenses of the hanging committee and the jurors also were increased by delays, which were completely beyond our control.

The works were fully insured against all risks, and the rate of premium, viz. 20*s.* per cent., was moderate except in the case of plaster casts. These could not be insured at a lower rate than 90*s.* per cent. It is gratifying to note, however, that no serious damage of any kind has occurred, and that the chief claim upon the underwriters has been for replacing broken picture glasses and injured frames. The latter were all thoroughly repaired before being returned to their owners.

The Exhibition closed on November 12, and the works were completely packed and ready for transport within a fortnight of that date. Through the kindness of Mr. William Forbes, the general manager of the London, Brighton and South Coast Railway, and Mr. T. N. Wylie, the continental traffic manager, who personally rendered us very valuable assistance, our pictures and sculpture were at once sent through to London by passenger trains, and were in the hands of their owners before many of the other foreign sections had begun to leave the Exhibition, and before the rush of departures commenced.

If it had not been for the liberality of many owners of prominent works of art, the fine art section would have been but imperfectly representative of the British School, and the committee wish to express their thanks to those who came forward in response to their request and lent their valuable works in the interests of the country.

To M. E. Molinier, M. André Saglio and M. Barthélémy, of the Palais des Beaux-Arts, we desire to express our recognition for the kind attention shown by them to those whose connection with our section necessitated their presence at Paris.

The thanks of the committee are due to Mr. F. A. Eaton, secretary of the Royal Academy, who voluntarily gave his services as hon. secretary to the fine art committee, and who, by his visits to Paris at the critical time before the opening day, was greatly instrumental in evolving order out of chaos, and in so enabling the committee to have the fine art section ready for the opening ceremony.

To Mr. Isidore Spielmann's untiring energy and devotion to the interests of the committee, both as secretary to the committee at home and as director of the section during his long stay in Paris, is no doubt due a large measure of the success which attended the efforts of the committee.

#### THE METHOD OF JUDGING.

By Mr. H. W. B. Davis, R.A.

In offering the following remarks, which I now have the honour of transmitting to you, as a report upon the proceedings of the International Jury of Fine Arts, Class 7, of the Paris Universal Exhibition, 1900, I must express my regret that they take necessarily the form somewhat of a personal narrative, as unfortunately my colleague, Mr. Yeames, was not able to undertake his duties as juror in Paris until the business of the jury had been very far advanced. There had been much uncertainty as to the probable time of meeting and the duration of the sittings of the jury, and there would appear

indeed to have been some confusion on the part even of the French Administration with respect to the date of its convocation.

I did not myself receive in England the official summons to attend until the day itself of the preliminary meeting of the jury in Paris, and consequently could not be present on that occasion. I arrived in Paris on May 30, and learned the following day that at the late meeting M. G. L. Gerome had been chosen president and myself vice-president of the jury, information I at once communicated to our Commissioner-General in Paris, Colonel Jekyll.

At the first regular meeting of the jury the mode of procedure was discussed and adopted, as well as the method of voting. Some few of the foreign jurors were still absent, but ultimately all arrived and were present at the subsequent sittings.

The jury, including *suppléants*, numbered sixty-six members, of whom thirty-nine were French, no other country being represented by more than two jurors, and the majority of them by one only.

The system of voting by *scrutin de liste* was adopted, in opposition to the wish expressed by some, if not many, of the jurors, French as well as foreign, who were in favour of the more simple method of balloting by black and white balls, which, though possibly a little more tedious in operation, has certainly the advantage of compelling the attention of voters to each individual name that had been proposed and seconded as it came on for consideration, thus at least insuring a vote one way or the other from every juror upon that particular name.

The voting for medals of honour, or grand prix, was to be taken in the first instance. And for this purpose—as was also the case when each of the subsequent class of awards, in the order of their importance, was considered, and after its anterior and superior class had been disposed of—the whole body of the jury was conducted by the President through the various galleries in succession, in the order of the numbering of the rooms; and as two or three of the foreign jurors had not yet arrived, it was decided to visit the French section first, instead of taking, as had been proposed, the various countries in alphabetical order. Before the pictures, it was competent to any juror to propose a work for an award; and it had been decided at the sitting that if the work so proposed should obtain the support of as many as ten of the jury present—but not less—the painter's name should be then and there inscribed by the secretaries upon the list, to be subsequently voted upon by the whole body.

As being significant of the obvious intention of the French authorities this year that there should be no question of the preponderance of French art in the Exhibition, not only as shown in the numerous spacious and imposing galleries—compared with those allotted to foreigners—in which the French works are displayed, but also in the list of awards, and the large number they expected and intended should be obtained by French artists, it may not be quite out of place to point out that on the lithographed form, upon which the names for proposed awards were to be inscribed by the voters, under the headings of the respective nations, the space reserved and allotted to France alone consisted of two pages of the paper, the remaining two pages being allotted, in varying sized spaces, to the countries of the whole of the rest of the world. This intention on the part of the Administration was manifested in several minor ways as well; notably, perhaps, by the manner in which the jurors were at times rather hurried through the foreign rooms. It is obvious that where—as occurred in the majority of cases—the jurors were brought to examine a work seen by most of them for the first time, it would be very difficult for a crowd of sixty and more, clustered round a picture and in a small gallery, to judge efficiently the merits of a work they could only obtain glimpses of; and if, after such a partial examination, the bulk of the jurors were hurried off to another work, sometimes to another room, the result could in many cases hardly prove satisfactory. I am afraid there was a certain amount of impatience—perhaps indifference—displayed at times by some of the French jurors, even by the President, when visiting the foreign sections. But this is by no means to be interpreted as meaning that the French jurors, personally, were ever anything but most courteous, most obliging and apparently well-intentioned and generously disposed towards foreigners.

The impression, however, they made upon me, so far as my own observation went, was that they had not expected, nor perhaps desired, that so many proposals for awards to foreigners should have been made. On the other hand, the proposals, once made and seconded, and inscribed on the secretary's list, were, on the whole, liberally dealt with. And I may here say that, as regards the British section—considering that the display, though very creditable under the circumstances, is certainly but a modest one, and cannot be said to fairly represent the art of the country, many of our exhibitors being represented by a single work, and that sometimes of

minor importance, whilst some of our best artists do not exhibit at all—considering, I say, these circumstances, we have, I think, every reason to be gratified at the result and by the number of awards gained by Great Britain. It is true that those awards were sometimes rather a surprise to my colleague and myself, and were not in some cases quite in accordance with our wishes and our hopes, but such uncertainties and such results are inevitable in international contests of the kind, where the majority of the jurors are always ignorant of the careers of most of the competitors, and, as must be recollected, are only able to form an opinion upon their respective merits by the works, or single work sometimes, they may see before them. It was on these grounds that my colleague and myself, after much anxious consideration, came to the conclusion that we should best consult the dignity of several of our artists, with whose merit and careers we were well acquainted, by withholding their names—that is, not proposing them for an award inferior to that which we felt their careers entitled them to.

We sincerely trust that the committee will hold with us that we came to a right decision, for we are very conscious of the responsibility we took upon ourselves.

It may be well, too, here to call attention to the fact that the first medal (gold medal, so called) is the highest ordinary award in France for any particular work of art, the medal of honour (grand prix) being exceptional, and usually granted in consideration of an artist's whole career, and given at the supposed period of his highest attainment. But the second medal (silver) is considered in Paris a high and important award, and it might, perhaps, be a surprise to some, who may be inclined to look askance at what they may consider a second-class award, that many of the French artists of chief importance—many even of the members of the jury itself, and twice decorated—have never received more than a second medal. Those who have attained to the greatest eminence have usually commenced by gaining a third medal—or an honourable mention, sometimes repeated. They subsequently, as a rule, obtain a second medal and ultimately a first.

After some experience now of universal exhibitions as they regard art (I do not speak of industries), and the methods of awarding medals in connection with them, I have great doubts of the advisability of our entering into competition for awards at all, though I have none whatever as to the value of a nation's participation in the Exhibition, for there can be little question of their importance to students of art, as a means of comparison and education, to say nothing of the extreme interest to art lovers generally of these displays. But I am of opinion that if such contests between nations be entered upon—since contests, however friendly, they seem to be considered—the fact should be faced that it is the manifest duty of the committee charged with the direction of management at home, that they should rigidly and fearlessly exercise their powers of selection of works for the Exhibition, however invidious and sometimes distasteful their task may appear; just as the committee charged with the duty of placing and arranging the works in the space allotted, more particularly if that space be limited, should make it a law to themselves to display them—according to the material at their disposal, and quite irrespective of possible personal bias, or any other consideration—that is, without fear or favour—to the very best advantage, with a view to their possible success in the struggle.

Unless we be prepared to act up to this standard, I think all contest or competition should be declined, as likely to lead to disappointment, if not humiliation, from a national point of view.

It need hardly be necessary to point out that, in fact, these international competitions can rarely result in justice being done to all. Artists of established eminence may very possibly be represented—and not infrequently are—by work of quite minor importance, which may not justify the claims of their authors in the eyes of foreign judges, unacquainted, most probably, with their life's work; whilst, on the other hand, an artist of inferior worth may happen to be represented, on the same occasion, by work of greater effort and attractiveness. This has frequently been the case within my own experience.

The jury held their sittings daily, with the exception of Sundays, until July 5, the date of their last meeting, when, having terminated, on the previous day, their consideration of the last class of awards, honourable mentions, the President declared the work of the jury complete, and the members separated.

The work had certainly been arduous. Besides the enormous number of works in the main galleries of what is called Le Grand Palais, every pavilion of the various nations and of the various colonies, as well as every establishment within the precincts of the Exhibition, containing any painting—mural or other—or any object of art entering under Class 7, had been visited, and the works examined, in the first instance, by a sub-committee of four delegated by the jury, consisting of the vice-president and three others (two French and two foreign), to report upon such works, and subsequently by the whole body of the jury.

At one period of the sittings a collapse of the jury threatened to occur, owing to a divergence of views with the Administration with regard to the awards. A communication from the authorities was addressed, through the President, to the jury, notifying that, according to the official view of the regulations, the awards of the jury were to be considered as provisional only, and might be reconsidered and possibly modified by the group and the superior juries, whose decisions were to be final. This proposal to interfere with the strict functions of the jury at once met with strenuous opposition, and was much resented when it appeared that the Administration was indisposed to withdraw its pretension. After a warm discussion, it was almost unanimously decided that unless the Administration gave a guarantee that the awards of the jury should in no wise be tampered with—that is, that they should neither be added to nor restricted (with the exception of any proved cases of error or forgetfulness)—the jurors would one and all give in their resignations, and that, in the meantime, pending the decision of the authorities upon the question, they would suspend their sittings.

The matter was subsequently arranged at an interview of the President of the jury and the Commissaire-Général of the Exhibition, the latter giving the required undertaking, and the jury resumed their deliberations.

Almost at the last sitting also there was danger of disruption before completion of the work. A motion was made by one of the French jurors and supported by some others, with the object of reconsidering the awards and obtaining an addition to the number of first medals, and possibly of grand prix, as well as a definite proposal on the part of the Administration of one grand prix to a country that had not succeeded in obtaining one. These, like the former proposal of the Administration, met with no success, and had to be abandoned, after some rather exciting scenes.

I may add that the relations between all sections of the jury, particularly between the foreign members and their French colleagues, were throughout of the most pleasant and cordial nature.

#### PAINTINGS.

*By Mr. W. F. Yeames, R.A.*

In reviewing the work done by the jurors in the sections devoted to painting, sculpture and architecture, one cannot help asking oneself whether in the interest of the fine arts it is advisable to bestow awards on works of art, and how far it is possible to do so fairly.

The fluctuations of fashion and of individual taste give a decided bias to all judgments passed on the merits of paintings by living artists, and the history of art teaches us that time alone can settle what position an artist deservedly holds in the world's estimation.

What one could not help noticing with the French and most of the other continental nations, whose art is an outcome of the French school, was a craving for novelty, for everything out of the common, and this at all cost and at the expense of many of the traditions of good art as upheld for centuries in the past.

Again, an unreasonable war is waged at present in France against any production in which the influence of photography can in any way be detected, in consequence of which precise drawing and sound light and shade serve frequently to condemn a picture; and, on the other hand, extravagance of all kinds is admired in works lacking in drawing, proportion and other qualities appealing to common sense. These views, if admitted, will explain how in the British section, in many cases, awards were bestowed on pictures and withheld from others very much against the estimation in which their authors are held in this country.

The mode of proceeding and the machinery adopted were too cumbersome to secure a very satisfactory result. The jurors being over sixty in number, it was not possible to have that interchange of opinion required in judging a work, and the number of pictures to be dealt with was so great that the necessary time could not be given for deliberate discussion of their merits.

For each class of medals, the médaille d'honneur, the gold medal, the silver and the bronze, a separate visit was made to all the galleries, both French and foreign, the President leading the jurors and submitting to them any work proposed by any juror for a medal. A show of ten hands carried the picture, entitling the author's name to be put on the list eventually to be voted upon.

This list was then lithographed, and a copy given to each juror, whose duty it was to strike out all the names except those of the artists he desired to have the medal. Scrutineers chosen from the jurors then counted the number of votes given to each name, and twenty-seven votes secured a medal.

Much to my regret, I was unable to attend the meetings of the jurors for the médaille d'honneur and the gold medal, but attended all the others. Owing to the large number of jurors, the President had much difficulty in gathering them round each

picture, but consistently let everyone who wished express his views, and reconsidered a decision if urged to do so by a juror. In going round the British and other foreign sections, no change could be detected in the mode of proceeding, and the impression left on my mind was that the bulk of the jurors were desirous to act fairly in their judgment of the pictures of whatever nationality.

With respect to the last awards, the honourable mentions, the committee decided that the French jurors should appoint four or five of their number to visit again the galleries of the French section, and make out a list of those who, having not yet received awards, were still entitled to honourable mention; and that the jurors of the other nationalities, two in some cases and one in others, should in their respective sections make out similar lists, these lists to be submitted to the whole jury and voted upon. Eventually, as the lists thus made out were not considered excessive, they were adopted in their entirety.

As must have been expected, the French section obtained a very large number of awards, somewhat excessive.

The British, though getting a largish number, might have had more but for two circumstances—the one, that many of our distinguished artists were not represented by their best works; and the other, that owing to insufficient room being given for their display, their pictures could not be exhibited to the best advantage.

A cordial feeling existed amongst the jurors, and Mr. H. W. B. Davis, R.A., being elected vice-president was an expression of the esteem the art of this country is held in in France. In the hubbub and general talk that attended most of the deliberations, it was noticeable that when Mr. Davis spoke silence ensued, and due attention was always given to his words. He was enabled by this to pull the committee through several serious difficulties it got into through ungovernable hastiness and excitability.

Though acknowledging that the work done by the jury was not as satisfactory as could have been wished, I doubt whether better results would have been secured by other methods and expedients.

#### SCULPTURE.

*By Mr. E. Onslow Ford, R.A.*

In opening my report as juror for the British Section in Class 9 (Sculpture) at the Paris Exhibition of 1900, it is necessary for me first of all to deal with the size of our exhibit, and I regret to say that in this respect I cannot speak of it with the satisfaction I could have wished. For without doubt in this respect it fell considerably below what had been anticipated. When the committee began to organise their collection they were encouraged by the promise that 250 square metres would be allotted to them at the Exhibition; but when the actual division of space occurred it was apparently found impossible to assign anything like the full amount to the British department, and from this fact it resulted not only that the numbers had to be cut down considerably below the amount contemplated, but the works exhibited had to be packed into so small a space that it was quite impossible to show them off to full advantage. Our grounds of complaint, however, cannot be legitimately laid at the door of the French committee, for we must in justice to them say that their own department was hampered by the same conditions, and their own exhibits were so crowded as to preclude all possibility of a really effective arrangement of the works shown. The British Section was made up of thirty-three small and twenty-one large works. In addition to the crowding, the Exhibition lost much by the absence of the works of several notable artists. But the committee had to cope with a further difficulty, occasioned by the large proportion of works which were sent in in plaster. Out of a total of exhibits of fifty-four only five were of marble and twenty-five of bronze, all the rest being plaster. The difficulty of transport of the latter material is necessarily very much greater than that of stronger materials, and owing to its fragile nature the charge for insurance reaches the very high figure of 90s. per cent., as compared to 30s. for bronze. In this way the expenses are trebled at the outset, with no compensating advantage, and this initial loss is such as to make impossible an adequate collection of works on the present system. In future a great effort will have to be made to procure works in their permanent form. No doubt sympathies are due to the private owner who is asked to lend works from his collection, but I think it must be called disappointing that when we are asked to put forward a representative collection of British works extending over a period of ten years the majority of those works should have to be in plaster. To make a comparison between the works exhibited by France and those of other countries would under the circumstances be unfair and misleading, for whereas French sculpture was fully represented, the same cannot be said of the collection of any other country. We especially suffered in this respect, as owing to want of space no one individual was given an opportunity of exhibiting all phases of his work, as was the case with some of the leading

men of other countries. In the Spanish, Russian and German sections there were undoubtedly a few things which lent dignity and distinction to the Exhibition, but, as I have said, the imperfect collections of the foreign countries make a true comparison out of the question. Numbers may speak for themselves, and I have only to say that France claimed about 1,000 exhibits out of a total of 2,000 to show how much greater was her opportunity of showing every side and quality of her art. Had we had more room allotted to us we might have made our school more assertive, and have been enabled to display a more striking and comprehensive collection of British sculpture. Though a direct comparison would thus be impossible, some general remarks might not be out of place. The modern tendency in art seems to lead towards unrest, and the British school appears to have been less affected by this tendency than has been the case with the schools of other nations. The mere physical labour of the judging was arduous in the extreme, as may easily be imagined when it is remembered there were somewhere about 2,000 works, and that a great number of these were scattered about the grounds and upon the outside of the buildings, including such objects as bridges and architectural decorations. This necessitated much walking in all weathers and temperatures. Each work, moreover, had to be examined and marked in the catalogue, and weighed according to its own merits. It is not surprising, then, that the judging should have occupied the time of three weeks, and including the voting, exactly a month. The judging throughout was carried out with the utmost fairness and impartiality, and wherever anyone was impressed with too much or too little zeal in the cause of his own country, the fact was invariably discovered and set right by some members of the jury. With regard to our own section, I have every reason to be satisfied in the matter of awards. The home section comprised fifty-four exhibits, the work of twenty-three artists, but of the twenty-three, Mr. Bates, deceased, received no recompense, and one work, being more than ten years old, stood outside the competition, as, of course, did those of myself, as being a member of the jury. There were then only twenty serious competitors, and twenty awards were made. In addition to these, four awards were also given to Canada and India.

Without doubt the success of the proceedings was very largely due to the president, M. Guillaume. Owing to his unflinching tact the most perfect harmony prevailed throughout the whole work. While delightful to all, I am indebted to him myself for very many personal attentions, and may say with my fellow-jurors that I consider it a great privilege to be a member of a committee acting under his guidance.

An Exhibition of this size cannot pass by without its lessons, and with a view to future participation in international exhibitions a few suggestions might be offered. Speaking as a sculptor I may say that it is of great importance that notice should be given to the exhibitors at least a year before the exhibition, and in order to secure the fuller co-operation of private owners a printed letter might be given to each sculptor for use in applying for the loan of his works, as in this way a greater authority would be lent to the request, and owners would be made to feel more strongly that it is a question of national concern that English art should not be handicapped more than possible in showing off its true qualities in competition with the work of other countries.

These expedients, coupled with a more liberal grant of funds than on the present occasion, which would enable the committee to act with a freer hand, would insure a fuller and more representative exhibition of British sculpture than any that has yet been seen abroad.

#### ARCHITECTURE.

By Mr. Ernest George, F.R.I.B.A.

Having been privileged to serve as a juror on the art section of the Paris Exhibition, I make the following comments upon my department, Architecture.

It was disappointing to find the contribution of architectural drawings from Great Britain to be small, and to consist for the most part of unimportant works, not fairly representing British art. The list of exhibitors contains but thirty-six names, and in this list several of our leading architects are not to be found, while one or two men have sent drawings hardly supporting their deserved reputation.

Our exhibited drawings are mostly examples of domestic buildings, and our foreign critics give us higher praise for this branch of work than for our civic or public buildings. Architecture is less erratic and more traditional in France than in England, but when a Frenchman forsakes his classical lines there is commonly less restraint and propriety and less of a pleasant homeliness than in our own country work. The English country house has more comeliness and comfort than the average *maison de campagne*.

An architectural exhibition will never claim public interest as will exhibitions of the sister arts. The painter and sculptor show their completed works, while the architect's buildings are only explained by diagrams, and it is undesirable that these

drawings should become pretty pictures or works of art in themselves.

In the group of *Grande Bretagne* there are mostly line drawings, while in the *Etats Unis* adjoining it is interesting to find architecture represented only by photographs of executed works. These, while making a modest display, seem to us to make the most reliable statement of the present position of architecture in America.

The German architectural exhibits are few, but they represent municipal buildings and churches drawn and coloured to a large scale and handsomely framed, as if the picture, rather than the building, were the ultimate end.

France presents many works of interest; there is much art in the tinting of the drawings, which are frequently on a grand scale.

There are many archaeological studies working out the problem of restoring ancient cities or temples, reconstructing them from the fragments still to be found. These show a deep and patient research into ancient art that is hardly practised with us, our training being of a more limited and utilitarian character. Our own students have given equally close study to Mediæval examples, the Early Renaissance and to subsequent styles, and I venture to think that in our revival or adaptation of the French, the Flemish, or particularly the Dutch types, our own application or reproduction of these is more satisfactory than the prevailing modern work in the countries that gave birth to these styles.

I believe that from our best hands the spirit and refinement of the old work is often attained, which in continental modern work is so frequently missed.

We have shown the difficulty of judging architecture from drawings and diagrams, and it is pleasant to turn from these latter to a few examples of the art realised in stone (or its substitute).

There is a Rue des Nations, where harmony is less possible than in a concert of European Powers. The effect of all the styles being brought into one street is necessarily bizarre, but perhaps the most reposeful building is the English Royal Pavilion, of which Edwin L. Lutyens is the able architect.

It is a small but charming country house founded upon a Wiltshire type and cleverly carried out.

The interior, with its oak panelled walls, good chimney-pieces and fine parquet ceilings, receives a further refining influence from the Sir Joshuas, Romneys and other choice pictures of the English school, kindly lent by their owners, and a source of interest to foreigners, who know too little of our English masters.

In this pavilion we only regret the needless red-brick chimney-stacks on its corners and set upon the stone wall; had these chimneys grown naturally out of the roof, we could have excused their being of brick.

The first impression given by this English manor house is of its being petite. It is no doubt out of scale with its surroundings, which have been growing up with it. We desire to see horizontal lines, terraces and yew hedges about our building, instead of the soaring lines of the Oudenarde Rathaus in its close proximity, but this difficulty was inevitable.

Another English building of interest, thoroughly original and with a distinct charm of scheme and proportion, is the pavilion of the Peninsular and Oriental Steamboat Company, by T. E. Collcutt. Its low dome is pleasant both from inside and outside, and it works off the square plan very happily. It has simplicity of line and is without ornament but for the low-relief modellings by Lynn Jenkins and Moira.

Another English architect, Mr. Charles Clowes, is answerable for the Anglo-Indian and Ceylon buildings, where the Oriental treatment is cleverly adapted to the needs of the several structures.

With regard to the medals bestowed on the section of British architecture, in which half the number of exhibitors receive distinctions, my opinion is that we owe as much to the generosity and kindly feeling of the jury as to the merits of the works exhibited.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

AT a meeting of the Council of the Edinburgh Architectural Association, Mr. Henry F. Kerr, president, in the chair, the immediately impending demolition of the Ionic portico to Parliament Square was under consideration. This portico was designed nearly a century ago by Elliott, and is in great part a transcript of the famous portico of the Erechtheum at Athens. It is undoubtedly a fine work, and of commanding scale, and as an example of the Ionic order in its richest development is of great importance. The base and the entablature have original features of individual interest and value. Perhaps the excellence of its design and the beauty of its material and masonry would have been more generally appreciated had it faced another aspect than the east, where the due effect of light and shade from

the sunlight can only fully be seen in the early morning. The Council of the Association, fully acknowledging the merit of this piece of architecture—one of the very few remaining works of such scale and excellence—unanimously resolved to express deep regret at the possibility of its being lost to the city of Edinburgh, and the earnest hope that in some way it may yet be saved. Assuming that the portico cannot be retained in its present position, the Council is of opinion that within the confines of the municipality a place and a use could be found for it, so that it may continue to be an ornament of the city. The Council is strongly of opinion that the destruction of this noble portico would be not only a civic, but to a great degree a national loss, and in this age of consideration for all things worthy of repute, it would be an irretrievable disgrace if the stones were allowed to be broken up.

### TESSERÆ.

#### Tibaldi and Michel Angelo.

OF the imitators of Michel Angelo, the two most eminent are Pellegrino Tibaldi, called "Michel Angelo riformato" by the Bolognese eclectics, and Francesco Mazzuoli, called Parmigiano. Pellegrino Tibaldi penetrated the technic without the moral principle of his master's style; he had often grandeur of line without sublimity of conception; hence the manner of Michel Angelo is frequently the style of Pellegrino Tibaldi. Conglobation and eccentricity, an aggregate of convexities suddenly broken by rectangular, or cut by perpendicular lines, compose his system. His fame principally rests on the frescoes of the Academic Institute at Bologna and the ceiling of the Merchants' Hall at Ancona. It is probably on the strength of those that the Carracci, his countrymen, are said to have called him their "Michel Angelo riformato"—Michel Angelo corrected. It would be injustice to the Carracci to suppose for one moment they could allude by this verdict to the ceiling and the prophets and sibyls of the Capella Sistina; they glanced perhaps at the technic exuberance of the Last Judgment and the senile caprices of the Capella Paolina. These, they meant to inform us, had been pruned, regulated and reformed by Pellegrino Tibaldi. Do his works in all places warrant this verdict? So far from it they exhibit little more than the dotage of Michel Angelo. The single figures, groups and compositions of the Institute present a singular mixture of extraordinary vigour and puerile imbecility of conception, of character and caricature, of style and manner. The figure of Polyphemus groping at the mouth of his cave for Ulysses, and the composition of Æolus granting to Ulysses favourable winds, are striking instances of both. Than the Cyclops, Michel Angelo himself never conceived a form of savage energy, provoked by sufferings and revenge, with attitude and limbs more in unison; whilst the God of Winds is degraded to the scanty and ludicrous semblance of Thersites, and Ulysses with his companions travestied by the semi-barbarous look and costume of the age of Constantine or Attila. From Pellegrino Tibaldi the Germans, Dutch and Flemings, Hemskerck, Goltzius and Spranger, borrowed the compendium of the great Tuscan's peculiarities, dropsied the forms of vigour, or dressed the gewgaws of children in colossal shapes. Parmigiano poised his line between the grace of Correggio and the energy of Michel Angelo, and from contrast produced elegance, but instead of making propriety her measure, degraded her to affectation. That disengaged play of delicate forms, the "sveltezza" of the Italians, is the prerogative of Parmigiano, though nearly always obtained at the expense of proportion. He conceived the variety, but not the simplicity of beauty, and drove contrast to extravagance.

#### Florentine Reliefs.

Various degrees of relief, background figures and objects and occasional attempts at perspective are to be found in the works of the Pisani and their scholars; yet their works, which are to be regarded as the infancy of Italian art, and which undoubtedly are rude enough in workmanship and imitation, are purer in style than those of the succeeding Florentine masters who attained so much general perfection in sculpture. The rilievi of Donatello are mostly in the style called by the Italians stacciato, the flattest kind of mezzo-rilievo, according to the definition before given, which he probably adopted as he worked in bronze from the facility of casting; yet in such a style, commanding little distinctness from its inconsiderable projection, he introduced buildings, landscape and the usual accessories of a picture. But this misapplication of ingenuity was carried still further by Lorenzo Ghiberti in the celebrated bronze doors of the Baptistery, or church of San Giovanni, at Florence, which exhibited such skilful compositions, in which the stories are so well told and in which the single figures are so full of appropriate action. In these works the figures gradually emerge from the stacciato style to alto-rilievo. They are among the best specimens of that mixed style, or union of

basso-rilievo with the principles of painting, which the sculptors of the fifteenth century and their imitators imagined to be an improvement on the well-considered simplicity of the ancients. In these and similar specimens the unreal forms of perspective buildings, and diminished or foreshortened figures, which in pictures create illusion when aided by appropriate light and shade and variety of hue are unintelligible or distorted in a real material, where it is immediately evident that the objects are all on the same solid plane. Even Vasari, who wrote when this mixed style of rilievo was generally practised, remarks the absurdity of representing the plane on which the figures stand ascending towards the horizon, according to the laws of perspective.

#### Aids to Invention.

He who wishes to be a painter or a poet must, like Imlac, enlarge his sphere of attention, keep his fancy ever on the wing and overlook no kind of knowledge. He must range deserts and mountains for images, picture upon his mind every tree of the forest and flower of the valley, observe the crags of the rock and the pinnacles of the palace, follow the windings of the rivulet and watch the changes of the clouds; in short, all nature, savage or civilised, animate or inanimate, the plants of the garden, the animals of the wood, the minerals of the earth and the meteors of the sky, must undergo his examination. To a painter or poet nothing can be useless: whatever is great, whatever is beautiful, whatever is interesting and whatever is dreadful must be familiar to his imagination, and concur to store his mind with an inexhaustible variety of ideas, ready for association on every possible occasion to embellish sentiment and give effect to truth. It is, moreover, absolutely requisite that man, the epitome of all, his principal subject and his judge, should become a particular object of his investigation. He must be acquainted with all that is characteristic and beautiful, both in regard to his mental and bodily endowments, must study their analogies, and learn how far moral and physical excellence are connected and dependent one on the other. He must, further, observe the power of the passions in all their combinations and trace their changes, as modified by constitution, or by the accidental influences of climate or custom, from the sprightliness of infancy to the despondence of decrepitude. He must be familiar with all the modes of life, and, above all, endeavour to discriminate the essential from the accidental, to divest himself of the prejudices of his own age and country, and, disregarding temporary fashions and local taste, learn to see nature and beauty in the abstract, and rise to general and transcendental truth, which will always be the same. Nor is his labour yet at an end. To the study of nature he must also join that of art, and enrich his mind by the contemplation of all the treasures produced by it in ancient and modern times, tracing its progress from its rudest infancy to its ultimate perfection, not contenting himself with a superficial survey, but studying attentively the peculiar manner of each master, dwelling on all their successful efforts, scrutinising all their defects, observing all their beautiful thoughts, inquiring whence they were derived, with what connected and how far founded in nature; entering into all the artifices of their compositions and comparing their different modes of execution and arrangement, till he penetrates and develops the principles on which their most splendid effects are produced.

#### The Architectonic in Sculpture and Painting.

Flaxman understood the principle of the sublime in sculpture—namely, the architectonic—much better than his English brethren who, indeed, seem not to understand it at all, or understand everything about it save its application. How little they observe or regard it may be seen in a side-chapel of Westminster Abbey; here the beautiful architectonic *coup-d'œil* is sacrificed to a single statue—that of Watt, who, seated on a ponderous block, which thrusts its diagonal awkwardly and obtrusively across the floor, receives the visitor with his back and presents to the church itself a hillock of shoulder. What occasioned the artist thus to break up the whole ordonnance of the chapel by so positing his work—a work, too, though admirable *per se*, as ill-proportioned to its Gothic cage as a lion to a show-box—must have been, we surmise, that the architectonic principle was not enough felt; in other words, the statue was made the predominant, not the subservient consideration—independent of, not co-operative with the architecture, and all general effect, appropriateness, decorum, set at nought for the sake of a favourable light upon Watt's physiognomy. Infringement of the architectonic principle has long been the law of the Abbey, but there is a monopolising spirit about this statue which renders it still more offensive. The Mansfield Monument exhibits better taste, though its circular forms redouble the impropriety of a Classic memorial under a Pointed structure. Canova's pyramid to the Christina Monument at Vienna assimilates more with the Pointed church it stands in; even Thorwaldsen's Peruginesque ordonnance for his great work at St. Peter's,

Rome, were a preferable model, if our cathedral sculpture must remain anti-Gothic. Not to speak of the Parthenon and other templar statuary among the Grecians, what a much truer instinct than we as regards this said principle had the primitive Middle Age painters—*e.g.* Perugino, Van Eyck, Wohlgemuth—whose formal perpendicularity and severe parallelism of composition, however disagreeable when their altar-pieces are seen in drawing-rooms, fitted them with marvellous accord to their proper recesses in churches, of which they miniaturized the dominant forms, and preserved the rectilinear austerity down to the uttermost detail and very decorations. Nay, how much deeper were our own old Gothic statue-makers penetrated by a sense of the architectonic principle than the modern—how much sublimer their inspiration, as well as more scientific their art. Look at their knights stretched lengthwise, sword at side and leopard at feet, their saints and solemn kings standing upright in niches, their priests kneeling, their ladies slumbering in fluted rochets or fardingales—all the attitudes, however stiff, all the lines, however ornamental, strictly architectonic, strictly harmonising with the general character of the edifice that encloses them. Hence arises the one undisturbed, overwhelming impressiveness of a Gothic cathedral, when permitted to retain even the ruinous integrity which time may have left it. But when our pseudo-Classic artists have leave to fritter away this grand effect with importunate statues, which seem to declare the cathedral meant, like a garden house for plants, to shelter them, not themselves to enrich it, sculpture becomes a most selfish art, and a disfigurer of that architecture it pretends to adorn.

#### The Ideal in Painting.

The ideal, as a general principle, and not confined to form merely, is a principle so natural that the most untaught sign-painter paints his sky with the brightest blue, and his fields and trees with the most vivid green he can procure, though he well knows he is exceeding the colour of nature. But his notion is that a picture must be an improvement on nature—a notion always preceding the true settlement of what constitutes the ideal, namely, a selection from and a combination of the beauties of nature as the only means by which art can compensate for its unavoidable shortcomings. "We cannot," said Sir Thomas Lawrence, "compete with nature in the exquisite beauties she everywhere offers us, or in the minute delicacies of her finish; our only chance is in selection and combination." The ideal is conceived to be not only the result of an inborn inspiration of all taste, but it is the sole condition of the very existence of art, and therefore where there is no selection, or where the selection is not under the guidance of judgment, there may be very good painting, as far as it is merely copy, but there can be no art; and it should be impressed on the student that though a good painter or copyist of nature may obtain immediate fame, yet, unless he can rise to the rank of an artist, he will not outlive his generation, for the ideal is the poetic element by which, properly understood, and not by any classification of subject, high art is distinguished from low or ordinary art. This principle is far from being confined to the beautiful or the perfect, for the humpbacked and near-sighted sibyl of Michel Angelo is conceived in as great a style as anything by his hand; and Hogarth, in his own subjects, is as ideal as Raphael, because every face and form there was well chosen for what he meant to express, as are the faces and forms of Raphael.

#### Wood Engravings of Maps.

Notwithstanding the disadvantage under which the ancient wood engravers laboured in the execution of maps, they for many years contended with the copper-plate printers for a share of this branch of business, and the printers at whose presses maps engraved on wood only could be printed were well inclined to support the wood engravers. In a folio edition of Ptolemy, printed at Venice in 1511 by Jacobus Pentius de Leucho, the outlines of the maps, with the indications of the mountains and rivers, are cut on wood, and the names of the places are printed in type of different sizes and with red and black ink. For instance, in the map of Britain—which is more correct than any which had previously appeared—the word "Albion" is printed in large capitals, and the word "Gadini" in small capitals, and both with red ink. The word "Curia" and "Bremenium" are printed in small Roman characters, and with black ink. The names of the rivers are also in small Roman and in black ink. Such of those maps as contain many names are almost full of type. The double borders surrounding them, within which the degrees of latitude are marked, appear to have been formed of separate pieces of metal in the manner of wide double rules. At the head of several of the maps there are figures of animals emblematic of the country. In the first map of Africa there are two parrots; in the second an animal like a jackal, and a nondescript; in the third, containing Egypt, a crocodile and a monstrous kind of fish like a

dragon; and in the fourth two parrots. In the last the "curious observer" will note a specimen of decorative printing from two blocks of wood, for the beak, wing and tail of one of the parrots is printed in red. In the last map—of Loraine—in an edition of Ptolemy in folio, printed at Strasburg in 1513 by John Schott, the attempt to print in colours in the manner of chiaroscuro wood engravings is carried yet further. The hills and woods are printed green; the indications of towns and cities and the names of the most considerable places are red, while the names of the smaller places are black. For this map, executed in three colours, green, red and black, there would be required two wood engravings and two formes of type, each of which would have to be separately printed. The arms, which form a border to the map, are printed in their proper heraldic colours.

#### Scottish Architecture.

A very distinguishing feature of Scottish architecture is the jutting lines—lines breaking all over the building, and, in attempting to analyse the design, it is difficult to tell whether the perpendicular or horizontal line of composition prevails. These lines are often exceedingly picturesque, and are to be found wherever we get a building on an irregular site. Like the bead moulding and the chamfer, they are common to all periods, and the baronial mansion took it from ecclesiastical buildings. An early specimen of these economic decorations is seen at the Nunnery of Iona. There is a play of line about them, and an artistic effect which there is no mistaking. Again, at Dryburgh, which is rather more recent than Iona, there is a capital illustration of the design suiting itself to the rising of the ground entirely by means of broken lines. The old Scottish buildings seem really to take root in the soil. Nothing can be more remarkable in the irregularity of their plans than the old Scottish churches. They are, so far as churches can be changed, as varied as castles, and all of them depend on the ground for the distribution of their parts. While Melrose Abbey is nearly all nave, Kelso Abbey is nearly all choir, though the latter peculiarity has given rise to the idea that at Kelso, as at York and Lincoln, there must have been originally a double transept. Elgin Cathedral has five divisions, while Melrose Abbey has but four; some have three, and some only two, while some are without divisions. And in the Tweed buildings in particular it is not only in the plans of the churches that the architects seem to have scorned uniformity, but even in the very details. In the clerestory of Dryburgh Abbey one arch in the series is 2 feet below the others, for no reason that can be perceived but that the architect had a contempt for symmetry.

#### Roman Shops.

By Ulpian "Taberna" is defined as any kind of building fit to dwell in, "*nempe ex eo, quod tabulis clauditur*," or, according to the more probable etymology of Festus, because it was made of planks. The latter asserts that this was the most ancient kind of abode used among the Romans, and that it was from the early use of such dwellings that the words *taberna* and *tabernaculum* were applied to military tents, though the latter were constructed of skins. We know very little of the form and materials of the ancient tents, but we may infer from the notices we have of them that they were generally composed of a covering of skins partly supported by wooden props and partly stretched on ropes. Sometimes in a permanent camp they may have been constructed entirely of planks, and sometimes in cases of emergency garments and rushes were spread over any support that could be obtained. From *taberna*, when used in this sense, are derived *tabernaculum*, the more common name of a tent, and *contubernales*. The usual meaning of *taberna* is a shop. Neither the ancient authors nor the remains of Pompeii lead us to suppose that tradesmen often had their shops forming part of their houses, as with us. A few houses are, indeed, found at Pompeii entirely devoted to the purposes of trade, consisting, that is, of the shop and the rooms occupied by the tradesman and his family. Most commonly the shops formed a part of a large house, to the owner of which they belonged, and were by him let out to tradesmen. Some of the shops round a house were retained by the owner for the sale of the produce of his estates. This arrangement of the shops was probably an improvement on an older plan of placing them against the walls of houses. Even under the emperors we find that shops were built out so far into the street as to obstruct the thoroughfare. Martial mentions an edict of Domitian by which this practice was put down and the shops were confined within the areas of the houses. The following are the most remarkable classes of shops of which we have notices or remains:—  
1. Shops for the sale of wine, hot drinks and ready-dressed meat. 2. Bakers' shops. Of these several have been found at Pompeii containing the mill as well as the other implements for making bread. 3. Booksellers' shops. 4. Barbers and hairdressers' shops.

### ASSISTANT COUNTY SURVEYORS IN IRELAND.

**A**N inquiry was held in Omagh by Mr. P. C. Cowan, chief engineering inspector Local Government Board, respecting a difference of opinion which has arisen between the County Council and the assistant county surveyors as to the remuneration to which the assistant surveyors are entitled for increased duties cast on them under the Local Government Act. The assistant surveyors were paid 80% a year each under the Grand Jury system, and the County Council had offered to increase the sum to 100% a year, but the assistant surveyors claimed 150% a year each, together with reasonable travelling expenses. The Local Government Board was therefore asked to decide what should be paid.

After hearing evidence, the Inspector said the expenditure on works in the county was somewhere about 40,000% a year. A large amount of discretion was, of course, placed in the hands of the assistant surveyors, and owing to the nature of their duties they must be men who could be relied on for the conscientious and fearless discharge of their duty as between the contractors and those who paid the contractors—the ratepayers. Thousands of pounds' worth of work and material depended on the certificate of these men, and yet the remuneration they were to receive was only the wages usually paid to an ordinary mason. Of course, it was entirely a matter for the ratepayers, and if they thought they could get this class of work done for the sum they offered that was their own look-out; but there could be no more shortsighted policy than that of having in a responsible position an official who felt that he was shabbily treated by his employers. He regretted that the members of the County Council had not attended the inquiry, so that they might discuss this matter in a reasonable and amicable way with the view of doing what was best for the persons who were most vitally concerned, namely those who had to provide for the up-keep of the county works. Of course, so far as the Local Government Board was concerned they simply desired to act impartially with a view to the efficient discharge of the county business. He knew that a great many persons thought the county expenditure was too great, and their first idea on entering office was to cut down the salaries of their officers, but there was a serious question whether that was conducive to economy in the long run.

The Inspector said he would submit his report to the Local Government Board in due course.

### GENERAL.

**Mr. Harry Ellis Wooldridge, M.A.**, has been re-elected to the Oxford Slade Professorship of Fine Art. Mr. Wooldridge was elected Slade Professor in 1895 and re-elected in 1898, so that this will be his third term of office.

**The First Commissioner of Works** has stated that no arrangements have yet been made for preparing Westminster Abbey for the Coronation. The Dean and Chapter and their architect will not retain any control over the structure of the Abbey during the progress of the works, as they will be undertaken by the Office of Works.

**M. Harpignies**, the French landscape-painter, has been raised to the rank of Commander of the Legion of Honour.

**The New Zealand Government** are urging upon Mr. Chamberlain the establishment, as a memorial to the late Queen Victoria, of a national technical university in London, where the youths of the Empire might be trained in all that science, art and industry can accomplish to make commercial enterprise successful.

**The Hon. G. W. Ross**, Premier of Ontario, has placed a commission with Mr. M. Raggi, sculptor, for a statue of the late Queen, which will be cast in bronze and erected in Toronto in the early spring.

**The London County Council** are about to issue an advertisement inviting applications for the appointment of chief engineer of the Council at a salary of 2,000% a year, in the place of Sir A. Binnie, resigned.

**The Cambrian Archæological Association** will hold their annual meeting at Newtown from July 29 to August 3. The president-elect, Colonel Pryce-Jones, M.P., will deliver the opening address.

**The National Competition Works** by students of the art schools of the Board of Education will be exhibited in the iron building "C" behind the Natural History Museum until August 31.

**A Meeting** of the British Archæological Association has been held in Nottingham during this week under the presidency of Lord Hawkesbury.

**A New Church** is about to be erected at East Kirby, Notts, from the designs of Mr. Lewis Ambler. The style is early fifteenth century. The cost at first will be about 5,000%.

**A Contract** has been entered into for a school and conventual buildings to be erected at Bishop's Stortford at a cost of 5,000%.

**The Memorial-Stone** of a new church at Leeds was laid on Saturday. The site was secured for between 8,000% and 9,000%, and the church and schoolroom will be erected from the designs of Mr. C. F. Danby, and will cost 13,000%.

**The British Institution** of Heating and Ventilating Engineers held their summer meeting in Dublin last Tuesday and Wednesday.

**The House of Commons** has sanctioned the payment out of the Consolidated Fund of any expenses which might be incurred by the Office of Works for the acquisition of three or four buildings in Pall Mall in order to secure complete isolation on the western side for the National Gallery to protect it from fire.

**Mr. George Miles**, of the Lord Chamberlain's Office, has been appointed Inspector of Windsor Castle, in succession to Mr. Leonard Collmann. Mr. Miles has been about twenty-eight years in the Royal service.

**The Archbishop of Canterbury** took part on Tuesday in the dedication services at St. Ninian's Cathedral, Perth, which has been restored at a cost of 13,000%. The chapter-house has been built as a memorial of Bishop Charles Wordsworth.

**Mr. Y. Nakajima**, engineer of the Tokio waterworks, will spend about a year in studying municipal works in the United States and Europe. He expects to leave Japan in about a month, and will first visit the former country.

**An Exhibition** of French art is to be held at Helsingfors, in Finland. There is a school of native art from which several interesting works were contributed to the Paris Exhibition of 1900.

**A Retrospective Exhibition** of the wood engraver's art is now being arranged, and will shortly be opened at the Ecole des Beaux-Arts, Paris.

**An Architectural Association** has been formed for Wolverhampton and district. The president is Mr. J. Lavender, F.R.I.B.A., and the honorary secretary Mr. W. Edwards. The members are to be duly qualified architects who have been in actual practice for at least two years. There will be also associates and honorary members.

**Plans** have been drawn up and will be laid before the Egyptian Government in the autumn with a view to carrying out a scheme which experts consider would undoubtedly preserve the famous temples at Philæ from the possibility of being submerged at the completion of the Nile dam at Assouan.

**M. Cavel** is the architect entrusted with the enlargement of the Paris Bourse. Numerous commissions of architects and archæologists have in vain protested against the alteration of Brongniart's great work. Operations were begun on Monday for the addition of lateral wings, thus making the building cruciform. The architect hopes to have the work completed about the end of 1903.

**The Last Meeting** of the present session of the Incorporated Society for Promoting the Enlargement, Building and Repairing of Churches and Chapels was held on the 18th inst. The grants made at this meeting have quite exhausted the funds at the disposal of the committee, and an earnest appeal is made for liberal subscriptions and donations to enable the committee to meet more adequately the many pressing applications for aid which are being continually brought before them.

**For the Convenience** of the travelling public the Great Eastern Railway Company have made arrangements with the German railways for return tickets on and from the 25th instant, to and from German towns by the Harwich-Hook of Holland and Harwich-Antwerp routes, to be available for forty-five days instead of thirty days as heretofore, without extra charge.

**Mr. William Hardie Hay**, of the firm of Messrs. W. & J. Hay, architects, Liverpool, died on Sunday last in his eighty-seventh year. Works of the firm are to be seen in most of the towns in the North of England.

**Mr. John Lavery** has been awarded the first-class medal at the eighth International Art Exhibition at Munich.

**Dieppe Harbour** is to be considerably enlarged under the direction of the engineer, M. Herzog. It is proposed to extend early next year the west portion of the entrance to the north-west, and to the eastward a new breakwater is to be made, while the old east pier is to be demolished.

**The Bradford Historical and Antiquarian Society** on Saturday inspected Kirklees, the seat of Sir Geo. J. Armytage, Bart. A party of over sixty travelled by special train from Bradford to Cooper Bridge, where their number was increased by members and friends from Brighouse, Halifax, Dewsbury and other places. The party were conducted over the various spots of interest by Sir Geo. Armytage and Mr. J. S. Chadwick, of Dewsbury, the latter a Yorkshire antiquary who has devoted years to finding out the history of Kirklees Priory, &c.

CATHEDRAL SERIES, No. 344.—CHICHESTER: SOUTH TRANSEPT.

# THE Architect and Contract Reporter

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**CAMBERWELL.**—Oct. 29.—Plans are invited for public baths and washhouses to be erected upon a site in the Old Kent Road. Premiums of 150, 75, and 50 guineas respectively are offered. The Town Clerk, Town Hall, Camberwell, S.E.

**CHELSEA.**—Oct. 1.—Competitive designs are invited for proposed new baths in King's Road, Chelsea. Premiums, 100 guineas, 50 guineas and 30 guineas respectively. Particulars at the office of the committee, 171 King's Road, Chelsea.

**MANCHESTER.**—July 31.—Competitive drawings are invited for a fire station, a police station and other buildings, to be erected on land abutting upon London Road, Fairfield Street, Commerce Street and Whitworth Street, at a total cost not exceeding 85,000*l.* Premiums of 300*l.*, 200*l.* and 100*l.* Lithographed plan of site and copy of conditions may be obtained on application to the City Treasurer, Town Hall, Manchester.

**PENZANCE.**—Sept. 1.—Competitive plans and estimates are invited for laying-out ground situate on the Western Promenade, to include a winter garden suitable for band and other concerts, and lavatory accommodation for ladies and gentle-

men. Premiums of 21*l.* and 10*l.* 10*s.* respectively are offered for the best and second best designs. Mr. T. H. Cornish, town clerk, Public Buildings.

# WILSON'S PATENT "MULTILUX" WINDOWS

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light, and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

\* Recommended for acceptance.

THE improvement committee of Edinburgh Town Council  
has resolved to recommend the acceptance of estimates  
amounting to 5,588*l.* for the erection of houses for the working  
classes in Pipe Street, Portobello. The estimate was 7,392*l.*  
The scheme includes the reconstruction of the tenement at  
present on the site, whereby twenty-four houses will be pro-  
vided, and the construction of thirty-six new houses, making  
sixty in all, of one and two rooms.

## TRADE NOTES.

THE ventilation of St. John's school, Taunton, is being carried out by means of Mackay's patent direct-acting ventilators, supplied by the sole makers, Messrs. Cousland & Mackay, ventilating engineers, Glasgow and Manchester.

THE extensions to the Keighley and Bingley Joint Hospital, Keighley, are being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, and patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

## VARIETIES.

IT is proposed to hold an American exhibition at the Crystal Palace next year. Commerce, industry and inventions are to be extensively represented.

A REPORT which has been issued by the committee with reference to the erection of the new church at Chapel-Allerton states that the cost has been 20,926*l.* 5*s.* 10*d.*, and there is a small balance in hand to meet unascertained liabilities.

THE new parochial hall which has been built on the Lidgett Park estate at Roundhay, Leeds, was dedicated as a mission church on Saturday afternoon. As soon as the funds are available, the parish will be provided with a permanent church, but at present the building in existence is admirably adapted to the purposes for which it is required.

IT transpired at the fortnightly meeting of the Edinburgh Town Council that the contracts for the erection of the new City Hospital amounted to 271,621*l.*, and that the probable cost of remaining works required for the completion and equipment of the hospital was 62,240*l.*—together 333,861*l.*

THE memorial-stone of Trinity Church lecture-hall and classrooms, which are being erected in Woodhouse Lane, Leeds, at a cost of 13,000*l.*, exclusive of that of the site, which alone is between 8,000*l.* and 9,000*l.*, was laid on Saturday last. Mr. G. F. Danby is the architect.

COUNT KAMAROWSKY, president of the International Fire Council, which held its congress at Berlin last month, and who is now on a visit in London, was entertained by the chairman of the British Fire Prevention Committee at the Carlton Hotel

to meet the various chairmen of the sub-committees, and also the four vice-presidents of the National Fire Brigades Union.

THE new building erected by the Buckley Urban Council as a meeting-room and magistrates' court-room has now been completed at a cost of about 1,800*l.* The building has been erected by Mr. Thomas Roberts, builder, Mold, from plans prepared by Mr. R. Cecil Danes, architect, Chester.

ON Wednesday evening, when the traffic was greatest, a number of the vertical supporting cables of the suspension bridge between Manhattan Island and Brooklyn, New York, were pulled out from their sockets, and are now dangling in the air. This happened on the north side of the Manhattan end, which sagged from 4 to 6 inches, causing great excitement. All the car traffic was stopped, but after some delay pedestrians and waggons were allowed to proceed.

THE new Kursaal which has been added to the attractions of Southend was opened on Wednesday last. The estate which has been acquired for the purpose of the Kursaal and Marine Park consists of 20 acres of well-laid-out grounds, and about 6 acres of adjoining land available for open-air amusements. The main block of buildings is of an imposing elevation, having spacious internal accommodation. There is a fine dining hall, 125 feet by 60 feet, with a gallery running the whole length of the sea frontage, and numerous refreshment and recreation rooms. One of the main features of the building is the concert hall and assembly room, some 125 feet long by 89 feet wide, constructed to hold 5,000 people. This hall is fitted with a variety stage, and in the evenings will be cleared for dancing. In the Marine Park is to be found a cycle track, ground available for football and cricket, and a large open-air dancing platform. Messrs. W. James & Co., of Kentish Town, London, N.W., supplied all the leaded glazing for ceiling lights, &c., of specially strong manufacture to suit the position (lying flat), and with a special arrangement for ventilation, of which there is over 6,000 feet super.

AT a meeting of Dundee Town Council on the 4th inst. a deputation of working men was received on the subject of the housing of the working classes. Mr. William Smith, secretary of the Trades Council, who was one of the deputation, said that a crying evil in Dundee was the single-room dwellings. There were from 10,000 to 12,000 of this class of houses in Dundee, and for these an average of 5*l.* rent was paid, whilst from six to eight persons each lived in the single rooms. He asked the Town Council to adopt the Housing Act of 1890,

which would enable the Corporation to build working-men's dwellings. One of the other speakers alleged that a number of the property owners in Dundee were desirous of hiding their own shortcomings and deficiencies by blackening the characters of their tenants and seeking to obscure the real issues at stake. Lord Provost Hunter assured the deputation that the various questions raised would receive the attention of the Town Council.

THE new school which is in course of erection in Summer Street, Aberdeen, for the Roman Catholic authorities is now nearing completion, and will be ready for occupation at an early date. Already all the contractors have practically finished their work, and it only remains for the furnishings to be provided and the rooms decorated. The building faces Summer Street at an angle. On the ground floor there is a large hall which may be used as a gymnasium. Immediately above are two rooms partitioned off by a sliding glass screen, so that the rooms may be converted into one at a moment's notice. On the upper floor a similar arrangement has been provided for. The rooms are spacious, well-lighted and ventilated in the most up-to-date manner. On the ground floor and also on the upper storey, there is ample lavatory accommodation, while rooms are prepared for the headmaster and headmistress. The building is heated throughout with steam-pipes, the boiler-house being situated at the side of the school. There are two staircases to the various rooms running parallel, so that if it is thought necessary the boys may enter at one side and the girls at the other.

THE Coast Development Company, Limited, announce their Special Holiday Arrangements, and we learn that the whole of the company's fleet of seven steamers will be available for the conveyance of passengers to the seaside. The sailings from Fresh Wharf, London Bridge, will be as follows:—*Friday, August 2.*—9.15. To Southend, Walton, Clacton and back; also to Felixstowe, Harwich and Ipswich, change at Walton. 9.35. To Margate and Ramsgate and back. *Saturday, August 3.*—8.45. To Southwold, Lowestoft and Yarmouth express. 9.0. To Clacton, Walton, Felixstowe and Harwich direct. 9.15. To Southend, Walton, Clacton and back; Felixstowe, Harwich and Ipswich, change at Walton. 9.35. To Margate and Ramsgate and back. 10.0. To Walton, Southwold and Yarmouth direct. 2.0. Husband's Boat to Southend and Margate. *Sunday, 4th, Bank Holiday, and Tuesday, August 6.*—9.0. To Clacton, Walton, Felixstowe and Harwich direct. 9.15. To Southend, Walton, Clacton and

back; also to Felixstowe, Harwich, Ipswich, Southwold and Yarmouth, changing at Walton. 9.35. To Margate and Ramsgate and back. 10.0. To Walton, Southwold, Lowestoft and Yarmouth direct. 3.0. To Southend and Round the Nore, calling at Gravesend (Town Pier). The Nore steamer will not run on August 3.

THE new church of St. Chad, which has been erected in the crowded district of Cape Hill, Smethwick, has been consecrated. The style of the building, which has been erected in red brick with stone dressings at a cost of 5,000*l.*, is a plain treatment of Early English Gothic, and accommodation is provided for 600 persons. The nave is 80 feet long and 24 feet wide, and is divided from the aisles by arcades, each of five arches. The chancel is 30 feet by 24 feet. Clergy and choir vestries are provided, as well as a large organ chamber, in which a small organ formerly used in an iron structure is placed as a temporary arrangement. The main entrance of the church is from a porch on the north side, near the corner of Shireland Road. The interior of the building is faced with red brick dadoes and quoins to all windows, the remaining portion of the walls being plastered. The roof is open timbered, of pitch pine and red deal; the windows have been glazed with leaded lights, and the heating of the building will be by the low-pressure system. The edifice is lighted from ornamental wrought-iron coronas, suspended from the nave arcading. Messrs. J. Harley & Son have carried out the work from designs by Mr. F. G. Gill.

A NEW Wesleyan church erected in Norman Road, Hastings, on the site of one which was destroyed by fire last year, has recently been opened. It is in the Gothic style of architecture, with a tower and spire. The grouping of the various parts and the pleasing detail form a picturesque building that will be an ornament to the town. The church is upwards of 78 feet in length and 47 feet in width with a transept and organ chamber in addition, and is suitable in all its detailed arrangements for the accommodation of about 650 worshippers. The edifice is erected in native blue stone with Bath stone facings. Nave and arches are in Bath stone and polished granite columns with clerestory above, finished with traceried windows. The roof is open chambered to the height of the collar, and the joinery is in pitch pine. The windows are filled in with tinted cathedral glass. The rostrum is of pitch pine, embellished with roses of sycamore, and approached by four steps. The height of the spire is about 90 feet. Illumination is given both by electric light and gas. There are ten electroliers, some with

five burners each. Vestries and schoolroom are at the rear of the building. The architect was Mr. James Weir, of 17 Victoria Street. The total cost was about 5,500/.

ON Saturday afternoon a small party of the Birmingham Archæological Society visited Long Itchington and Stockton. The former is one of the pretty villages of Warwickshire, with a large village green, fringed by cottages with luxuriant gardens. The church was first visited—a large church of Early English and Decorated features. It is probable that there was a small church of simple Early English design, having a south door of transitional Norman date. To this was added, perhaps two generations later, a nave and chancel alongside, making the old nave into a south aisle to the new nave. Some interesting windows with straight mullions suggest a rebuilding of the windows about the seventeenth century. There is a curious screen here of probably the time of Charles II., while a well-marked squint is to be found looking from the south aisle to the high altar. On leaving the village a handsome house with five gables, dated 1511, attracted attention. A pleasant walk of about two miles brought the party past the cement works to Stockton, whose prosperity now rests, like the village itself, on blue lias. Hereabouts are several quarries in the blue lias for supplying the cement works. In one of these was lately found a very large fossilised dinosaurus, now in the museum in London. The church has been largely rebuilt, but Archdeacon Colley kindly showed the very interesting old registers dating back to Queen Elizabeth's reign, of much interest, and other old documents, together with a black-letter Prayer Book, issued in the reign of Charles II., in which the prayer for the king had been altered in ink to James, and again to William and Mary.

### ELECTRIC NOTES.

THE Stepney Borough Council at their last meeting accepted tenders for laying electric-light cables along the Mile End Road. The work is to be commenced almost immediately, and every effort is to be made to complete it by the early autumn. When this is done the whole of the route from the West End of London to Epping Forest will be illuminated by the electric light. At the present time the Stepney installation is the cheapest in London, the average cost to consumers only being 3d. per unit, bringing the cost of electricity down to that of gas.

THE Lord Mayor has promised to publicly inaugurate to-morrow the municipal telephone system at Tunbridge Wells, the first of its kind established in England, and for which a license has been obtained from the Postmaster-General. The ceremony will take place in the Great Hall, and afterwards the Lord Mayor and other guests will be entertained at luncheon in the Pump Room. One result of the competition of the Corporation of Tunbridge Wells with the National Telephone Company is that the latter have reduced their rates in Tunbridge Wells about 50 per cent.

### BUILDING AND BUILDERS.

THE corner-stone of a new Sunday school in connection with St. Mark's Church, Leeds Road, Huddersfield, was laid on Saturday afternoon. The cost of the new school is estimated at 1,950/.

As a memorial of the late Queen Victoria, it has been decided to erect a new wing of Leicester Infirmary and establish a convalescent home. At a meeting of representative citizens it was announced by the Mayor that the scheme would involve an expenditure of 30,000/., towards which he had received over 24,000/.

A REPORT has been presented to the Paddington Borough Council by a special committee recommending the erection of a new town hall on the site of the present building and adjacent ground, at an estimated cost of 60,000/.. The land is already the property of the borough. The Council will consider the report at a special meeting.

AN inquiry was held at Sleaford Sessions House on the 16th inst. by Mr. A. W. C. Malet, a Local Government Board inspector, to consider the application by the Kesteven County Council for a further loan of 42,000/., to complete the new county asylum at Rauceby. No opposition was offered. It was explained that the total estimate was 166,037/.. The additional loan was required to meet the cost of furnishing and equipment, heating and ventilating and other works.

THE foundation-stone of a new Grammar school at Lichfield was laid on Saturday in the presence of the Corporation, the undertaking owing its initiative to the Dean of Lichfield. The Joint Lands Trust has given a site of 8 acres and made a contribution of 4,500/.. Special attention has been devoted to perfecting the scientific and technical departments, and the Staffordshire County Council has promised a substantial grant for this purpose. The whole expenditure is estimated at

upwards of 9,000*l*. The new premises are only part of a larger scheme which will be carried out later should the school succeed. The projected buildings will afford accommodation for 125 boys, with 22 resident scholars, and comprise residences for the head master and assistant masters.

MR. NORTH, Local Government Board inspector, held an inquiry at the Town Hall, Carlisle, on the 19th inst., relative to the application by the Town Council for leave to borrow 17,000*l*. in respect of the Bridge Street improvement, 6,000*l*. for the proposed dépôt, and 1,985*l*. in regard to the proposed Turkish baths. Among those present were Mr. Wheatley and Mr. F. P. Dixon, with the town clerk, the city surveyor, the gas and waterworks engineer, the city treasurer, the clerk of the County Council and other officials. There was no one present to oppose any of the applications. In reference to Bridge Street, the town clerk explained the scheme and a plan, which was shown, and the city surveyor gave the 1901 population of the city as 45,478. The inspector asked when the houses were built. The surveyor replied that they were so old that the plaster was put on rushes, and some of the slates were fastened with fishbones.

MR. W. A. DUCAT, of the Local Government Board, visited Bradford to hold an inquiry into the application of the Corporation for power to borrow 53,000*l*. for the provision of baths for the city. Mr. W. Beverley appeared for the Corporation and Mr. H. Newall (instructed by Messrs. Rawnsley & Peacock, solicitors, of Bradford) appeared on behalf of Mr. Eli Watson, brushmaker. The scheme as laid before the inspector included the erection of central baths in Morley Road and district baths in Drummond Road. There are at the present time only two baths in the city. The estimated cost of the proposed central baths in Morley Road is 41,085*l*., including the site, and for the Drummond Road baths 9,671*l*. 6*s*. 10*d*., also including the site. The opposition from Mr. Wilson was on the ground that the plans as submitted would do away with an alleged right to a back road which was one of the conditions of sale when he bought an adjoining plot of land in Morley Road from the Corporation. This, however, was denied by Mr. Beverley. The Inspector heard both sides and will make his report later.

At a meeting of the governors of the Dundee University College the question of erecting new buildings for the completion of the medical school was considered. It was proposed that accommodation should be provided in the new buildings

for the new chairs—medicine, surgery, pathology, materia medica, midwifery, and medical jurisprudence and public health—and that the old Dundee chairs of anatomy and physiology should also be housed in the new buildings, the trustees, on their part, granting a site on the college grounds for a nominal feu duty. The new buildings were estimated to cost 20,000*l*., and of this sum they hoped to receive from St. Andrews about 15,000*l*. on account of the proportion of arrears and accumulations of the Parliamentary grants dedicated to Dundee. Mr. J. J. Weinberg, jute merchant, moved that the proposed arrangement between the Council of the College and the University Court of St. Andrews for the erection on one site of the college property of buildings to be used as a school of medicine, be approved, and that the trustees of the college be authorised to enter into the necessary feu contract. He remarked that the necessity for the better accommodation of the Dundee medical chairs had for years been a growing one. Mr. John Robertson seconded. Sir John Leng, M.P., said he was sure that not only the medical profession, but the inhabitants of Dundee generally, and of the district, must rejoice that they were the foundation-stone of a properly equipped medical school for Dundee. The motion was unanimously adopted.

A PUBLIC inquiry was held at Sleaford on the 16th inst. by Mr. A. W. C. Malet, an inspector of the Local Government Board, with respect to an application by the Kesteven County Council for leave to borrow a further sum of 42,000*l*. for the completion of the new county asylum at Rauceby, near Sleaford. The officials present included Mr. J. Phillips (clerk to the County Council), Dr. Ewan (medical superintendent), Captain Peacock (county treasurer), Mr. Holdich (clerk to the visiting committee), Mr. Carter Pegg (architect) and Mr. W. Wright (county surveyor). No opposition was offered to the application. It was stated that the outstanding loans amounted to 104,000*l*. The original estimate in 1898 was 125,000*l*., but was increased in 1899 to 144,693*l*., and in March 1901 to 164,557*l*. The increase was accounted for by the purchase of the site, the cost of laying in foundations, the extension of farm buildings, water-supply, laying-out the grounds, &c. The total estimate up to date was 166,037*l*., which would include everything. The contractors, Messrs. Kirk, Knight & Co., had received 73,500*l*., and there was still due to them 32,853*l*. The extra loan was required for furnishing and equipment, 10,000*l*.; electric-lighting balance, 4,617*l*.; water-softening tanks, heating and ventilating, 3,800*l*;

roads, fencing and several smaller items. After evidence had been taken, the inspector and officials viewed the buildings, which are now nearing completion.

### VICTORIA STONE.

It is not alone as a material adapted as a substitute for several varieties of stone in buildings, and for the execution of the most elaborate architectural ornament, that Victoria stone has become renowned. Its toughness to withstand traffic, and other qualities, have obtained preference for it when footways are to be formed in many provincial towns. At the present time a large quantity of the flags are being laid down in Littlehampton. As a watering-place with many older rivals, there is a necessity to bring the town up to the most advanced standard, and from the success of its drainage and paving Littlehampton can be considered a model town. The Duke of Norfolk's desire is to insure the fitness of his "Port of Arundel" for permanent residence, and the authorities endeavour, with the aid of his Grace's liberality, to attain the ducal standard. As one means towards that end Victoria stone has been in use for the footways. The traffic is exacting, for there are heavy bath-chairs constantly passing, and troops of children perform exercises which would quickly put an end to anything with a slight element of fragility in its composition. For years, however, the slabs of Victoria stone have withstood all varieties of passing loads as if they were invulnerable against attrition, and those which were earliest laid show no outward signs of wear. After so onerous a test coupled with resistance to climatic variations, it is not surprising the stone was selected for the new streets forming the extension of the town, and that it has been substituted for various descriptions of pavement in other streets. One remarkable characteristic of the operations of the paving is the expedition with which the flags can be set in their places. The mathematical accuracy of lines and angles and the absence of any winding, enable each to be laid in its place without a moment's delay for consideration. There is no time lost in squaring or fitting, and from their toughness the flags can be handled and carried without any loss from breakage. A visit to any street in which Victoria stone is being laid is enough to demonstrate the economy attained by using the material, while it is only necessary to examine a flag after several years' use to be assured of its extraordinary durability.

### TYNEMOUTH PIER.

A NUMBER of members of the Newcastle-upon-Tyne Association of Students of the Institution of Civil Engineers have visited the works in connection with Tynemouth Pier. They were met by Mr. I. C. Barling, the resident engineer, who explained the new work rendered necessary by the destructive storms of the winter of 1896-97. A new pier 1,500 feet in length is being constructed to the southward of the existing pier, being made lineable with the straight portion forming the shore end of that structure, and with it making a pier straight from end to end of a length of 2,900 feet. The foundations of the new work are on hard shale, and their depth averages about 20 feet below those of the old work. The new pier is being built of concrete blocks, bonded from side to side, and it is being faced with granite. At the point where the foundations dip from the old to the new level, cylinders 13 feet in diameter are being sunk so as to form a bulkhead to prevent the rubble foundation from getting away from under the old work. The work of block-setting was explained by Mr. Barling, and a number of the more venturesome visitors descended in the diving bell. This portion of the undertaking having been thoroughly inspected, a visit was made to the yard, where the process of block-making, from the raw material to the finished concrete block, was witnessed. Attention was specially drawn to the very heavy plant used for handling the blocks.

### SOLIGNUM.

SOLIGNUM (*anglice* wood saver), is the name which Messrs. Major & Co., Ltd., of Hull, have given to a wood stain and preservative which they are placing on the market, and for which they claim consideration on the following grounds:—That it adds years to the life of wood if applied carefully according to instructions, rendering it impervious to decay. That it is a better preservative than paint, as, while paint only preserves wood from outside attack, Solignum also destroys the causes of decay in the inside. That it is not only a preservative, but a stain, and in many situations its appearance presents great advantages over paint or tar. That Solignum may be painted over with any shade of paint. That it is easily applied, has exceptional covering qualities, and is a protection against vermin and insects, &c.

## THE "NEW MAUGHAN" GEYSER.

THE "New Maughan" geyser, of which we give an illustration, while retaining all the distinctive features to which the older pattern owes its high reputation, has been improved in details so as to adapt it in every way to modern requirements. Among the many excellent qualities claimed for the new form of geyser may be mentioned the following:—

There are no tubes, chambers or other confined spaces in the interior. It is, therefore, not affected by the "fur" in hard water, or by frost, and cannot burst. The "New Maughan" geyser is fitted with a vent socket for connection to flue pipe when used in rooms of less than 1,000 cubic feet capacity. The durability of the old pattern is fully maintained in the "New Maughan" geyser. The thorough protection of the metal by the water renders those made in galvanised iron as lasting as most other geysers of copper, while the copper quality is still more durable. The cost of the "New Maughan" geyser is less than half that of the "circulation" system, and considerably less than any other "high-class" geyser. The consumption of gas in heating a 30-gallon bath is 20 cubic feet (costing about 3d.), as against 30 to 40 cubic feet in other patterns. The "New Maughan" geyser is the easiest to fix and use. The water is supplied into the open spout from cistern or main through any pattern tap, thus avoiding any objections from water companies, while the supply being visible is easily adjusted. The gas cock is provided with a small pilot jet, which is lit first and passes into the burner by the act of turning the main cock, thus avoiding any risk of gas escape or explosion. No pressure of water is necessary, as the water supply is not connected to the geyser or valve, but enters the open spout from an ordinary tap. This valve will operate equally well whether supply is direct from main or from tank, and can be used when the water authorities prohibit the interlocking taps or other direct connection between main and geyser. All working parts are of metal, and all other similar valves depend upon diaphragms or tubes of leather, rubber or other perishable material, the deterioration of which causes leakage or failure. The new automatic valve has no such parts, is frictionless, and not likely to get out of order, whatever the quality of water.

An important feature of the "New Maughan" geyser is the new automatic gas and water valve. The working of this is as follows. In the upper reservoir of the geyser is a float, which is lifted by the cold water entering. A rod or lever is fixed to the float, and communicates with a valve opening the gas supply through the tube shown at the side of the geyser. The gas therefore can only pass to the burner when a sufficient quantity of water is entering the geyser, being shut off by the gas valve when the float is down. For preventing gas escape a telescopic water seal (as used in sliding chandeliers) is employed, this being self-filling.

## NEW BOARD SCHOOL, SHIRLEY.

THE foundation-stone has been laid of the new Board school which is being erected at Shirley, Hants. It is situated on a site at the northern end of Foundry Lane, nearly adjacent to the main road through Shirley, being part of Shirley Free-

hold Building Estate; will have three frontages—to Foundry Lane, on the east, English Road on the south and Imperial Road on the west—and will cover an area of 1a. 3r. 23p., the ground being purchased by the School Board for the sum of 1,583 $\frac{1}{2}$ l. In addition to this there was also purchased a small piece of land with two semi-detached cottages thereon for 586 $\frac{1}{2}$ l., this forming the south-west corner of the school site. It is intended to utilise these cottages as residences for teachers and caretaker.

The main school buildings are divided into two separate oblong blocks, that facing English Road being a two-storey building, for girls on the ground floor and for boys on the first floor. The girls' department contains two schoolrooms, each 60 feet long by 23 feet wide, and four classrooms, each 25 feet by 25 feet, connected by a corridor having two separate ranges of lavatories and two hat and cloak-rooms. The rooms for head teachers' use are placed between the two floors, with staircases leading thereto. To meet the wishes of the Board of Education the arrangement of the four classrooms can be converted into a central hall, by having sliding partitions and revolving-shutter partitions in the place of brick division walls, so when it may be required, by moving the partitions, these four rooms can be adapted as one room, capable of accommodating a large assemblage of children. The boys' department on the upper floor will be approached by two stone staircases, and the general arrangement and planning of the rooms, &c., is similar to that for girls on the ground floor, including the providing of movable partitions to classrooms. The two departments in this building will provide accommodation as settled by the Board of Education for 480 boys and 480 girls. The infants' school, which is a separate block of buildings, is placed at the north end of site, and the arrangement is one large schoolroom (70 feet by 24 feet), and fitted with sliding partitions, also six classrooms (23 feet 6 inches by 23 feet), a wide corridor that can be used as a marching hall, with narrow corridors as passages to the hat and cloak-rooms, lavatories and rooms for head teachers, &c. This building will give accommodation for 530 infants.

The several rooms will be heated by approved warming grates in open fireplaces and lighted by gas. There are two capacious playgrounds, one for the boys and the other for the joint use of girls and infants. There are also provided covered play-sheds. The property will be enclosed by a brick wall on the north and west sides, and the frontages to Foundry Lane and English Road will have an iron fence, with gate entrances therein to the playgrounds.

The exterior elevations of school buildings are of a very plain character. They will be of red brick, relieved by a little stonework, some coloured brick bands, moulded brick strings, projecting courses to eaves and gables, slated roofs, with red ridge tiles, &c.

The contractors for carrying out the works, at a cost of 17,607 $\frac{1}{2}$ l., are Messrs. Jenkins & Son, of Southampton. The plans were prepared by Mr. John H. Blizard, architect to the School Board, and the whole work is being carried out under his direction, assisted by Mr. S. Jurd, the School Board clerk of works.

## ST. SAVIOUR'S, LIVERPOOL.

ST. SAVIOUR'S CHURCH, Huskisson Street, Liverpool, which was partially destroyed by fire in February of last year, has been reopened after restoration. Internally the new church is entirely different from the old one. The walls of the former building have been left practically as they were before the fire took place. Numerous changes, though, have been made in the details of the edifice. The chancel is now placed at the west end of the church, and the porches and staircases at the east end. One side of the tower has been removed so as to place the necessary weight on powerful steel stanchions and girders; the remainder of the old circular Bible porch now forms an apsidal termination to the chancel. The side porches have been converted into a commodious organ chamber and vestries for the choir and the clergy, the latter being upstairs. The space which formerly existed behind the chancel has been transformed into a baptistery, and the old vestries have been made into porches. By these alterations many advantages are obtained, and as much as 35 feet has been added to the length of the building. During the restoration a capital suggestion was made by some one, with the result that a space beneath the old church, about 10 feet high, can now be utilised as a mission hall. A portion of the earth was removed from inside this subterranean cell, and the floor of the church has been raised about 3 feet and windows have been placed in the walls. This place has been made bright, light and sanitary, and will be serviceable for missionary and other purposes. The raising of the floor has not been done at the expense of the space in the church, for by the use of light steel trusses added to the heavy principals of the old building, the ceiling has been made higher by several feet, and has been curved and beautified with skilfully-moulded beams.

A change at once noticeable is the fact that the church has now no galleries, and instead of having two rows of windows as formerly there is only one row, the old top windows having been lengthened. The church thus seems considerably more spacious than of old, and is lighter and much more cheerful looking. The inside is fitted with electric-lighting apparatus, the suspended lamps from the ceiling—about 100 in number—being of a chaste description. The high walls have been decorated in conformity with the other portions of the interior, and the windows will be suitably ornamented in course of time. The chancel is enclosed by a richly panelled walnut screen, and the whole of the seating and fittings are made of the same wood of a rich Renaissance design. The floor increases in quality as it approaches the east, the materials being white stone, rock asphalt and Sicilian marble. The east window is to be filled at once with stained glass. The pulpit is only a temporary one and the organ is not yet finished. The whole building is warmed and ventilated on Mr. Key's Plenum system, fresh air, cold in summer and warmed in winter, being forced in by electric fans capable of changing the whole of the air, if desired, as often as six times an hour. The architects are Messrs. Willink & Thicknesse.

### LONDON BOARD SCHOOL BUILDINGS.

THE works committee of the London School Board, in their annual report just issued, give an abstract of the work done during the year ended March 25, 1901, and show the progress made in the provision of school accommodation which has been sanctioned by the Board of Education. The details indicate that the School Board are still engaged in extensive and costly building operations. It appears that in the session of 1899-1900 compulsory powers were obtained over sixteen sites for schools in various divisions of London, and additional land for thirteen existing schools, with a view to the enlargement and improvement of the school buildings or playgrounds, and the Board during the past year agreed to purchase various interests in twenty-nine sites at a cost of 79,168*l*. The value of these sites and of all the sites previously purchased or agreed to be purchased up to the end of the year under review is set down at 3,645,601*l*, and the costs in connection with the purchases amount to 492,343*l*. The average cost of the sites for 440 schools, the accounts of which had

been completed at September 29 last, was 7*l*. 2*s*. 6*d*. per child. The total number of permanent schools which had been erected and opened up to Lady Day of last year (exclusive of transferred schools which have been improved but not enlarged) was 444; and during the past year six additional schools and nine enlargements were opened, providing a total accommodation for 7,488 children. The average cost per head of the buildings and furniture of 440 schools has been—school buildings (exclusive of sites), 14*l*. 9*s*. 2*d*, and furniture and fittings (such portion as is chargeable to capital account), 10*s*. 11*d*. Tenders have been accepted during the year for eight new schools, providing accommodation for 7,430 children, and ten enlargements of schools, providing additional accommodation for 2,577 children. In the case of one school, to be erected in the Hackney division, the tender includes the provision of two halls, a gymnasium with dressing-rooms, a chemical laboratory, a physical laboratory, lecture-room, drawing classroom, clay-modelling room, needlework-room, storerooms for chemicals, two teachers' rooms and a manual training centre for forty boys. The Board intend to make application to the Board of Education for the recognition of this school when completed as a higher elementary school. Tenders have also been accepted for the following work:—Two cookery centres, three laundry centres, a housewifery centre, six manual-training centres, seven schools for special instruction, six for sixty children and one for forty; two blocks of semi-detached cottages on the "Anerley" site for the accommodation of thirty deaf boys and thirty deaf girls, also a centre block consisting of school building and a manual training centre, the tender for the whole amounting to 19,000*l*; a blind centre in connection with an existing school and enlarging the blind centre on another site; various alterations and additions to Upton House Industrial school to cost 6,299*l*; adapting a disused school at Poplar for the purposes of a day industrial school at a cost of 4,489*l*; erecting a small infirmary for the residential deaf on the Homerton College site at a cost of 1,000*l*; providing a swimming bath at Lyham Road school, Brixton Hill, for the use of scholars attending this and the surrounding schools, at a cost of 6,496*l*; providing necessary fittings for lighting six schools by electricity; carrying out drainage and sanitary works at eighteen schools, the tenders for the work at fifteen of the schools being 30,749*l*; and other works. At Lady Day last the work in hand included the erection of eighteen schools providing accommodation for 16,966 children; eleven enlargements providing accommoda-

tion for 3,629 children; thirty-one additional sites had been or were being purchased, the schools to be erected on twenty-two of them to provide accommodation for 17,758 children; fourteen sites for new schools had been scheduled in the session 1900-01, the schools in six of which would give accommodation for 4,150 children; and twenty-two enlargements of schools had been sanctioned by the Board of Education, for which tenders had not been accepted, providing accommodation for 6,555 children. The committee had opened, up to the date of the report, the playgrounds of 252 schools on Saturdays for the use of the children.

#### BUILDERS' BENEVOLENT INSTITUTION.

THE fifty-fourth annual meeting of the Builders' Benevolent Institution was held on Thursday, July 18, at the offices, 35 Southampton Row, Bloomsbury, W.C. Mr. J. T. Bolding presided, supported by Messrs. C. Bussell, E. V. New, Thos. Stirling, T. Stirling, jun., J. Carmichael and other friends of the charity.

The secretary (Major R. A. Brutton) read the annual report, which stated that when the unprecedented pressure of the times upon all classes of society was remembered, and how the great charities of the Metropolis had suffered, it was a subject of congratulation that this Institution had not been more seriously affected. At the same time, the falling-off had been chiefly in the annual subscriptions, which must always be the mainstay of the charity. It was, therefore, hoped that those gentlemen who already subscribed would use their influence with any friends who had not done so. The Institution owed a debt of gratitude to the president, Mr. John Greenwood, C.C., for his efforts in making the annual dinner such a financial success. The committee had again been able to elect all the eligible candidates this year, and it was a source of thankfulness that the members seeking election had not been sufficiently numerous to entail the necessity of a contested election. It was, however, expected that the number of applicants would be greater in the future, in consequence of Rule III., Section 1, altering the age of candidates from sixty to fifty-five, having been sanctioned at the last general meeting. Only three deaths amongst the pensioners had occurred during the year, all of whom were men, while five pensioners had been elected. The annual dinner would be held at the Carpenters' Hall on Thursday, November 14 next, when Mr.

James Carmichael, of Wandsworth, who had consented to be president, would be in the chair.

Mr. Thomas Stirling moved the adoption of the report and accounts, adding that so long as they were on the right side, and elected all the applicants, he believed the subscribers would be well satisfied.

Mr. New seconded the motion, which was unanimously agreed to.

Mr. C. Bussell proposed a cordial vote of thanks to the retiring president, Mr. John Greenwood, for the valuable services rendered to the Charity during his year of office. It must be a satisfaction to Mr. Greenwood to leave the Institution in a somewhat better position than when he took office, and he would move that he be requested to become a member of the committee.

Mr. T. Stirling seconded the motion, which was carried by acclamation.

Votes of thanks were also passed to the vice-presidents, the trustees, the treasurer (Mr. J. Howard Colls), the committee (the retiring members being re-elected), and to the hon. auditors (Messrs. J. T. Bolding and R. J. Ward).

The Chairman next proposed the election of Mr. James Carmichael as president, and congratulated the meeting on being able to get so well known a man connected with the building trade to take the post.

Mr. Stirling seconded the resolution, which was agreed to *nem. con.*

Mr. Carmichael replied, and announced his determination to do his utmost for the Institution.

A vote of thanks to the chairman closed the proceedings.

#### NEW NELSON HALL AND BRANCH PUBLIC LIBRARY.

THE plans of the new Nelson Hall and Branch Library in Leith Walk are now before the Edinburgh Dean of Guild Court. This will be the third building erected by the Nelson Trustees in accordance with their arrangement with the library committee, and when completed it will be the largest and most conspicuous of the branch libraries. Through the kindness of the Hope Trust a fine site has been feued at the corner of Leith Walk and M'Donald Road. To meet the requirements of the feuing elevation the front buildings towards Leith Walk have been made three storeys high, and those towards

BLACKFRIARS WORKS, MANCHESTER.

M'Donald Road two storeys. The Nelson Hall and the library, which are behind, are kept one storey. The two upper flats towards Leith Walk contain a house for the librarian and for a caretaker, entered by a separate stair from Leith Walk. The upper floor, towards M'Donald Road, contains a large hall, which it is proposed to fit up as a gymnasium, and will be specially constructed so as to make it one of the finest gymnasiums in Edinburgh. It measures 55 feet by 30 feet wide, and suitable retiring-rooms and lavatories have been provided. Advantage has been taken of the angle of the street to bring out the frontage in a series of projections which break up the building and add greatly to the appearance of the whole. The corner has been emphasised with an octagonal and round tower, which will be a prominent feature in Leith Walk. The handsome doorway, entrance hall, staircase and the large mullioned windows of the various halls have been artistically worked out. The main entrance is placed near the corner in M'Donald Road, and leads into a large entrance hall, from which ready access is obtained to the library and halls. On the plan, right in front of the entrance, is the lending library—46 feet by 30 feet—where accommodation is provided for 20,000 volumes, all within reach of the hand, with ample space for borrowers and indicators. The library will have an open-timbered roof, and will be lighted entirely from above. The librarian is so placed that from his position in the centre of the building he can attend to the public counter and at the same time see into both the reading-room and the Nelson Hall, thus enabling him to superintend the whole building. To the left of the library, occupying the frontage to Leith Walk, is the reading-room, measuring 55 feet by 21 feet. It is separated from the library by a row of columns and arches. The lower part of the tower is formed into a large corner oriel window. This room will be supplied with newspapers, weeklies, magazines, &c. The Nelson Hall measures 78 feet long by 50 feet wide, and is divided by two rows of columns and arches, which in turn carry the open roofs. The main part of this hall will be lighted from the roof, but the front portion will have large mullioned windows to the front. The Nelson Hall will be supplied with a large number of daily newspapers, magazines, and chess, draughts, dominoes, &c. The whole of the building will be heated with hot water and lighted with electric light, and made as attractive as possible. The architect is Mr. H. Ramsay Taylor (of Lessels & Taylor, 7A Young Street), who was also the architect for the branch libraries already built, which have been so successful.

## INTERNATIONAL EXHIBITION AT WOLVERHAMPTON.

A SCHEME has been under consideration for holding an art and industrial exhibition at Wolverhampton next year, on similar lines to that at Glasgow. The matter has now taken a definite shape, as the proposal has met with more enthusiastic support than was at first anticipated. An executive committee was appointed, and they have secured the services of Mr. H. A. Hedley, the manager of the Glasgow Exhibition, to act in a like capacity. When the scheme was first put forward 25,000*l.* was fixed as a guarantee fund, but this has been exceeded, and it now amounts to about 30,000*l.*, derived from promises ranging between 500*l.* and 10*l.*, the lowest limit, while the committee have decided to further raise the aggregate fund, as promises are being received rather freely. These have come in continuously since the general public found that the success of the undertaking was assured. Lord Barnard has granted the free use of a large area of ground as a site, and the town council has also set aside a portion of the West Park containing a large lake and several roads to be utilised as exhibition space. The whole will cover between 30 and 40 acres. Plans for the laying out of the site and the erection of a number of buildings have been prepared by Messrs. Walker & Ramsey, of Glasgow, and are approved. These provide for the erection of an industrial hall, 378 feet by 170 feet, a large machinery hall, concert-halls, restaurants, &c. The list of guarantors and vice-presidents includes a large number of noblemen, members of Parliament, manufacturers and others connected with the Midlands. Sir George Hayter Chubb and others who have been associated with exhibitions are taking an active interest in the movement. It has been determined to make it of an international character, and promises of support and to contribute exhibits have already been received from Canada, Russia and other foreign countries, while there is an overwhelming effort among English manufacturers in numerous trades to contribute towards making the project very successful. Contracts for the work in connection with the buildings will be given out in a short time, while the Corporation electric tramways which are in course of construction to pass the exhibition ground and through a large portion of the town connecting outside places will be completed before next May, ready for the opening ceremony of the Exhibition. A feature which now marks the movement is that manufacturers, merchants and others who held aloof are sending in their names to the guarantee fund in sums of 100*l.* to 250*l.*

## TANGYES OIL ENGINES

Sizes 1 up to 16 brake h.p. in Single Cylinder.

QUOTATIONS ON APPLICATION.

CORNWALL WORKS,  
BIRMINGHAM.

## Ventilators.

NEW PATENT. Automatic Mica Valve Exit Ventilators.  
SILENT AND SMOKE-PROOF.

Back View showing Improved Shield Back Plate.

ALUMINIUM VALVE EXIT VENTILATOR  
(Chapman's Patent),  
FOR AIR-SHAFTS AND OUTER WALLS.  
SHERINGHAM'S, SILK FLAP, ARNOTT'S & ADJUSTABLE  
LOUVRE VENTILATORS, INLET TUBES & BRACKETS.  
HEATING & LIGHTING ENGINEERS  
Workers in Iron, Brass, Bronze and Copper.

## THE WEEK.

THE executive committee of the National Memorial to Queen VICTORIA, consisting of Sir E. J. POYNTER, P.R.A., Sir L. ALMA-TADEMA, R.A., Lord WINDSOR, Viscount ESHER, Sir ARTHUR ELLIS, Mr. A. B. MITFORD, Mr. SIDNEY COLVIN and Mr. WILLIAM EMERSON offered the following suggestions at their meeting on Thursday in last week:—1. The committee recommend that Mr. BROCK'S design for the memorial be accepted, subject to such modifications as may be necessitated by the scheme of the Memorial as a whole. 2. That Mr. ASTON WEBB'S plan for the general treatment of the space in front of Buckingham Palace be accepted subject to certain necessary changes. 3. The committee further recommend that the consideration of the remainder of the Mall scheme be postponed until the amount of the subscription to the National Memorial has been completed. There will, of course, be much disappointment at the phase which the architectural competition has assumed in the recommendations. As the affair now stands, there was no necessity for a competition between architects. All that is proposed at present is to increase the space outside Buckingham Palace by bringing forward the railings, but whether railings will again be used, or a colonnade, is at present undecided. From the first it was realised that the Mall was to be extended to Charing Cross, which has long been a desirable consummation of any improvement in the Park, but at present so important an enterprise is to be set aside. All that can be thought desirable at the present time is the erection of a sculptured group dedicated to HER MAJESTY. On a platform about 8 feet high and 100 feet in diameter, with a fountain on either side, a high pedestal will arise on which a seated statue of the QUEEN will be placed. Below it will be groups symbolising Justice, Truth and Charity, or Maternity. A square column will also arise carrying figures of Victory, Constancy and Courage. The height of the memorial will be 60 feet, but it cannot have the grandiose effect of the Albert Memorial. In one case, however, there is an unarchitectural building as a background, while in the other there is a landscape. No doubt Buckingham Palace is interesting from its associations, but its presence will not enhance the effect of the new arrangements. If the sculptured memorial is successful, as is likely, it will probably aid in increasing the subscriptions, and then we may have architectural surroundings worthy of the subject, but at present architecture has to give way, and might be said to have no independent existence.

THE new Ulster Society of Architects has been of service already in several cases relating to works in Belfast and elsewhere in the North of Ireland. One of them was the asylum buildings at Purdysburn for the Belfast Corporation. The details of the terms with Messrs. GRÆME-WATT & TULLOCH, the architects, were considered, and were reported as unsatisfactory. A resolution had been forwarded to the town clerk on June 12 complaining of this unsatisfactoriness. The points objected to were that no travelling expenses were intended to be paid, that the remuneration was under what is recognised, and that there were various other conditions as regards approval of plans and arbitrary rejection of same on account of their disapproval by the asylum committee, or in case they exceed the architect's approximate estimate by more than 10 per cent., without his having the opportunity to recast them to bring the proposed buildings within the permitted cost limit. The opinion was expressed that when the asylum committee understood that the proposed conditions are unfair and unreasonable, that the majority at least, who only wish to be equally fair to the ratepayers and to those whom they employ, will at once make the modifications which were suggested, as of course it is entirely against the interests of the ratepaying community that any services, especially those requiring great care and skill, the absence of which in architectural work is so disastrous in result, should be inadequately remunerated. The Belfast Corporation are not remarkable for liberality in their dealings with architects, and it does not appear any alteration has

taken place in the conditions of the arrangements for the new asylum buildings.

THE temple on the little island of Ægina must always have interest for English artists. COCKERELL was a member of the party who discovered the ruins in 1811. He pointed out the peculiarity of the sculpture, and urged its purchase. He did not, however, make sufficient allowance for the supineness of the officials in English Government offices. Although the money was voted, and the arrangements were supposed to be complete, the remarkable sculpture found its way to Munich instead of to London, and English students of sculpture have to be contented with casts. The affair is to the official mind a triumph of circumlocutionism, but it has been since outdone by others of a more momentous character. It was concluded that the sculpture of one of the pediments represented the contest over the body of PATROCLUS, while the other showed another expedition against Troy. But there have been various other interpretations of the sculpture. As it was supposed the sculpture was of national importance to the Greeks, it was inferred that the temple was dedicated to ZEUS PANHELLENIUS, and the building became known in modern times as the Panhellenium. It is now doubtful whether another title will not have to be employed. The Bavarians cannot forget a building which will be a memorial of their victory over the English Governmental system, and they have selected the ruins as a site for exploration. An inscription has been recently found which would indicate that the great temple was dedicated to a local goddess named APHAIÀ. This is a declension, but it may have been firmly believed that the vessels which brought slaves and other commerce to and from Ægina would be in danger if they offended the goddess, and accordingly they raised to her a temple overlooking the sea.

VISITORS to Bologna are generally puzzled by the two towers, the Asinelli and the Garisenda. If judged impartially they are not better examples of brickwork than can be seen by the thousand in the factories of Lancashire. They have suffered from settlements, and have long ceased to possess verticality. The Garisenda especially is so much out of plumb one wonders why it has not collapsed. But Italy exercises so much glamour over the judgment, we may occasionally hear travellers speak of the towers as if they were most picturesque constructions which have an important function in general views of the city. The Garisenda has, however, literary interest, for DANTE refers to it in his "Inferno," comparing the giant who stoops to seize him and VIRGIL to the tower at a time when it was cloud-capped. The inclination of the Garisenda is due to a sudden sinking of the soil, but it has stood so well there must be some pity for it, for as far as can be judged it can hardly escape from a collapse. The soil which so long was unaffected by earth movements is now sinking, and produces cracks in the walls of the structure, which is square on plan and about 180 feet in height. The mortar is falling out of the joints. It is perhaps excusable for the authorities of the old scholarly city, which was known as the Alma Mater Studiorum, to imagine that the tower cannot be overthrown, and to assume that its security can be insured by the application of a little rough-cast, but a structure that is 10 feet out of the perpendicular, and is nearly a thousand years old demands a more efficacious remedy.

THE law officers have come to the conclusion that the gold ornaments found in Ireland, and which were purchased by the Trustees of the British Museum, must be treated as treasure trove and belong to the Crown. The Treasury therefore proposes to send a request to the Trustees for the surrender of the ornaments. It does not follow that the law officers are infallible, and the Trustees must already have obtained legal opinions leading to an opposite conclusion in order to justify their purchase and retention of the ornaments. As we have already said, the place for such a collection should be in the great museum of the empire, which is visited by people from all parts of the world. Respect for the law, however, prevails among most Englishmen, and if it can be demonstrated that the ornaments should be surrendered, we may be sure the Trustees will not persist in keeping them, but the removal will cause general regret in this country.

## A FICTION OF THE FINE ARTS.

WHEN all the arts are united, as is commonly the case, as if they were alike not only in their characteristics but in their principles, it is overlooked that architecture differs from the majority of them in regard to what is most essential, and that the difference can never be reconciled. The majority of the arts are simply various forms of fiction. The old rhapsodist who recited scenes in the Trojan war and the painter who attempts to depict those scenes have a common aim, and, as it were, are impelled by the same motive, which is one of deception. HOMER has so convinced the world of the truth of his narrative, and we place in consequence so much reliance upon his imaginative efforts, we have come to esteem his poems as the best basis for the history of Greece during one important period. Judging by what we see in our own time, we may conclude there were Grecian paintings which were accepted by the multitude as presenting types of the heroes which were equivalent to actual portraits. The effort of PHIDIAS, for example, to express in marble the old poet's description of ZEUS is still admired with reverence, as if in some mysterious way it were an embodiment of truth. Or, if we take works of a very different class, which were produced hundreds of years afterwards, there can be no denying that a great many of DICKENS'S characters are supposed to be so lifelike, they have the effect of actual beings on many persons, and even on people who only know of them by hearsay. MR. PICKWICK and his friends are more real to us than the people who were privileged to be the first readers of the adventures. What is more remarkable is the way the illusion has been supported by the illustrations in the novels. HABLÖT BROWNE, who was for so many years DICKENS'S artist, supplemented the written descriptions to such an extent that a modern artist who takes a subject from DICKENS is compelled to become indebted to the old etchings. BROWNE was of a very gentle disposition, and he was not adapted to be successful in representing many of DICKENS'S melodramatic creations; but the bias in favour of the untruthful in art has been so developed in man, he prefers whatever makes the strongest impression on his mind. For many readers BROWNE'S figures have superseded the original descriptions.

A remarkable instance of the power which illusion possesses is to be seen every day in Brussels. The collection of paintings in the Wiertz Museum exemplifies a persistent effort on the part of the painter to deceive. He has so far succeeded that not only is the gallery never empty during the hours it is open, but many strangers from distant countries never fail whenever they visit the Belgian capital to make a pilgrimage to the Musée, as if to renew the pleasure of being duped. It may be said the pictures are not to be considered as works of art in the ordinary sense of the words, and there are many Belgian painters and amateurs who would gladly see the gallery closed and the pictures destroyed, although they know that a room devoted to works by GALLAIT, DE KEYSER, PORTAELS or other modern Belgian masters would not be so continuously attractive to the crowd. But however low the paintings by WIERTZ may be classed, it must be allowed that his offence was the execution on a wholesale scale of effects which from the earliest time were occasionally attempted by painters. The old traditions about birds pecking at the grapes of ZEUXIS, and the acknowledgment by the same ZEUXIS that he attempted to draw aside a curtain which was painted by PARRHASIUS, are enough to suggest the esteem in which deception was held at a time when the human mind was believed to have attained its utmost development. ANNIBALE CARRACCI, we are told, considered BASSANO to be a great painter, not only on account of his vigorous works, but because he was able to imitate "the miracles" of the Greeks by deceiving beasts as well as men through his imitations. What is more, ANNIBALE was not ashamed to own that he endeavoured to take in his hand a book which he believed to be a genuine printed and bound volume, but which was only a stroke of legerdemain on the part of BASSANO. With such examples before us—and many of the same class will be found recorded in the biographies of painters—it would be vain to deny that able artists have taken pleasure in carrying imitation to excess so that spectators might be startled.

From slight and occasional attempts illusions in paint-

ing have grown into a system. At the present time everyone knows there are various schools of realists, or combinations of artists and writers, whose aim is to reproduce nature, however repulsive, with fidelity, in the belief that they are ministering to truth. For many a year painters of panoramas endeavoured to attain that end by the introduction in foregrounds of many natural or genuine objects. But the trick became so manifest it ceased to deceive, and the public preferred paintings in which reality was secured without any aid of the kind. In literature the effort to be realistic has produced books in which old-fashioned decency is not respected, and unnecessary details are heaped up in order to gain the effect of veracity. Once upon a time writers were thought to give whatever was best and most beautiful in life, but those primitive days have vanished, and now it would appear that over many cities and classes of life ugliness reigns supreme. The aim of the author is to reveal all the horrors of reality to those people who decline the trouble of exploration.

What relation can architecture have with the falsities which inspire and pervade the other arts? It may be a fault when room paper representing large slabs of marble is placed on the walls of the hall or the staircase of a humble house, or when the deal doors are grained to look like oak and mahogany. It is also blameworthy in the eyes of rigourists when veneers of marble or plates of pottery are used to conceal materials of another kind. It is also to be deprecated whenever a gate lodge is a copy of a Greek temple, or when a peaceful suburban villa assumes the form of a baronial castle, as was at one time common, or when a ladies' school is made to resemble a miniature abbey. But no one, unless the owners, can be taken in by that class of imitation which has not even the merit of being jocular. They are not to be compared with the musician's efforts when he professes to conjure up by sounds alone a battle, a storm, a fox hunt or a football-match. It is, however, satisfactory to know that the endeavour to substitute one material for another in buildings is yearly becoming more rare in this country. In the course of the century it may be thought very bad taste to adopt even harmless subterfuges in houses.

Whether in the other arts there will be an equal devotion to truth is less certain. It is not so long since a head in which the eyes appeared to open and close at regular intervals attracted crowds who found pleasure in the feat. A piece of white satin with exaggerated sheen is sure to have a circle of admirers in any Academy exhibition, and would secure a high price in the auction-room. It is true all displays of that kind are evidence of dexterity, which in painting is a desirable quality. But what the multitude admire is the power to which they must submit. If a sculptor will condescend to model a veiled vestal or a beggar-boy in rags he can reckon on the purchase of his work. The modern attempts to revive coloured sculpture, made up of several materials, have the same tendency, viz. the astonishment of the public through their ignorance of artistic processes.

Painters and sculptors are not always to be blamed if they flatter the public by appearing to believe that illusion is art. In literature they can see that success is to be gained by what appears to be no more than reports of commonplace talk. The drama also, which is supposed to mirror the very age and body of the time, depends for a profitable run in a large measure on the furniture, the pottery, the carpets supplied by various firms in the neighbourhood of the theatre, and unless actual things are present before their eyes the spectators appear to be incompetent to fancy what they are like from the property-man's work.

The cause of the revolution is to be attributed mainly to the growth of science, which operates in works where imagination used to reign, as it does in the material world. Science is an aid to truth, but it does not enable us to believe we have before us a queen who is "in shape no bigger than an agate stone on the forefinger of an alderman," or a lost cherub whose stature reaches the sky and lies floating many a rood. The Darwinites say that in course of time the progress of civilisation, bringing increased means of locomotion, digestible food and other conveniences, will inevitably convert man into a bald-headed, toothless, weakly creature, for there will be no longer any need of muscle. In the same way science also appears

to be fast leading us to a time when art and literature will consist of documents which will have to be made as rigorously exact as any which are now the subject of lawsuits. Testing will be one of the principal duties of life. The imitative arts will be hardly likely to profit by the change, but there is no reason why architecture should suffer. Then, as now, it may be classed by philosophers with the imitative arts, but it will continue to belong to a different category. In more senses than one it is a creation of man for which nature furnishes no model, and as an art is as far removed from the fictions of the painter and the sculptor as from those of the novelist.

The differences which separated architecture from the other arts were known in Greece in its most intellectual days, and when the arts flourished exceedingly. From the Socratic dialogues we learn that the philosopher's test of art was its correspondence with the end for which it was designed. A golden shield which did not exactly fit the wearer he declared to be ugly. The most beautiful house, he said, was the one that was most convenient, which was so planned that a man might enjoy every season of the year within it, and which would be secure against thieves. He recommended, therefore, that the part of the house towards the south should be much higher than the part which faced the north. Pictures and statues, on the other hand, were not considered to be aids to happiness like the house, and the best use he could discover for them was to exercise an educational influence in contrasting by means of representations men who were honest and amiable with those who were perverse and hateful. In modern times the difference between the two classes of art is overcome by the supposition that the end of all the arts is to give pleasure, and that a house with a handsome façade can become as effective as a picture or a piece of sculpture. But SOCRATES, although he was able to sleep all night outside a house, knew that ordinary men sought for comfort, and that it could become an auxiliary in forming a moral character. Although a sculptor, he knew that a house which was without draughts in winter and contained parts that were cool in summer was preferable to any work of the ordinary artist. The experience of many centuries has confirmed his views, and the main purpose of architecture is overlooked whenever it is judged by the rules which are applicable to statues and pictures, and injury is done to it when it is not allowed to stand supremely apart and to demonstrate its beauty without other aid. That was the light in which SOCRATES saw a building. It pleased him by its convenience, and he declared that no amount of painted or sculptured decoration could compensate for a deficiency in architectural qualities.

#### THE BIBLIOGRAPHY OF HERALDRY.

THE Board of Education have issued an addition to the useful series of classified catalogues of the National Art Library by one relating to heraldry. As a rule students of the science of arms have to depend on public libraries for their authorities, owing to the costliness of the books, which prevent more than a few from being found in an ordinary book-case. Dealers possess sufficient knowledge to be aware that heraldry mainly concerns gentlemen, and they assume that anyone who can claim a long descent or a coat of arms should be able to pay liberally for books which are peculiarly interesting to them. The subject can never be a popular one, and the number of copies of a work on heraldry must therefore be limited; consequently higher prices rule than with the generality of books.

The old-fashioned votaries of heraldry firmly believed that it was at least as old as freemasonry. SHAKESPEARE, who often makes jokes out of the sacred truths of the science, ridicules those who were unable to believe such sublime knowledge as relates to masques, flasks, martlets, rustres, &c., could arise in modern times, by making one of his gravediggers describe ADAM as the first gentleman who bore arms. There appears, however, to be no doubt that in an early age Greek warriors used figures on their shields which modern artists represent as having heraldic characteristics. They may have been intended to indicate fighting men belonging to particular clans, or they may have been

derived from more ancient figures, which, like those on Chinese shields, were credited with striking terror into the hearts of adversaries. Other inquirers would have us believe that heraldry was one of the fruits of the Crusades. The investigation of the subject has given rise to many pleasant disquisitions, and it may be concluded that heraldry itself has undoubtedly sufficient antiquity in its favour to make it fascinating to those whose thoughts are occupied with family history. A modern science is best adapted for those whose pedigrees are not to be traced in the Heralds' College, and who contrive to be useful and happy without hereditary arms.

Heraldry must have existed in a systematic state when RICHARD III. founded the Heralds' College in the parish of All Hallows the Less in the year 1483. Indeed, if we are to accept the authority of a French book dated about 1520, heraldry was respected in England as early as the age of King ARTHUR, for in the South Kensington collection we can see engravings of the arms of the Knights of the Round Table. They are as accurate as many later assumptions. The earliest English writer on the science is believed to be NICOLAS UPTON, who wrote a treatise, "De Militari Officio," in the time of HENRY V., and which was translated by JULIANA BARNES, or BERNERS, in the famous "Boke of St. Albans," of which a modern reproduction of the edition of 1486 is in the Art Library. Heraldry at the time was supposed to exercise educational influence, for the erudite nun professed to be able to teach "how gentylmen shall be knowen from ungentylmen." "Un Traité du Blason du XV<sup>e</sup> Siècle" was written by DOUET D'ARCO. There are several English works on heraldry belonging to the sixteenth century, one being Sir JOHN FERNE's "The Blazon of Gentry, divided into two parts; the first named the Glorie of Generositie; the second Lacyes Nobilitie: comprehending discourses of Armes and of Gentry. Wherein is treated of the beginning, parts and degrees of Gentleness, with her laws: of the bearing and blazon of cote-armors, of the laws of armes and of combats." The title is more high-sounding than is usual in English books. SYLVANUS MORGAN, another writer like FERNE, whose statements are not to be taken on trust, suggests by the title-page the widening of the boundaries of knowledge in the seventeenth century, and the desire of authors to meet the scholar's requirements regardless of the strain which was put upon their imagination. His book is called "The Sphere of Gentry, deduced from the principles of nature: an historical and genealogical work of arms and blazon, in four books. . . . In which is contained the genealogies of the Patriarchs and Heroes, standards of the Jews, hieroglyphics of the Egyptians, symbols of the Grecians, antiquities of the Romans, arms and ensigns of the English nation . . . down to King CHARLES II." ABEL BOYER called his book "The Great Theater of Honour and Nobility." MARC ANTHONY PORN, whose real name was ANTOINE PYRON DU MARTE, a refugee who was a master at Eton, gave the simple title of "The Elements of Heraldry" to his book; but he was complying with English taste, for the French titles are often grandiloquent. Thus one is called "La Science héroïque," another "La Science des hommes de qualité." The Germans resemble the English in their titles, but an author is to be excused if he departed a little in order to suggest the greatness of the science. The Art Library contains 126 publications which can be reckoned as treatises, the last being a paper recently read before the Architectural Association on "Heraldry and Heraldic Ornament," by Mr. H. V. C. SMITH.

Special subjects are more easily treated, and there is not a colour, tincture, ermine, charge, line, label or border which could not be made the subject of a brochure or a volume. There are, for instance, in the Library a dozen separate publications relating to the fleur-de-lis, which some speculators now take to mean "the flower of LOUIS." Next, we have the general collections of arms. The oldest record relating to a roll of arms refers to the nobility who took part in a tournament at Compiègne in 1238, which is now in the Brussels Library. The importance of heraldry is shown by a book on the Council of Constance, published in 1536, in which the arms of those who took part in it are displayed, as if they were of as much importance as the doctrines of WYCLIFFE and HUSS. The collection relating to Great Britain and Ireland is very

extensive, but it mainly applies to England. For in spite of all that is believed about the antiquity of Irish families, heraldry is not much esteemed in the island, and much that passes under the name is very amusing to an expert. The Irish heraldic works in the Library consist of a peerage, an essay on sculptured stones in the county Antrim, descriptions of Cork and Kerry, an account of an Anglo-Norman Church, and of the islet of Devenish in Loch Erne. There are many essays on particular families, in which armorial bearings are introduced. Indeed, the English works form a most interesting assemblage.

Family history with civic and national history are prized by the Belgians. The heraldic works are therefore numerous. Such a book as M. DE VIGNE'S "*Recherches historiques sur les costumes civils et militaires des gildes, et des corporations de métiers, leurs drapeaux, leurs armes, leurs blasons, &c.*," is characteristic of the modern spirit. In France armorial subjects are looked at from a different point of view. The Revolution was a fatal blow to heraldry, but there is interest still taken in the old nobility with their mouldy warrants of superiority. But if numbers of publications can be taken as a test, Germany and Austria-Hungary comes next to Great Britain in the extent of its heraldic bibliography. Turning eastwards, we find Cyprus possessed an armorial. Arms were recognised in Chaldea, but it is remarkable that there is only one reference to India—a cutting from a German newspaper. The arms of the United States have inspired only a single volume. In Japan there appears to be a harvest waiting the heraldic inquirer. Among other subjects which comprise distinct divisions are ecclesiastical and sacred heraldry, orders of chivalry, devices, badges, monograms, crests, mottoes, shield-shapes and supporters, standards, flags, banners, armorial bindings, armorial book-plates, exhibitions, bibliography, periodicals. In addition there is an index to subjects, authors and heraldic artists.

There may be cynics who will believe that the catalogue and the books it records are only aids for the promotion of snobbery. Heraldry has many enemies who look on it as the science of fools with long memories, but they should bear in mind that the representation of arms is required in many kinds of decoration, and a false quantity or a misspelling are trivial lapses compared with the substitution of one kind of hatching for another or for the points which stand for a gold ground. To be a master of the science requires daily practice, but few designers can afford to spend so much time over escutcheons. To take up so delicate a subject is often a very intricate task, and needs reference to many books. That, no doubt, is the primary purpose of the valuable South Kensington collection. But for amateurs who have leisure there are not many more delightful studies. It appeals to human feelings which are innate in all. It is possible, like CORIOLANUS, to try to become master of oneself and to ignore all other kin, but thought cannot help going back through the long line of predecessors which the humblest must possess. Designers and amateurs will find the new catalogue facilitates their researches.

#### A FINE ARTS COMMISSION.

THE following letter from Sir E. J. Poynter has appeared in the *Times* :—

Lord Stanmore's motion in the House of Lords for "a Royal Commission similar in character and object to the Fine Arts Commission of 1842" raised an important question, but it came, as he justly foresaw, to nothing; his lordship "knew that the Government would not do what he asked." The prediction was safe enough. The Prime Minister himself confessed that such a motion was not likely to find a very large sympathy among those who govern the country, and he expressed an opinion that if the work of the Commission was not continued after the lamented and too early death of the Prince Consort it was that "there was no one, there could be no one, fit to take up the work" thus inaugurated and encouraged for the twenty years during which the Commission was in being. The Prince Consort was, no doubt, in an exceptional position for the happy fulfilment of such a task, not only on account of the exceptional enthusiasm which he felt in the encouragement of the fine arts, but because he was too high placed for the administration of the snub with which Governments are too apt to meet the efforts of less exalted individuals in the same direction. But it does not seem indisputable that the work

should necessarily have been dropped when the Commission came to an end; an effort so well begun and so valuable in the interests of the higher forms of fine art and for the decoration of the building on which so much money had been lavished to make it worthy of the nation might very well have been carried on under the successive First Commissioners of Works, one of whose proper functions may be said to be to propose and administer a sum to be voted by Parliament for such purposes; it is, indeed, hardly just to the memory of a most distinguished chief of the Office of Works to state that there was no one fit to succeed to the position which the Prince Consort took in this matter. But Sir Henry Layard was not the Prince Consort; a modest attempt on his part during his brief tenure of the office to continue the decoration of St. Stephen's Hall, at an expenditure of something under 5,000*l.* spread over four years, seems to have inspired the Government with such terror that he was promptly offered a diplomatic post and sent to expend his magnificent energies as ambassador at Madrid; and, in order apparently to accentuate the reasons for his dismissal to what was no doubt a higher, but to a man of Sir Henry Layard's tastes and character a less glorious, position, the place was filled by the notorious Mr. Ayrton, who could, no doubt, be trusted to treat all such non-sensical ideas as the encouragement of the fine arts with the graceful contempt which he displayed for "market-gardeners" in the person of Sir Joseph Hooker.

I refer to this episode of past history because it may account to a considerable extent for the Prince Consort having no successor in his admirable attempt to bring about a renaissance of the higher decorative forms of art in England. That the result was somewhat of a disappointment is not surprising; as Lord Stanmore justly pointed out, the experiment of decorative fresco-painting on a large scale was new to this country, and that there should have been some failures is hardly to be wondered at, but I venture to say that, in spite of the ridicule which was poured on the achievements of the Commission, in consequence no doubt of a serious want of success in some instances, the result as a whole was not unworthy of the effort. Many of the paintings suffered from want of experience on the part of our artists in the material employed, and others no doubt were inadequate for their position through their being entrusted to painters to whom the treatment of great historic subjects was not familiar or congenial. But I have no hesitation in asserting that the series of paintings by Dyce in the Robing-room of the House of Lords, only too little known to artists and the public, will stand comparison for beauty of design and purity of colour, no less than for accomplished workmanship, with the best Italian decorative work of the fifteenth century. Again, the two great paintings by Maclise, full as they are no doubt of strange faults, are at least a serious attempt on the part of the artist to invest with appropriate dignity of style the two greatest episodes of English history; they are the work of a prolific, if somewhat academic, designer endowed with a fiery energy, not seeing his way clearly through a mist of bad and effete tradition, but grappling with unwearied labour with enormous difficulties and displaying qualities well worthy of study and imitation.

But the scoffers indulged themselves freely at the expense of the Commission, and it was partly no doubt due to the indiscriminate ridicule with which its efforts were met that that apathy to which the Prime Minister referred arose in the mind of the public. Ridicule is, however, no test of the merit of a work of art. Witness the ridicule lavished on works, now famous, of Millais and Burne-Jones in their earlier days. To some people all art is ridiculous, and there is no work of art, however great, which does not lie open to criticism from one point of view or another. A most eminent scientific man found the Madonna del San Sisto ridiculous in an argument which I endeavoured to sustain with him, not because he considered it an inadequate treatment of so great a subject, but because, the necessary conventions of art being unintelligible to him, he had discovered that in the radiant light with which Raphael has surrounded the Madonna and Child it would be impossible to distinguish their faces. The ridicule therefore which was showered on the efforts of our painters of the fifties may be set aside as of no account. The moment perhaps was inauspicious for the general production of great work. The best men of the late generation had not come forward at the commencement of the Commission. Leighton, Millais, Burne-Jones and Albert Moore were still at school, and up to the end of the sittings of the Commission only one work had been entrusted to Watts—a work which subsequently no doubt suffered great deterioration from the imperfect knowledge of fresco-painting which prevailed at the time, but which deserved a better fate than (in common with six other panels in the upper lobby) to be pasted over with wall-paper. Why, indeed, as Lord Stanmore asked the House of Lords, should not some effort have been made to restore these paintings, like those in the Lords' Chamber, instead of subjecting them to this ignominious treatment?

It was precisely since the labours of the Commission terminated that our best masters of decorative painting came

into prominence, and yet during these forty years not one of their works has been in requisition for the decoration of the Palace of Westminster. Two mosaics have been placed in St. Stephen's Hall, one in the time of Sir Henry Layard, as part of his general scheme for its decoration, and another, after an interval of thirty years, under the régime of Mr. Plunket. This and the papering over of the seven pictures already executed in the upper lobby are the solitary contributions which successive Governments have made during forty years towards completing the scheme of the Royal Commission presided over by the Prince Consort.

Is Lord Stanmore really asking for any abnormal or excessive effort on the part of the Government in moving that a body should be appointed having power over the expenditure of a small annual amount to carry on with some continuity the very reasonable desires of the Prince Consort's Commission? At present such efforts are purely spasmodic and capricious, depending on the individual taste of the First Commissioner of Works for the time being, subject to stern repression by the Treasury. No doubt Sir Henry Layard's fate has acted as a deterrent on subsequent First Commissioners. Further, is it certainly a good thing, as Lord Rosebery suggested, that the Government does little for art? It appears to me that a Government, by commissioning such paintings as those by Dyce and MacIise, to which I have referred, does what it is not in the power of private individuals to effect. Municipal bodies doubtless can, and do occasionally, make a generous movement in the encouragement of monumental works; Madox Brown, for instance, was for years engaged on, and fortunately lived to complete the remarkable series of paintings commissioned for the Town Hall at Manchester. Such undertakings may be considered to have resulted from the initiative of the Royal Commission of 1842. The Government is, in fact, in a position to set the example in these matters, and I am of opinion that it is of immense advantage to the practice of the fine arts that they should exercise their powers in this respect. The mere fact that an artist, especially if he be young, receives a commission from the State gives a stimulus to his energies which no lesser form of patronage can supply; and when a series of works such as those for the decoration of Westminster Palace brings various painters into competition with each other the sense of emulation comes in to call out their best energies, while the scale on which such works are required and the class of subject with which they have to deal are important factors in the production of great work. The artist feels also a certain pride in the thought that he is emulating the achievements of the great masters of past times, and he has the consciousness, which puts him on his mettle, that his commission is of national importance and will stand before the eyes of the nation for its judgment.

The following question has nothing to do with the subject of this letter, but as there will be a meeting of the County Council when the subject of the widening of Piccadilly will again come before it, I am tempted to ask what real necessity there is for widening Piccadilly along the side of the Green Park? Any enlargement of the road between Hyde Park Corner and Down Street will seriously interfere with the most attractive part of the Park, and whatever blocks of traffic occur arise from the cross traffic at Hamilton Place and Berkeley Street, not from undue narrowness of the road.

#### OXFORD.\*

LINCOLN COLLEGE was founded in 1429 by Richard Fleming, Bishop of Lincoln, who was a native of Yorkshire, and received his education at Oxford. In his graduate days he was a follower of Wycliffe, but subsequently, regarding the movement with alarm, he decided to found this College to refute Wycliffe's doctrines. He obtained his Charter from Henry VI, dated October 13, 1427, incorporating the Churches of All Saints, St. Mildred and St. Michael, which he united into a Collegiate Church under the title of "The College of the Blessed Mary and All Saints, Lincoln, in the University of Oxford." He died suddenly on January 25, 1430-31, before his plans were completed. The present Tower and rooms over the Gateway were alone finished, the students occupying Little Deep Hall in St. Mildred's Lane (now Brasenose Lane). John Forest, Dean of Wells, continued the foundation, and before 1437 had built the Hall, Chapel (now the Library), and rooms for the Fellows and students. The old Kitchen, which is supposed to have belonged to Winchester Hall, was repaired by Dean Forest, and is still used by the College. A second Charter, confirming the rights of the College, was obtained from Edward IV., dated January 23, 1461-62. The site was considerably increased by the purchase of other Halls adjoining in 1463, and in the following year the executors of Bishop Thomas Beckington gave 200*l.* for building

the Rector's house, on the west front of which may be seen his rebus, T, and a beacon set in a barrel. In 1475 Thomas Rotherham, Bishop of Lincoln, Visitor of the College, and Lord High Chancellor, greatly increased the endowment, and completed the front quadrangle by building the south side. He also obtained an enlarged Charter from Edward IV., dated June 16, 1478, and gave a new and more complete set of Statutes framed on those of the Founder. Other benefactions followed, among them being Dagville's Hall in 1488, now the Mitre Hotel. In 1610 Sir Thomas Rotherham, a descendant of the Lord High Chancellor, built the west side of the Chapel quadrangle, John Williams, Bishop of Lincoln, adding the east side and the Chapel in 1628-31. The battlements round the front quadrangle were put up in 1850. Dr. John Radcliffe, the Founder of the Radcliffe Library, and John Wesley, whose rooms are said to be those over the passage leading from the front to the Chapel quadrangle, were Fellows of the College.

The Hall was erected in 1436 by John Forest, Dean of Wells. It is a handsome chamber with chestnut timber roof and louver. In 1697-1701 Nathaniel, Lord Crewe, Bishop of Oxford and Durham, repaired the Hall, adding the present wainscoting and covering the old roof with a waggon roof of plaster. This was removed in 1889 under the direction of Mr. T. G. Jackson, R.A., and the windows and other portions were restored to their original design. On the walls are portraits of the Founder, Bishop Rotherham, Sir Nathaniel Lloyd, Lord Keeper Williams, Lord Crewe, Mark Pattison (late Rector) by A. Macdonald, Rev. W. W. Merry, D.D. (present Rector), and others. The Buttery is of the same date as the Hall.

The Library, formerly the Chapel of Dean Forest's foundation, was converted to its present purpose in 1656 by John, Lord Crewe of Steane (father of Nathaniel). Several MSS., chiefly theological, were bequeathed to the Library by Bishop Fleming; twelve were given by Thomas Gascoigne in 1432, and Dean Fleming, nephew of the Founder, in 1456 gave thirty-eight others, mostly Latin authors. Fortunately many of these valuable works escaped the ravages of Edward IV.'s Commissioners. Other benefactions followed, among them a bequest by Robert Deighton of the works of St. Augustine, St. Gregory, St. Ambrose, St. Jerome and St. Chrysostom; by Dr. G. Watts, in 1656; Sir Nathaniel Lloyd, at whose expense the Library was fitted up in the early part of the eighteenth century; and the Rev. Sir George Wheeler. Gascoigne's "Dictionarium Theologicum" and a manuscript of Wycliffe's Bible are among the much-valued treasures of the Library.

The Chapel, built in 1628-31 by John Williams, Bishop of Lincoln, Archbishop of York, and Lord Keeper, was consecrated on September 15, 1631. It was repaired and beautified in 1686, at the cost of Rector FitzHerbert Adams. The ceiling, the handsome screen and the front of the stalls, with the beautiful carved statuettes of Moses, Aaron, the four Evangelists, St. Peter and St. Paul, are of cedar wood. The stained-glass windows are particularly fine. They were brought from Italy in 1629 and given to the College by Bishop Williams. The east window represents events from the life of our Saviour with the antetypes in the Old Testament; those on the south side represent the twelve Apostles, and on the north twelve of the Prophets. These windows are said to have been painted by Abbott, brother of the Archbishop of that name. Wesley's pulpit stands in the ante-chapel.

Ant. Wood says of the early Chapel of the College:—"St. Mildred's Church was first used by the Society as their Chapel, but being in great decay was pulled down and an Oratory, with the chambers underneath, was built with the stones thereof, partly on the site of said Church, by John Forest in 1436. It was continued in use until 1631, and in 1656 was converted into the Library."

Exeter College, originally known as Stapelton Hall, was founded in 1314 by Walter de Stapelton, Bishop of Exeter, for thirteen scholars from the counties of Devon and Cornwall. Bishop Stapelton held at various times the positions of Chaplain to the Pope, Lord High Chancellor, and Secretary of State to Edward II. His loyalty to the King led to his untimely death, he being murdered by the London mob in front of St. Paul's Cathedral in 1326, before his College was completed. He first acquired Hert Hall, now the site of Hertford College, but in 1315 removed his foundation to St. Stephen's Hall, the present site. A second Founder arose in Edmund Stafford, Bishop of Exeter, Keeper of the Privy Seal, and Chancellor of England. He altered the name to Exeter College, framed new Statutes embodying the plans of his predecessor, and added to and improved the existing buildings. In 1565 the College was incorporated by Charter of Queen Elizabeth, when Sir William Petre, Secretary of State and Privy Councillor to Henry VIII, Edward VI. and Queens Mary and Elizabeth, became a third Founder and munificent Benefactor. The buildings have been subjected to many alterations from time to time, and of the early work all that remains is the old Gate Tower erected by William Palmer, Rector, in 1432, which now forms part of the Rector's House, the Hall and Perriam's buildings on the east side of the Quadrangle.

\* A paper read by Mr. Frank E. Spiers before the members of the Upper Norwood Athenæum at Oxford on July 13.

The Hall, which stands on or near the site of St. Mildred's Church, was built in 1618, chiefly at the cost of Sir John Acland. It has a fine high-pitched timber roof, and an exceedingly good Jacobean screen. On the walls are portraits of the Founder, Walter de Stapelton, Charles I., Sir William Petre, Kt., LL.D., 1571, Dr. Prideaux, 1612, Sir John Acland, Bart., 1618, Lord Chancellor Shaftesbury, 1672, Archbishop Secker, 1768, Lord Coleridge, Seldon, the antiquary, Sir Charles Lyell, geologist, and many others.

The Founder's Chapel is supposed to have been on the site of the present Library in 'the Fellows' garden. A new Chapel was built in 1624 in the front quadrangle, but being condemned as unsafe the present Chapel was erected in its place in 1856-58 from designs by Sir G. G. Scott, R.A., it being to a great extent a copy of "Sainte-Chapelle" in Paris, and in every way an exquisite building. Statues of Bishop Stapelton and Sir William Petre are on either side of the entrance. It has a fine stone vaulted roof, 84 feet high, and arcades in carved oak, the length of the building being 91 feet by 30 feet wide. The apsidal east end is embellished with mosaics by Salvati. The beautiful tapestry which adorns the south side was executed in 1890, at the Merton Abbey Works, by the late William Morris, from designs by Sir Edward Burne-Jones, A.R.A., and represents "The Adoration of the Magi." The bronze Eagle is from the old Chapel, and was presented to the College in 1637. By the entrance is a fine carved pedestal alms-box of the fifteenth century.

The Library, standing on the site of the Founder's Chapel, is situated in the Fellows' Garden, and was built in 1856 from designs by Sir G. G. Scott in the Early Gothic style. It contains some good manuscripts of the fourteenth century given by Bishop Rede, of Chichester, astronomical and mathematical works given by Simon de Bredon in 1372, and other books of much value and interest, among them being a highly-prized Latin Psalter that belonged to Henry VII., in which are recorded the births of the Tudor family and an account of the battle of Bosworth Field.

In the Fellows' garden is a grand old chestnut tree, known as Heber's chestnut, it having shaded the windows of his rooms in Brasenose College, and Kennicot's fig tree, brought from Smyrna in the reign of Charles II., and still growing vigorously on the old buildings.

Trinity College was founded in 1555 and was dedicated to "The Holy and Undivided Trinity" by Sir Thomas Pope, Knight, Treasurer of the Court of Augmentations, Privy Councillor to Henry VIII. and Queen Mary, and custodian of the Princess Elizabeth at Hatfield. It stands on the site of Durham College, founded by the Benedictine Monks of Durham in 1286, and was the first College founded in Oxford after the Dissolution of Monasteries. Sir Thomas was born at Deddington in Oxfordshire in 1508, and educated at Banbury and Eton. He obtained the Royal License to found his College on March 1, 1554-55. He repaired the old monastic buildings, and it was not until 1618 that any new buildings were erected, when Sir William Pope, the first Earl of Downe, a relation of the Founder, built the present Chapel Quadrangle. Dr. Kettel, President from 1598 to 1643, rebuilt the Hall, added several outbuildings and "cock lofts," as Ant. Wood describes them, and the picturesque building in Broad Street on the site of "Perilous" Hall, known as Kettel Hall. Dr. Ralph Bathurst, President from 1664 to 1706, built the north side of the Garden quadrangle in 1665 and the west side in 1682 from designs by Wren, and later the Chapel and Tower Gateway. He was the first to introduce Classic architecture into the College buildings of Oxford. The south side of the inner quadrangle was added in 1728. The new buildings in the front quadrangle, including the President's lodgings, were built in 1883-87 from designs by Mr. T. G. Jackson, R.A.

The Chapel, with the Tower Gateway, surmounted by four figures, of Divinity, Physic, Geometry and Astronomy, was built by Dr. Ralph Bathurst, in 1691-94, on the site of the fourteenth-century Chapel, from designs suggested by Sir Christopher Wren and carried out by Dean Aldridge. It was consecrated by John Hough, Bishop of Oxford, on April 12, 1694. The Altar-piece and Screen are of cedar and lime, and are exquisitely carved, the work of Grinling Gibbons. The ceiling was painted by Peter Buchet, a French artist, and represents "The Ascension." On the north of the Altar is the tomb of the Founder, in alabaster, a very fine work, with his recumbent effigy in complete armour, and that of his wife. The stained-glass windows are modern, one on the south side having been recently filled with glass from Munich to the memory of the Rev. Isaac Williams, a Fellow, and seven others representing the Durham College Saints, given by the Rev. H. G. Woods, late President. An elaborate silver-gilt Chalice from St. Albans Abbey, given by the Founder, is highly treasured.

The Library is the original building of the Benedictine Monks, was erected about 1417, and formerly contained the valuable collection of books bequeathed to Durham College in

1344 by Richard de Bury, Bishop of Durham and author of "Philobiblion." It contains a curious manuscript of "Euclid" of the twelfth or thirteenth century and a valuable collection of topographical and antiquarian works, bequeathed by Dr. James Ingram in 1850. The bookcases were fitted up in 1605. The stained-glass windows on the east side date from the fifteenth century and were taken from the old Chapel; they bear the figures of Edward III., Philippa, the Evangelists, St. Cuthbert and St. Thomas à Becket with FitzUrge's dagger in his forehead.

The Hall was built in 1618-20, and is said to be on the site of the old Refectory. Over the entrance is a statue of the Founder, Sir Thomas Pope. The ceiling and wainscoting were put up about 1777, but the ceiling was reconstructed early in the last century. On the walls are portraits of the Founder and Lady Elizabeth Paulet, his third wife, Archbishop Sheldon, Dr. Kettel (President 1598 to 1643), Dr. Bathurst (President 1664 to 1706), by Kneller, William Pitt, Earl of Chatham, Roundell Palmer, D.C.L., Earl Selborne and Lord High Chancellor (1880), Cardinal Newman (1877), Dr. Stubbs, late Bishop of Oxford, and others.

The Gardens are well kept, their chief attraction being the celebrated avenue of limes known as the Gothic Walk.

Balliol College was founded about 1260 by John de Balliol, of Barnard Castle, Durham, father of John Balliol, King of Scotland, and the Lady Dervorguilla, his wife, daughter of Alan, Prince of Galloway. The origin of the foundation is as follows:—Balliol having had trouble with the Bishop of Durham, and having treated him with some indignity, to condone his offence suffered scourging at the hands of the Bishop before the entrance of Durham Cathedral, and, further, assigned a sum of fixed maintenance to be continued for ever to sixteen poor scholars studying at Oxford. He died in 1269, before his plans were completed, and charged his wife to continue the maintenance and endow the community. The College was dedicated to "The honour of the Holy Trinity, the Virgin Mary, St. Catherine and the whole Court of Heaven." It was not until 1282 that the House of Balliol was permanently endowed and received its Statutes, which bear the seal of the Foundress. Dervorguilla died on January 21, 1290, at Castle Barnard, and was buried at Sweetheart Abbey (Dulce-Cor), in Galloway, a Cistercian monastery she had built and endowed. Nothing is left of the original buildings, though the ground plan has been to a great extent preserved. The south front, built in the reign of Henry VI., was pulled down in 1867, and rebuilt from designs by Mr. Waterhouse. The buildings at the south-west corner of the College were erected in 1769 by Mr. Fisher, Master, the rooms facing St. Mary Magdalene Church in 1825 from designs by Mr. George Basevi, and the buildings north of this, facing the Martyrs' memorial, in 1855 by Mr. Salvin, architect.

A License was granted in 1293 by the Bishop of Lincoln to hold Divine Service in an Oratory in the College, and about this time the first Chapel was erected on the site of the present dining-room of the Master's house; it was rebuilt in the fifteenth century. The oriel window in the front quadrangle will indicate the position. A new Chapel was erected in 1521-29, the site selected being to the east of the Library. It was a handsome building, but in 1856 was removed, and the present Chapel built on its site at a cost of 8,000*l.* as a memorial to Dr. Jenkins, the late Master, who died in 1854, Mr. Butterfield, F.S.A., being the architect. It is a building of red and white stone in bands, in the Decorated style. The east end is embellished with Derbyshire alabaster, on the north side being the Jowett memorial by Mr. E. Onslow Ford, R.A., an exquisite miniature recumbent effigy of the last Master, who died in 1870. The Screen is of wrought-iron and stone and bears the memorial inscription to Dr. Jenkins. Some of the windows date from the fourteenth century, and were in the first Chapel; two representing The Passion, Resurrection and Ascension are of the time of Henry VIII., and were removed from the east window of the former Chapel; two with Saints are probably of the same period; and four, dated 1637, are fine specimens of the work of Abraham Van Ling (two of these are in the ante-chapel). The bronze Eagle was given by Edward Wilson in the reign of Charles II.

The Library adjoins the Chapel, the west part having been built by Thomas Chase, Master, in 1428-31, and the east by Robert Abdy, Master, in 1477-80. It contains choice and precious MSS. given by Bishop Gray, of Ely, and Gascoigne, Chancellor of the University, books on astronomy and mathematics bequeathed by Simon de Bredon, Galen's works left by Stephen de Cornubia, early bibles and other theological and miscellaneous works. One of the most valued treasures in the Library is the original copy of the Statutes bearing Dervorguilla's seal. There is also some good sixteenth-century glass from the old Chapel in windows of the lower room.

The old Hall dates from the early part of the fifteenth century, and is probably the oldest part of the College remaining. It is now used as a reading-room. In the windows some fine glass dated 1536.

The new Hall on the north side of the garden quadrangle is a very fine building 90 feet long by 36 wide. It was built in 1877 from designs by Mr. A. Waterhouse, R.A., in the Decorated style. It contains portraits of the Founder and Foundress, John Wycliff (Master, 1360-66), Cardinal Manning, Archbishop Tait (Tutor), Viscount Peel (the present Visitor of the College), by Herkomer, Dr. Jenkins (Master, 1819-54), Dr. Jowett (Master, 1870-93), by G. F. Watts, Rev. W. Rogers ("Hang Theology" Rogers), Sir Robert Maurier, Robert Browning, J. L. Strachan Davidson, M.A. (Senior Dean), by Herkomer, and many others; there is also a bust of Lord Bowen.

Roger Bacon, Duns Scotus and Occham were trained at Balliol; Humphrey, Duke of Gloucester, studied here, and John Wycliffe was Master. John Evelyn, Adam Smith (1740-47), Southey, Lockhart, Algernon C. Swinburne, Robert Browning, Andrew Lang and many others have shed a lustre on the College by their learning and the high distinction they have attained in after life.

The University Galleries were built in 1845 from designs by C. R. Cockerell, R.A. In the entrance gallery are ancient marbles, including the Arundel and Pomfret collections. In the rooms beyond, antique casts from the archaic period to the fifth century, and in the basement inscribed marbles and the Chantry collection of casts. The galleries above contain a valuable and interesting collection of paintings and drawings by Guardi, Canaletto, Adrian van Ostade, Teniers, Vandyke, Hogarth, Sir Joshua Reynolds, Turner, Herkomer, Millais, Holman Hunt, D. G. Rossetti and others. A series of 190 original drawings by Michel Angelo and Raphael, copies of Raphael's cartoons, water-colour drawings by Turner, sketches by George Jones, R.A., the Douce collection of early German and Italian prints, and the Chambers Hall collection of etchings and drawings by Rembrandt and others. Here is also the Ruskin Drawing School and an Art Reference Library.

*The Ashmolean Museum.*—In 1895 additional rooms were added at the back of the University Galleries for the reception of portions of the collection in the Ashmolean Museum. It will not be out of place here to give a brief history of this celebrated collection. John Tradescant, a Dutch merchant, being banished from Holland early in the seventeenth century, settled in London. He was learned in botany and horticulture, and became gardener to James I., who sent him to the East and to the islands of the Mediterranean to collect plants. He founded a museum in South Lambeth known as "Tradescant's Ark," which contained objects of natural history, antiquities and curiosities, and was the earliest collection of the kind probably in existence. He died in 1638, and was succeeded by his son, who continued the exhibition, and, by the patronage of many persons of note, including Charles II., Queen Mary, Laud and others, added considerably to it. A catalogue of the Museum Tradescantianum was published in 1656. At his death in 1667 he bequeathed his collection to his friend, Elias Ashmole, who had lodged with him for many years. Ashmole was an antiquary, and had for many years been a collector of old manuscripts, pictures, coins and other rarities. He offered to present the whole collection to the University if they would build a museum to receive it. The offer was accepted, and on May 24, 1683, the Museum Ashmoleanum, in Broad Street, was opened. Valuable additions were made to the collection from time to time. In 1895 it was distributed: the Ashmole MSS. and coins, Sir William Dugdale's and Anthony Wood's libraries went to the Bodleian; the ethnological (excepting Tradescant's) and the natural history objects to the University Museum in the Parks, and the remainder to the new fireproof rooms, where they are now arranged. The present collection comprises (1) the Tradescant ivories, Mediæval arms and ornaments, historical relics and the earliest ethnological collection in Europe; (2) Egyptian and Oriental antiquities; (3) Classical antiquities, including Greek vases, Greek and Roman pottery, jewellery, terra-cottas and ancient gems; (4) Prehistoric antiquities, Greek and Roman, British of the Stone, Bronze and Early Iron Ages, Irish weapons, &c.; (5) Anglo-Saxon relics, many from cemeteries in the neighbourhood of Oxford and at Fairford, and the beautiful specimen of enamelled gold-work found in 1693 in the Isle of Athelney, and presented to the Museum by Thomas Palmer in 1718, known as "King Alfred's Jewel," it bearing the inscription "ÆLFRED MEE NEHT GEVVRCAN" ("Alfred ordered me to be made"); (6) Oxford antiquities and historical relics; (7) Classical and Renaissance bronzes and terra-cottas, Italian majolicas bequeathed by Dr. C. D. E. Fortnum, foreign rings, watches, fictile ivories, &c.

The Sheldonian Theatre was erected in 1664-69 at the cost of Archbishop Sheldon, Chancellor of the University, from designs by Sir Christopher Wren. Its form is an ellipse, the interior area being eighty feet by seventy feet. The ceiling was painted by Robert Streater, Court painter to Charles II., and represents "The Triumph of Religion, Art and Science over Envy, Rapine and Ignorance." It has been recently

thoroughly restored and cleaned under the direction of Mr. Arthur H. Church, M.A., F.R.S., F.S.A., Professor of Chemistry at the Royal Academy. The organ, by Willis, was erected in 1877, the front having been designed by Mr. T. G. Jackson. On the walls are portraits of the Founder, Sir Christopher Wren, Nathaniel Lord Crewe and the Duke of Ormond. Above is a large chamber that was originally used as the University Printing Press, and the building is surmounted by a cupola from which a very fine view of the buildings of Oxford may be obtained. Here is held the Encenia or Commemoration of the Founders and Benefactors of the University, when the Creweian oration is delivered, the prize compositions are recited, and the Honorary Degrees of D.C.L. are conferred by the Vice-Chancellor. The building will accommodate upwards of three thousand persons.

St. Mary Magdalene Church dates from before the Norman Conquest. Robert D'Oili, in 1074, gave it to the Collegiate Church of St. George, which he had founded in Oxford Castle, and being in a ruinous state, in 1080 it was restored by him. It was transferred by his nephew, Robert D'Oili, the younger, to Oseney Abbey in 1129, who held it until the Dissolution, when Henry VIII. made it over to Christ Church, and it has ever since remained under their patronage. The Church has undergone many changes from time to time, but owing to the manner of the restorations it is difficult to tell what old work remains, if we except perhaps the lower portion of the tower with its large rough-hewn stones. Hugh, of Lincoln, whose work is also seen in St. Mary's and St. Giles's churches, rebuilt the nave in about 1194, and added the north and south aisles, the latter being founded as a chantry, dedicated to the Virgin Mary. The north aisle was repaired and refitted in 1280 by the Lady Dervorguilla, of Balliol, and dedicated to St. Catherine, as an Oratory for the students of her College, and was used by them until the Oratory in the College was built. Balliol still possesses some rights in the Church. The Chapel on the extreme south of the Church, with crypt beneath and elegant parapet of trefoil work, was built in 1320 and dedicated to "Our Lady of Mount Carmel," as a Chapel for the Carmelites or Whitefriars—who in 1314 had been granted Beaumont Palace as a residence by Edward II.—and which they used until 1541, when the side arches were opened up and the Chapel thrown into the Church. The tower was rebuilt in 1511-31, with stones brought from Rewley Abbey, which was then being demolished. The small figure of the Magdalen on the west side of the tower is also said to have been brought from Rewley Abbey. The north aisle was rebuilt in 1841-42 from designs by Scott and Moffat as part of the memorial to Ridley, Latimer and Cranmer, and is now known as the Martyrs' aisle. In it is preserved the door of the cell in Bocardo Prison, over the north gate of the city, in which the Martyrs were confined prior to their execution. The tower was restored in 1875, and many alterations and improvements have been made to the interior of the Church since. The font is an exceedingly good specimen of Decorated work. A very fine carved oak jewel chest of the time of Henry VIII. stands in the Martyrs' aisle. The carved oak reredos, with figures of the Saints connected with the history of the Church, was erected in 1894 from designs by Mr. W. H. Moore, architect, of Oxford. There are old brasses to the memory of Philippa Caxton, 1514, Jane FitzHerbert, 1574, a palimpsest, General Smithers, 1580, and Dr. William Smith, Fellow of Merton, 1580. The register dates from 1602. A peculiarity of the Church is that its width is greater than its length.

In conclusion, I have to acknowledge the valuable information I have obtained from the following works:—"The Colleges of Oxford" and "Lincoln College," by Andrew Clark, M.A.; "Balliol College," by H. W. Carless Davis, M.A.; "Early History of Balliol College," by the Baroness de Paravicini; "Oxford and its Colleges," by J. Wells, M.A.; "Historical Handbook of Oxford," by James T. Moore, and the very excellent guide-books by James Parker and E. C. Alden; and personally to the Rector of Lincoln, Mr. W. H. Stevenson, M.A., of Exeter, the President of Trinity, the Master of Balliol, Mr. J. L. Strachan-Davidson, M.A., Rev. Horace E. Clayton, Vicar of St. Mary Magdalene Church, and Mr. Alexander Macdonald, Keeper of the University Galleries, for facilities given the Society to see over their buildings, and for information and assistance given me in preparing my paper.

**The Design** submitted in a recent limited competition for the United Methodist Free church and schools, Westcliffe-on-Sea, by Messrs. George Baines, F.R.I.B.A., and Reginald Palmer Baines, architects, 5 Clement's Inn, Strand, W.C., has been adopted by the committee, and the first portion of the scheme, including church, vestries, &c., is to be proceeded with at once.

## NOTES AND COMMENTS.

ACCORDING to a former secretary of the Italian Embassy in Paris, France is unique in paying higher wages to women as models than to men. By Italian artists masculine and feminine models are paid at the same rate. In Japan, where at last the use of models is becoming more general, the price paid in the principal art school is 6 sen a day for a young child, 40 for a young woman and 60 for a young man—a sen being about an English halfpenny in value. The sum paid to female models in the Ecole des Beaux-Arts in Paris is 36 francs a week for four hours posing on each week-day. The men receive 30 francs and children 15 francs for the same number of hours. In some schools the prices vary according to the time of employment. From eight o'clock in the morning until noon the tariff is 20 or 24 francs a week, and 18 to 20 francs for sittings for four hours in the afternoon. Those who pose from eight to ten at night are paid 12 francs a week. As a rule artists pay a woman 5 francs for four hours and a man 4 francs. There is a regular market of models in Paris every Monday morning from eight to ten, for they may be engaged in the Grande-Chaumière, but in the Place Pigalle models take up positions near the railing of the fountain every day.

A CURIOUS dispute relating to a building is now before the Chancery Division of the High Court. Lord WINDSOR granted a conveyance of part of his property at Barnet Green, Worcestershire. From the purchaser some of the land was bought by Mr. A. J. LEESON. In the deed was a stipulation that no building was to be erected on the land within 60 feet of the boundary. Mr. LEESON explained that he had obtained from Lord WINDSOR's representative permission to build on the land according to the arrangements shown upon a plan which was submitted for approval. Application was made, however, in the Court for an order on Mr. LEESON, his architect, contractor, &c., to restrain them from erecting any building on the ground without written authority. Mr. Justice KEKEWICH, who heard the application, recognised its difficulty, for his Lordship said if he granted the injunction it would stop the building, and put the defendant in a very awkward position, because he had entered into a contract for building and might be liable to damages. If, on the other hand, he did not grant an injunction defendant would go on building at his own risk, and he would have an opportunity of hearing a little more about the matter later on. He thought the better plan would be to leave the parties to take such steps as they were advised, and to make no order except that the costs of the motion be costs in the action.

ALTHOUGH MILLET, the painter of the *Angelus* and other scenes of peasant life, was supposed to have renounced the vanities which were believed to be fatal to artists in Paris, he was not less anxious about his fame than any fashionable portraitist. Some curious letters from him exemplifying his desire to be valued as a master have appeared in the last part of the *Gazette des Beaux-Arts*. They were written to ALFRED SENSIER, a journalist, and contain suggestions about articles to be written in favour of MILLET. It was pointed out by the painter that his peasants differed from COURBET's, because he possessed a more close acquaintance with life in the fields and huts. He looked on himself as belonging to the class of men who were decreed long ago to eat their bread in the sweat of their brows. The explanation of his (MILLET's) position in art was more deserving of attention by a skilled and honest writer than any of those subjects which trouble opinion instead of guiding it. MILLET said he was without any pretension to be taken for a standard-bearer in art, but he had also resolved to avoid enrolling himself under another man's standard. He was not desirous to be assimilated with anybody, or to walk in others' footsteps, and he had within him the motive power to secure consistency. The honest acknowledgment of his feelings will make many understand MILLET's simplicity and resolution.

It does not take much at the present time to put a stop to building in a town, and local authorities should remember that fact when they are arranging by-laws. In South Shields a proposal that in small houses there should be a space of 20 feet between the staircase and the wall of

the back-yard has raised an obstacle to the entering into building contracts, causing many men to be without employment. At the present time it appears there is no building estate in South Shields in which the distance between the two points is 20 feet. What is desired by the builders is that the measurement should be taken as the distance to the centre of the back street. It is the duty of a local authority to endeavour to raise the character of the town, and it would be an advantage if a distance of 20 feet between the staircase and the end wall could be found in all houses; but land has been purchased and various arrangements made about building on the assumption that a lesser distance will be approved. It ought to be a general rule that when such important alterations are in contemplation notices should be given in order that builders and speculators may not be taken unawares.

A SUM of 35% is of little importance to a firm such as Messrs. JOHN AIRD & SON, but for the principle involved the claim was worth contesting. The case should be taken as a warning by all contractors who have to dig trenches in roads or streets. In April last Messrs. AIRD were laying gas mains in Brighton. According to the Act relating to such work, trenches are to be fenced and guarded. It happened, however, that one of the trenches was only fenced on three sides. On the day in question a farrier's son brought back a cob to its owner, but as the people were not ready to receive it he obtained permission to ride it to Messrs. AIRD's office in order to deliver a bill. There was no necessity for the messenger to become an equestrian in order to give in a bill or to ride bare-backed. He pulled up at the trench. The horse got restive and bounded into the trench at the unfenced side. Now there could be no doubt that the lad was a trespasser, for it is not usual to deliver bills in an open trench when there is an office. On the other hand, there could be no question about the trench being unfenced during a space of five minutes when the accident occurred. The jury gave a verdict to the owner of the horse, and judgment was entered for 35%, the amount claimed, with costs. The moral to be drawn from the proceedings is that it is risky to neglect putting a pole to fence a trench for even a couple of minutes.

THERE will be grand doings in Dublin from August 19 to 26, for it has been arranged that representatives of "the sea-divided Gael" are to meet for the consideration of subjects relating to themselves, as well as to Celtic art and literature. Brittany is to send a numerous deputation, and political and other contests have been suspended in order that the envoys may be worthy of the position of the Bretons. The principal object of the meeting is to demonstrate that the Celt is irrepressible, and can preserve his racial characteristics in spite of all the efforts of the rival Anglo-Saxon and Germanic races. It is to be regretted that before so opportune an occasion presented itself such critics as MATTHEW ARNOLD and ERNEST RENAN have passed away, for their counsel would have been invaluable. During the whole of the nineteenth century there were no men who did so much to claim consideration for the Celtic element in art and literature.

# BRITISH ROYAL PAVILION, PARIS EXHIBITION, 1900.\*

THE arrangement adopted in the Exhibition of 1900, of grouping the exhibits by classes, instead of, as had previously been done, by countries, entirely altered the rôle of the national pavilions. In former exhibitions the pavilions were little more than ornate kiosks, which served as the administrative offices of the national commissions. In 1900, there being no comprehensive national sections, and consequently no positions appropriate for the pavilions amidst the exhibits, the administration of the Exhibition resolved to group them together, so as to form a street—the Rue des Nations—and required that the buildings should be of a more important character than it had previously been the custom to erect. Their views having been transmitted to the Royal Commission, it was decided to entrust the execution of the project to a special committee, and the following members consented to serve:—Major-General Sir Arthur E. A. Ellis, K.C.V.O., chairman; Baron Ferdinand de Rothschild, Sir William Agnew, Bart., Sir John Murray Scott, Bart., Professor G. Aitchison, R.A., president of the Royal Institute of British Architects, Mr. C. Purdon Clarke, C.I.E., and Colonel Sir Herbert Jekyll, K.C.M.G., secretary of the Royal Commission.

The committee met for the first time on May 18, 1898, and Mr. H. Thomson Lyon, F.S.A., was appointed honorary secretary.

In January of the following year the committee had to deplore the loss, by death of one of its members, Baron Ferdinand de Rothschild. The names of Sir Charles Tennant, Bart., and Mr. Montague Guest were subsequently added to the list of the committee.

The reference to the committee was as follows:—

"A site measuring 25 m. by 28 m. 50 on the Quai d'Orsay has been reserved for the British pavilion.

"The main conditions imposed by the French authorities are:—1. That the building should be characteristic in style; 2. That it should be attractive to the public; 3. That it should not be used as an office.

"It is proposed that the British pavilion should take the form of an Elizabethan or Jacobean house, fitted up and furnished like an English country house of the present day, and with selected furniture of British and Irish manufacture of different periods, and with a few fine works of art.

"Decorators and manufacturers of furniture and building appliances would be given opportunities of contributing, and their contributions would be regarded as exhibits.

"It is further proposed to take as a model for the exterior a house at Bradford-on-Avon, built at the beginning of the seventeenth century. The interior would be arranged to meet the special requirements of the case.

"When the Prince of Wales is in Paris the pavilion would be reserved for the use of His Royal Highness during the hours the Exhibition is open. On other days it would be open to the public under regulations to be decided upon.

"The attic storey might be approached by a separate staircase and made available for the use of the jury and of members of the Royal Commission.

"There would be a restaurant in the basement.

"It is proposed to empower the committee to appoint an architect and an hon. secretary, and to direct them to prepare a report, with plans and estimates, for the consideration of the executive committee.

"The committee should be authorised to engage the services of a French architect, who would be associated with his English colleague."

The committee, with the advice of Professor Aitchison, secured the services of Mr. E. L. Lutyens as architect.

The site of the pavilion presented unusual difficulties. A tunnel passed through the centre, the covering of which was not sufficiently strong to bear the weight of a building such as it was proposed to erect, and on the river side the newly-constructed quay was of too unstable a character for ordinary foundations. The great value of the loan collection, which it was intended to place in the pavilion, led the committee to decide that the building must be as nearly fireproof as possible, and Sir Benjamin Baker, K.C.M.G., who was consulted, kindly favoured them with his assistance by designing a steel structure resting on piles 30 feet in length on the quay side, and, spanning over the tunnel without touching it, on to the solid ground beyond.

The preparation of plans was at once commenced by the architect, and the co-operation of leading firms of decorators and furnishers of domestic appliances was sought. On January 24, 1899, the committee were able to submit their proposed plans to the Administration, whose assent was received on February 11, 1899, but the formalities were not completed, and the ground was not formally handed over to the British Commission till the month of May. The loss of three months,

due to the delays of the Administration, was of serious consequence, as it made it impossible to finish the building before the commencement of winter, and added materially to the expense.

At this time the pressure in the steel trade in England made it a matter of the utmost difficulty to secure the execution of orders, and as the construction of the pavilion presented many peculiarities and time did not admit of the preparation of detailed specifications, the committee determined to avail themselves of the services of Messrs. John Aird & Son, who had kindly signified their willingness to erect the building at cost price.

The work was pushed forward as rapidly as possible, Messrs. Aird keeping a permanent representative at the works of the Thames Ironworks Company, who supplied the steel framework, to insure the prompt despatch of the different portions as they were completed. Essential portions, however, were not delivered within the stipulated time, and mistakes in manufacture were made which necessitated alterations on the spot, so that the framework was not completed until January, 1900.

The decorators also were somewhat behindhand, the decorating trade was extremely busy at this period, and there was a not unnatural tendency on the part of exhibitors to set aside exhibition work in favour of other contracts. The Commission used their influence as far as they could, but they felt that undue pressure might lead to the withdrawal of exhibitors, whom it would be impossible to replace at so late a stage. The exterior of the building was completed by April 15, the interior soon afterwards, and the works of art were placed in position by May 19. The press were admitted on the 23rd and the official inauguration took place on the following day.

The pavilion, which stood on an arched terrace rising from the lower quay, represented a stone Jacobean country house of two storeys and an attic. The north or river side was an adaptation from the south façade of The Hall, Bradford-on-Avon, built at the beginning of the seventeenth century, the south side was adapted from another house of the same period, and the remaining sides were designed in the same style. The river face was broken by three deep bays surmounted by gables, and the south side also by three bays terminating in turrets. The principal entrance was in the centre of the south side, and was approached by a double winding staircase. Sculptured balustrades and heraldic animals ornamented the roof, from which rose stacks of twisted brick chimneys. The framework of the building was constructed of steel and weighed 310 tons, and the external walls were composed of plaster over expanded and corrugated sheet metal. The floors were of concrete, so that, with the exception of the panelling and staircases, practically no wood was used other than the battens necessary for attaching the internal ornamental work. The exterior was painted to represent weathered stone, and, although there was some difficulty at first in obtaining the proper colouring, the effect when completed was sufficiently realistic. Lead rain-water pipes with ornamented heads were fixed on each side of the building.

Externally the pavilion suffered in appearance from two causes. It happened to be situated between two others of much greater height, so that it was somewhat dwarfed, and it lost much by being divorced from its natural surroundings of park and terraced garden, but it had a quiet dignity of its own, and in spite of the unfortunate accident of its position, it compared favourably with its more florid neighbours.

The interior may be best described following the route taken by visitors. Entering by the south porch in the Rue des Nations, the entrance hall was reached. This apartment, 38 feet in length, with a projecting bay at the south-west angle, was paved with large squares of black and white marble. The walls were panelled in oak to a height of 4 feet, and above the wainscoting were hung four pieces of tapestry, designed by the late Sir E. Burne-Jones, which were most kindly lent to the committee by Mr. G. McCulloch, and were for the purpose removed from the walls of the room in his own house which they served to decorate. This tapestry was greatly admired by French artists. The spaces between the tapestries were filled with trophies of English arms and armour, lent by Mr. Seymour Lucas, R.A. The room was furnished with original oak tables of the period lent by Mr. W. Robinson, and a modern carved and inlaid chair lent by Mr. W. Strang Steel. Stained-glass windows, designed to match the tapestry, were lent by Messrs. Morris & Co.

Opening out of the hall was the library, which was completely decorated and furnished by manufacturers of the city of Bath, under the directions of Major Davis, F.S.A., city architect. From the hall visitors passed through a panelled corridor containing a collection of mezzotints (lent by Lord Cheylesmore) to the saloon. To the right of the saloon was the dining-room, and to the left the drawing-room. These three rooms were all panelled in oak and had decorated plaster ceilings. The walls of the drawing-room were hung with red silk damask above the oak dado, and the ceiling with its heavy

\* A report by Major-General Sir Arthur E. A. Ellis, K.C.V.O.

pendentives was a reproduction of one at Broughton Castle. The windows were partly filled with stained glass, and Messrs. John Broadwood & Sons exhibited in this room a grand piano-forte, the outer case of which was designed by Mr. Lutyens.

A door at the further end of the drawing-room led to the principal staircase, the floor of which was paved with Opus Alexandrinum. The staircase, with its screen in two tiers of triple arcades, was made of oak, and the windows were filled in with stained glass of heraldic design.

On the first floor the long gallery, 70 feet in length, was an adaptation of the cartoon gallery at Knole. From the long gallery an archway opened into the china closet, which contained a collection of old English porcelain, and passages gave access to a bathroom, two completely furnished bedrooms and a dressing-room. After passing through these, the visitors descended by the secondary staircase and quitted the building by the west door.

A door on the east side opened into a small lobby, which was used as a *poste restante* for British visitors. This lobby gave access to the stairs leading to the Commercial Information Offices on the upper floor and to the south-east room on the ground floor, which was fitted up as a writing-room for the use of the Royal Commission.

The principal rooms were fitted up and furnished by the following exhibitors:—Messrs. Arrowsmith & Co., entrance hall; Henry Bertram & Son, dining-room; George Jennings, lavatory; Collinson & Lock, saloon; Gillow & Co., drawing-rooms; John Thompson & Co, grand staircase; S. J. Waring & Sons, long gallery and china closet; Doulton & Co, Ltd., bathroom; Bromsgrove Guild of the Applied Arts, south-east bedroom; Johnson & Appleyards, Ltd., south bedroom and dressing-room.

The other exhibitors who contributed were:—Ames Lyde, Elsum & Co., casements, door furniture, lanterns; Anderson, Anderson & Anderson, indiarubber door mat; G. P. Bankart, ceiling in entrance hall and south-east bedroom; W. A. S. Benson & Co., electric light fittings; Burt & Potts, casements and glass of saloon and exit stairs; Chubb & Sons, all interior locks; Elkington & Co., electrotypes reproductions of the Knole silver sconces, chandeliers and mirror frames; Gooddy, Cripps & Sons, Ltd., marble pavement in entrance hall; J. & W. Guthrie and Andrew Wells, Ltd, windows in stained glass in dining-room; Henry Hope & Sons, Ltd., metal casements in south-east bedrooms; Arthur Lee & Bros., Ltd., marble tile pavement in staircase hall; Longden & Co., enamelled bronze fire-dogs in entrance hall; National Accident Prevention Window Company, casements in entrance hall; Needs & Co., exterior locks and safes; J. Pain & Sons, flags; Royal School of Art Needlework, embroidered hangings and furniture covers in south bedroom and dressing-room; W. Smith, casements and stained-glass windows on grand staircase; Starkie Gardner & Co., fire-dogs, hinges and door furniture, electrolier; Treloar & Sons, fibre door mat; Wall Paper Manufacturers, Ltd., Anaglypta ceiling of grand staircase; George Wragge, leaded and stained windows and casements in drawing-room.

Visitors were much impressed by the excellence of the materials and workmanship of the internal fittings, which were in striking contrast to the temporary character of the imitations which did duty in most of the other pavilions. The absence of ostentation, the sober richness of the oak woodwork, the appropriateness of the decorations, the sense of style, the air of comfort, and the palpable solidity of the whole structure were peculiarly English, and made a marked impression, especially upon the French visitors, who were loud in their praises.

It was the intention of the committee to use the pavilion for the display of the best procurable specimens of British furniture and works of art, and they deemed it expedient to confine the collection to pictures of the eighteenth century and early part of the nineteenth, partly in view of the limited space at their disposal, and partly on account of the exceptional interest which the British school of that period excites in France at the present time. The only exception which they made was in favour of the works of Sir E. Burne-Jones, five important examples of which were shown together in the saloon. The collection, of which a complete list is annexed, comprised forty-five pictures of Hogarth, Sir Joshua Reynolds, Gainsborough, Romney, Morland, Raeburn, Hoppner, Sir Thos. Lawrence, Opie, Constable, Bonington and Turner. This collection was obtained by loan. H.R.H. the Prince of Wales took a strong personal interest in the project, and addressed letters, signed by himself, to the owners of valuable pictures requesting them to lend their works for the period of the Exhibition. But for this action on the part of His Royal Highness it is doubtful whether it would have been possible to form so remarkable a collection in the circumstances which prevailed at the moment. The committee were very sensible of the generosity of those who consented to deprive themselves of their treasures for no less than seven months. They omitted no precaution to insure the safety of the pictures committed to their care. They adopted a system of construction which

they believed to be absolutely fireproof. They forbade any form of heating apparatus in the house, and the use of artificial light. They caused the pictures to be packed and transported in the safest manner, and they insured them for a large sum. These and other precautions which they thought it expedient to take were doubtless reassuring to the lenders; but the committee were none the less grateful to them, and desire to take this opportunity of recording their thanks for the assistance and co-operation of those through whose liberality they were enabled to make a display of British art which was admitted to be the most striking feature of the British section, and one of the most attractive in the whole Exhibition. Her late Majesty the Queen was graciously pleased to contribute two portraits of the highest importance to the collection, a circumstance which was keenly appreciated by French visitors, to whom the pavilion and its contents were little less than a revelation.

The collection, packing and transport of the collection were carried out under the supervision of Messrs. Thomas Agnew & Sons. The pictures were collected from their owners and received at Messrs. Hudson's repository at Wilton Road in a room exclusively reserved for the purpose. They were there packed in cases and placed in three box vans and despatched to Paris by passenger train via Folkestone and Boulogne, a foreman of Messrs. Hudson's travelling through the whole way without leaving them. The pictures arrived in Paris on May 1, and the hanging of them was completed, under the personal supervision of Sir William Agnew, to whom the committee are specially indebted, by May 19.

The cases were stored in the basement of the building to prevent the possibility of delay at the close of the Exhibition, and the pictures were finally despatched from Paris on November 12 in the same manner that they had been sent there. It is gratifying to be able to record that the loan collection was returned to its owners without a single item of damage. The whole collection was insured against all possible risks from the time the works left the possession of their owners until they were restored to their care. The premiums represented a considerable proportion of the expenditure in connection with the pavilion, as the sums insured amounted to no less than 241,080*l*.

With the consent of the Home Secretary, the Chief Commissioner of the Metropolitan Police placed an inspector and six constables at the disposal of the Royal Commission for duty in the royal pavilion. On May 19 the detachment under Inspector Hogbin, of B Division, arrived in Paris, took over the charge of the building and its contents, and maintained a continuous service night and day from that date until the works of art were despatched on their return journey on November 12. A flat was secured in the immediate neighbourhood of the Exhibition, where the police were lodged together. Several of the constables spoke French well, and their unfailing courtesy and patience in dealing with the large crowds who passed continuously through the pavilion evoked general admiration. The police wore their ordinary uniforms, and were a source of much interest to foreigners, while their familiar appearance seemed to give great satisfaction to English visitors. In addition to his other duties, Inspector Hogbin undertook the superintendence of the cleaning of the building.

Besides the English police, French guardians were employed for watching and cleaning. Although more were employed at the beginning, it was found later on that four guardians and a brigadier sufficed. A mason and carpenter were also engaged to execute necessary repairs and alterations and to act as guardians when not otherwise occupied. They all did their work in a most satisfactory way, and credit must be given to the brigadier, Monsieur Louis Lantheaume, a retired police officer, for the tactful manner in which he regulated the duties of his men and prevented friction between them and the other employés. In addition, the Corporation of the city of Bath kept an attendant in the library to explain their exhibits, and Messrs. Waring & Sons, Messrs. Johnson & Appleyards, and Messrs. John Broadwood & Sons had representatives more or less continuously in the pavilion.

The arrangements for the admission of the public were as follows:—The pavilion was open every day, except Wednesdays, from 10 to 12.30 A.M., to visitors provided with cards of admission, obtainable on application at the offices of the Royal Commission in the Avenue de la Bourdonnais. The fact of having to go outside the Exhibition was sufficient to deter the bulk of the public from applying for cards, and the number who thus visited the pavilion in the mornings did not, as a rule, exceed four hundred. Permanent tickets giving admittance in the morning were also issued. The restricted numbers and absence of crowding in the morning were much appreciated by those who desired to make a serious study of the loan collection and exhibits. In the afternoon the pavilion was open without restriction every day, except Wednesday and Sunday, from two till six. The public were admitted in batches of fifty, and it was found possible to admit as many as six thousand visitors a day without overcrowding. Although

there was usually a considerable queue of visitors outside the door, it was seldom necessary to keep them waiting more than three minutes. The total number of visitors during the continuance of the Exhibition was 608,976. After practical experience of the working of these arrangements, it is doubtful if they could have been improved upon. Although the pavilion was closed to the general public between 12.30 and 2 o'clock, the hon. secretary was in attendance to show special visitors over the building, and on Sunday afternoon the police inspector (and usually the hon. secretary) remained on duty for the same purpose.

The committee being debarred by the terms of their insurance, and the pledge given to the owners of works of art, from permitting any fires or heating apparatus within the building, it became impossible to use the basement for a restaurant, as was done in the other pavilions. A portion of the basement was utilised as a fire station, and Messrs. Merryweather & Sons installed there one of their latest pattern steam fire engines, which was kept ready for instant use, so that in case of any failure of pressure in the fire mains, the engine could be run out on the quay and draw its supply from the river. Fire hydrants with hose attached were placed on each floor of the pavilion, with hand pumps and buckets at numerous points. Appliances were also provided for adapting the English to the French hose junctions. All these appliances were under the charge of two English firemen, one of whom was on duty night and day. The whole staff were instructed in the use of the simpler apparatus. Messrs. Merryweather's engineers, Mr. Lock and afterwards Mr. Allen, were frequently in attendance, and were at all times ready to give any assistance that might be required.

Following the example of the International Fine Art Section, the pavilion was not lit at night, but electric lamps were placed in all rooms to obviate the necessity of the watchmen carrying lanterns at night, and also in the stairs and passages, as these required artificial lighting towards dusk during the closing months of the Exhibition. As the exterior architecture of the building did not lend itself to illumination by rows of lamps, as in the case of most of the other pavilions, Bengal flames were burnt on the terrace so as to light up the river front whenever general illuminations were ordered.

All the foreign pavilions were closed one day a week for cleaning and repairs, and as Wednesday was the day selected for the Royal Pavilion, the British Commissioner took the opportunity, with the approval of the committee, of giving receptions from time to time. The number of guests varied from three to seven hundred on each occasion mentioned in the following list:—

May 23.—Press view.

May 24.—Official inauguration.

June 13.—British Chamber of Commerce in Paris and members of the British colony resident in Paris.

June 27.—Members of the International Jury on Fine Art.

July 25.—The Welsh choir visiting Paris.

August 22.—A reception given by the President and Council of the Institution of Electrical Engineers to their American and Continental colleagues.

September 5.—Delegates of the Associated Chambers of Commerce of Great Britain.

September 19.—Iron and Steel Institute of Great Britain and members of the International Railway Congress.

October 3.—British exhibitors.

October 24.—Farewell reception.

The formation of a Commercial Information Office, under the direction of a joint committee of the Royal Commission and of the British Chamber of Commerce in Paris having been decided on, an order was received on April 25 to construct a set of offices for its use in the upper storey of the pavilion. This work was carried out by French contractors under the supervision of the hon. secretary of the Royal Pavilion committee, and was completed, including decoration and furnishing, by June 1. Rooms were also placed at the disposal of jurors for their consultations, a courtesy which was much appreciated, and similar accommodation was afforded to committees of the various congresses.

An extract from the British official catalogue, giving a list of exhibitors and of the loan collection, preceded by a brief description of the building, was prepared, and many thousands of these were distributed gratuitously to visitors.

All exhibits in the Royal Pavilion were eligible for awards in the same manner as those shown in other parts of this Exhibition, and the awards to the pavilion exhibitors were satisfactory on the whole. A grand prix was awarded to the architect, Mr. E. L. Lutyens.

The close of the Exhibition was postponed from November 5 to November 12, but owing to arrangements made with lenders it was not possible to keep the pavilion open after the date originally fixed, and the doors were finally closed on Sunday, November 4. The loan collections were despatched a few days later.

On November 13 the exhibitors began to remove their

exhibits, and on December 19 the hon. secretary was able to hand over the shell of the building to Messrs. John Aird & Son, who undertook to remove it and to make good the ground without expense to the committee, retaining the materials for their own use. They further undertook to refund such portion of the octroi dues already paid as could be recovered.

The task of the committee was long and arduous, and was not free from anxiety. They met many times in 1898, 1899, 1900, and their final meeting took place on March 23, 1901. In addition to the formal meetings there were frequently conferences between the members to deal with the numerous and varied difficulties which arose from time to time. They desire to place on record their obligation to Messrs. John Aird & Son for their kindness in undertaking the construction of the building at cost price, and to Sir Benjamin Baker, K.C.M.G., for supervising the design of the steel framework of the structure. To the Department of Science and Art they are indebted for the loan of the reproductions of silver furniture, fire-dogs and chandeliers at Windsor and Knole, as well as for the use of moulds for the ornamental ceilings. To Lord Sackville the thanks of the committee are due for his kindness in allowing the details of the cartoon gallery and staircase at Knole to be copied, and, lastly, to Mr. J. Moulton, the present owner of The Hall, Bradford-on-Avon, for permission to copy the façade of his house, and for the facilities which he afforded for the preparation of the necessary drawings and measurements.

The committee have no reason to be dissatisfied with the result of their labours. The British Pavilion enjoyed perhaps a larger measure of popularity than any of the others, and visitors showed their appreciation by returning again and again.

## ROYAL ARCHÆOLOGICAL INSTITUTE.

THE annual meeting of the Royal Archæological Institute was held last week in Nottingham. The mayor (Mr. F. R. Radford) welcomed the members. He said they would be able to visit Southwell, St. Mary's, Worksop, and Blyth. There were the caves in the Hermitage Grounds. The splendid Elizabethan pile of Wollaton, and Mary Stuart's prison-mansion at Hardwick would awaken memories of the Tudors. Newark and Wiverton would testify to the strife of the Stuart period. Within their own streets he thought that they would find some links with the past still remaining. Their walls and gates had long since disappeared, and even recently the rock dwellings at Sneinton had given way to new railway lines and new roads. But in their modern developments they tried to be not unmindful of old traditions. In the castle the municipality preserved the remains of the stronghold which had borne its part in history from the Danes, the Saxons and William the Conqueror, on through Plantagenet, Tudor and Stuart days, down to the troubled times of the great broadening of the constitution by the first Reform Act.

### Presidential Address.

Lord Hawkesbury, in delivering his presidential address, said it was a great pleasure to him to meet the members on that occasion, and to assure them that he felt highly flattered when the desire was expressed that he would preside over that meeting. Nottinghamshire was very rich in archæological treasures, and there was plenty of food for the historian. They had also the advantage, which some counties had not, of a very excellent county history. Thoroton's work was most excellent, but much remained to be done. For those who had come to Nottingham for the first time, perhaps he might be allowed to enumerate the monastic houses in the limits of the county. Altogether there were about thirty-nine, if the smaller ones were included, as well as the colleges and hospitals. Thirteen were houses of importance. There were no less than five houses of the Augustinian Order—Felley, Newstead, Shelford, Thurgarton and Worksop. There were two Benedictine houses (Blyth and Walling Wells), one Carthusian (Beauvale), one Cistercian (Rufford Abbey), one Cluniac (Lenton Priory), one Gilbertine (Mattersey), and two Premonstratensian (Brodholme and Welbeck). Felley was founded in 1156, and dedicated to the Virgin Mary. Newstead, all Nottinghamshire men would agree, was one of the greatest archæological treasures in the county, and he regretted that it had not been found possible to include it in the programme of their excursions. Newstead was founded by Henry II. in 1190. In those early days the monks were sometimes called of "Sherwood," afterwards "of Newstead," or *de novo loco*. In the second year of Henry VIII. Newstead was granted to Sir John Byron, whose descendants possessed it until 1818, when it was sold by Lord Byron, the poet, on his leaving England, to Mr. Wildman, and subsequently it came to the family of Mr. Webb, whose daughter was its present possessor. Shelford Priory, on the side of the Trent, was founded in the reign of Henry II., and at the Dissolution was granted to an ancestor of the first Earl of Chesterfield. On the death of the seventh earl it passed

to his sister, Lady Carnarvon, whose family still possessed it. Thurgarton, founded about 1130, they would see on the morrow. It was a very interesting remnant, though there was not much of it. The fifth and last of the Augustinian houses was that of Worksop, which was founded in the third year of Henry I. At the Dissolution it was granted in exchange to Francis, fifth Earl of Shrewsbury. Part of it still stood. It was restored about sixty years ago by Sir Gilbert Scott, being one of the earliest of the large churches that he restored. When they saw it they would agree that he (Lord Hawkesbury) might well be proud of his native parish church. This and Thurgarton were under consideration in 1858, when it was proposed to found a new see for this county. Passing to Lenton Priory his Lordship observed that it was founded by William Peveril in the reign of Henry I. It was richly endowed with lands given by people of this neighbourhood, and was dedicated to the Holy Trinity. Part of it was still to be seen in the church of Old Lenton. Of the Benedictine houses Blyth was founded in 1088 and Walling Wells in the time of Stephen. Beauvale, a Carthusian house, was founded in 1344, and Rufford Abbey, which belonged to the Cistercian Order, was founded by the Earl of Lincoln in 1148, for monks brought from Rievaulx. The Gilbertine Priory of Mattersey was founded in 1192. Welbeck was begun in 1153, and was finished in the reign of Henry II. At the Dissolution the site was granted to Richard Whalley of Screveton, and afterwards it came into the possession of Charles Cavendish, the younger son of the celebrated Bess of Hardwick, his son being the Duke of Newcastle, and it passed by marriage to the second Duke of Portland. With regard to Welbeck, the present Duke had told him that since the unfortunate fire which a few months ago destroyed that part of the house known as Lady Oxford's wing, they had come across some vaulting in the lower part of the wing, and he hoped that an expert friend of his might go over and see whether it was a portion of the old abbey. The smaller monastic houses of Bingham, Bradebusk, Clifton, Fiskerton, Marshe, Newark, were referred to, Nottingham (where there were eight), Rodington, Sibthorpe, Southwell, Stoke-by-Newark and Tuxford. The county was equally rich in churches. St. Mary's, Nottingham, was at one time thought of as the seat of the bishop, but finally Southwell was chosen. The county had sustained a great loss by fire in the early part of this year at Sturton. The tower, however, was preserved, although the beautiful old church was completely gutted, including the screen and monuments. The Domestic architecture of the county was equally rich. After mentioning that the stone for building Wollaton Hall was brought on pack-horses from the Ancaster quarries, the speaker concluded by hoping that during the week the weather would be propitious, and that no contretemps would occur to prevent their enjoyment of the beauties in the county of Nottingham.

Sir Henry Howorth proposed a vote of thanks to the Mayor and to Lord Hawkesbury, which was seconded by Mr. E. W. Brabrook.

#### *St. Mary's Church.*

The first visit was to St. Mary's Church, where, prior to an inspection of the building, a paper by Mr. W. Stevenson was read. The site on the top of a precipitous hill, he said, told its own tale of antiquity. Long before Edward the Confessor's time it was a wealthy foundation, endowed with land and houses. In the later days of William the Conqueror, when the rectory was in the holding of Aitard the priest, the church and all its belongings were recorded in the great book of Domesday as being worth 100s. In early times it ministered to the adjoining manors of the Castle and Sneinton, which, combined, formed the central wapentake of the county. With the Norman Conquest the lordship of the old English kings became the lordship of a Norman vassal—the mysterious William Peveril, who was seated with iron hand on the adjoining castle rock. He founded the alien priory of Lenton, and as part of the endowment gave this church, by consent of Henry I., with its lands, tithes and appurtenances. The current of its history was here turned, and for fully 400 years the church, with those in the adjoining manors, was in the dead hands of the prior and convent. This, the richest, they took to themselves, and reduced the rectory to a vicarage. The earliest recorded vicar was Johannes de Ely, in 1290, but it was a vicarage before 1234. The last of the long line of priors of Lenton, patrons and rectors of the church, was Nicholas Heth, who, with his brethren, was hanged on the gallows of Nottingham in 1538 for the part they played in the great revolt called "The Pilgrimage of Grace." Queen Elizabeth sold the patronage and rectorial property into lay hands, since which the tithes had been commuted into real estate. The churches which occupied the site down to the Norman Conquest were doubtless largely constructed of wood. The town was burnt in 1140, when it was recorded that the churches were burnt along with great numbers of people who had taken refuge therein. There were some deep caves in the rock under the church, partly accessible to-day. It was again burnt in 1153, and a third time in 1174.

There was evidence of an arcaded church in stone being built about 1175, and the rebuilding of a portion of it about a century later, the evidence of this being some late Norman capitals in the foundation of the church, and the remains of an Early English column in the base of one of the piers of the north arcade. These early churches were further represented in the top course of the foundations of the present nave and transept walls. The date of the erection of the present church was somewhat uncertain, there being no documentary evidence. During the continuance of the plague called "The Black Death," six vicars were appointed in five years—from 1347 to 1351. John Leland, the antiquary, was in the church in 1540, and described it as "excellent, new and uniform in work." He (Mr. Stevenson) inclined to the opinion that the date of the erection was about 1380. The church, with the exception of the restored portions, was built of local stone, which, as a building stone, was not quarried in the county at the present time. A controversy had long existed with regard to the chancel, the details of which, though evidently by the same architect, were very poor. Some advanced the opinion that it was later than the west part of the church. He submitted they overlooked the fact that the body of the church would be erected by the munificence of the county gentry and the princely merchants of the town; whereas the erection of the chancel would be dependent upon the patron and rector, the prior of Lenton. He did not think he was far wrong in laying the poverty of the chancel at the door of the prior of Lenton. There was no sedilia, piscina, aumbrey, credence or Easter sepulchre in the church. Inserted in the south wall of the chancel was a fragment of sculpture in alabaster. The subject was a Pope consecrating a bishop. It was found beneath the floor of the church some years ago, and was, no doubt, a portion of the original reredos. Nottingham was an important centre for sculptors in alabaster, and a large business was done all over the country in heads of John the Baptist. Little could be said of the contents of the church. The iconoclasts of the last century destroyed the tombs, spared by the fanatics of the Civil War, of which Nottingham was an important centre, and the church has passed through the fire of a number of "restorations," each in its turn being deemed an improvement. The Mediaeval tombs pictured by our early historians were witnesses of improvement. To them it had largely meant improving off the scene. The first and second earls of Clare, who figured on the side of the king in the Civil War, were buried in the east side of the south transept, but their great tomb, with its storeyed urn and its four mournful obelisks, was gone. The inscribed panels now constituted tablets on the immediate east wall. The west end of the church was entirely rebuilt in 1725 in the Classic style, almost as severe as Newgate Prison, London. The arcades gave evidence that the old front was leaning or falling westward. This endured to his time, and was taken down in the middle of the last century. The present west end, as a restoration of the original one, dated from that period.

#### *St. Peter's Church.*

At St. Peter's Church Mr. Robert Evans acted as cicerone. He said it was to be regretted that there were so few records existing relating to this interesting church, one of the three churches of the three parishes of Nottingham. It was evident from what could now be seen that a much older building had existed on this site. He referred chiefly to the southern arcade, which various authorities spoke of as late twelfth-century work. The early English church of that period had the outline of the roof clearly defined on the eastern face of the tower wall, and there were other evidences in the wall over the arcade referred to. He asked them to note the second pier from the west, which was a massive piece of masonry. From this point the remains of a screen were found during the recent renewals of the floor, probably forming a parclose, and the remains were stumps of the main posts carrying the screen. The remaining piers of the south arcade were of characteristic detail and good proportions. Turning to the northern arcade, several changes had been made. The early English work had all but disappeared, the arches having been raised and some late fourteenth-century work substituted. This again had been mutilated by the erection of a gallery extending over the whole of the north aisle and across the west end of the nave, which galleries were removed in 1884. The clerestory windows were of a debased character, the former ones being traceried and of Perpendicular work. The nave roof was a fine example of the period. It was said that the Strelley family, an old Derbyshire and Notts family, were chiefly concerned in bearing the cost of this work during the Archbishopric of Kempe. Sir Robert Strelley married Isabella, a daughter of the house of Kempe, who died in March, 1488. The roof of the south aisle was of similar detail. Perhaps one of the most interesting discoveries recently made had been the staircase to the rood-screen. When some rather loose masonry had been removed some of the lower and some of the upper steps were found intact, the intermediate steps having been

supplied as now seen. To the left, on the top landing, was a large slab on end, having five incised crosses like unto ancient altars, and probably this was part of one of the old chapels of All Saints or St. Mary's. In the tower there was a fine, well-constructed groined ceiling. Over the opening in the centre was a covering, on which was depicted the emblem of St. Peter, viz. the cross keys and head of a pastoral staff. A few remains of mural decorations, chiefly lettering, were to be seen, chiefly on the wall at the east end of the south aisle. Deering recorded that, about 1739, a vault was being formed at the east end of the north aisle for the Smith family, when a stone coffin was found, as also an encaustic tile bearing the symbols of St. Peter and St. Paul. The bones found in this excavation were believed to be those of John de Plumtree, founder of the hospital bearing that name. The present chancel was, as would be seen, a modern restoration, the chancel of the old church having been destroyed during the Civil Wars at the time when Colonel Hutchinson was governor of Nottingham Castle. Another chancel was built soon after, the north and south walls projecting inwards and partly covering the piers of the great arch, and the ceiling coming nearly as low down as the pier caps. When the building was removed the foundations of the original chancel were discovered and the present walls erected thereon. The Spiritual Court of the Archdeaconry was held up to a recent period at the western end of the south aisle. This court was formerly held in the chapel of All Saints, on the site of the present vestry. Of the tablets or monuments there was but little to be said. Amongst them would be found one to William Cressey, a judge of the King's Bench, Ireland, who died in 1645; one to William Ayscough, 1719, of whom Deering wrote that he first introduced printing into Nottingham in 1710, though some doubt attached to the statement. There was a marble monument in the south aisle to Alderman Trigge, a benefactor to the poor of the parish. The oldest monuments were those to the Lockes and Saunders, 1636. In the restoration of the floor of the church a few years ago, many incised slabs were found covering vaults and graves. A careful plan of these was made and a copy for reference now hangs in the vestry. The dates on the old bells were 1672, 1666, 1635, 1685, with appropriate inscriptions, such as "God save the King" and "God save His Church." These bells had been recast since 1780. The sacramental plate was not very ancient, but quite worthy of inspection. This reminded him that, about twenty-three years ago, his late friend, George Freeth, informed him that he had seen a document by which "in May 7 Edward VI., John Colinson, then mayor, Sir G. Clifton and other King's Commissioners, delivered to Nicholas Cooke, parson of the parish church of St. Peter's, Nottingham, and Thomas Goldrynge and Richard Burton, churchwarden, two chalices, one gilt the other parcelgylte, with two pattens for the same, for the administration of the Holy Communion, and also five bells of one accord, and a saints' bell all hanging in the steeple of the same church, with a clock in the same, to be safely kept, employed, unembesilled and unsold until the King's Majesties pleasure." Their registers were interesting and worth inspecting. In the year 1572 and four succeeding years there were on an average eighteen baptisms and fourteen burials per annum, the population of the town then being about 2,400. Two hundred years later it was 30,000. There were some interesting records of the Guild of St. Mary and St. George, dated about 1440. They were chiefly accounts of the guild, and could be seen in the vestry. In a contribution of Mr. W. H. Stevenson to the *Nottingham Guardian* in April 1880 an interesting translation had been given relating to an enforcement of the rectory and appurtenances in the time of William of Ruddington, rector of St. Peter's, but it was too long to quote on that occasion. The charities connected with the church for the benefit of the poor were bequeathed by Robert Sherwin, 1638; Anthony Ackham, 1638; William Skeffington, 1634; Manners, Jackson Boycroft, Robinson, Wyer, Rowan, Sanderson and others of the present value of nearly 240*l.* per annum.

#### *The Castle.*

The next place visited was the Castle, where Mr. E. Green read a paper recalling the salient features of interest in connection with Nottingham's ancient fortress, from the earliest times of the Danish invasions down to the date of its being dismantled during the period of the Commonwealth. Up to the time of William the Conqueror, Mr. Green pointed out, the Castle consisted merely of moated ground. There was no mention of a castle in Domesday. The first absolute date which he could find was 1131, when two shillings were spent on the chapel. Mr. Green dealt extensively with the part which the Castle played in the Civil War, and mentioned the different accounts given of the raising of his standard by Charles I. In 1651 the Parliament commenced destroying all castles, and that year an order was received by the mayor ordering the Castle to be destroyed by November 16, which was accordingly done.

The members inspected the various objects of archaeological interest, including the lodge and Mortimer's Hole. Sketches of the Mediæval building were furnished to each member of the party.

At the evening meeting a paper was read by Mr. A. F. Leach, F.S.A., on "The Ancient Schools of Nottinghamshire," and a paper on "The Church Bells of Nottinghamshire," by the Rev. Canon Raven, D.D., F.S.A., was taken as read.

#### *Southwell and Thurgarton.*

On the second day a party, under the presidency of Sir Henry Howorth, made a journey to Southwell. The ruined Manor House, known as the Episcopal Palace, was visited. The Rev. R. E. Smith, minor canon of Southwell Cathedral, acted as guide. Proceeding up the grand staircase of the partially restored ruin, the members assembled in the banqueting-hall. Canon Smith pointed out that there was little or nothing in the way of ancient records to guide the student of antiquities in the compilation of the history of the place, and the only aids to conjecture as to its original form of architecture lay in such fragments as remained of this fine Domestic building. As to the date of erection, the time could be placed with certainty in the fifteenth century, the work having been undertaken by succeeding archbishops of York of that period, a fact which was commemorated in the partial restoration of the building by the large window at the western end of the hall in which they were assembled, wherein were emblazoned the arms respectively of Archbishops Jno. Kempe, Geo. Nevile, Wolsey and Thos. de Corleridge. The restoration of the ruin, so far as it had been carried out, had been done through the private munificence of the late Dr. Trollope, Bishop-Suffragan of Nottingham, who also bought the plot of land adjoining and presented the whole to the see of Southwell. Dr. Trollope had also presented the portraits which adorned the walls and the window he had referred to, which was generally admitted to be one of the finest specimens of heraldic glass extant. The roof of the hall, prior to restoration, was almost the same as now, very little of it requiring renewal, but across the hall a wall of later addition had had to be removed to bring back the original form of the chamber. The portion of the hall on the western side of this partition had been used for various purposes—at one time as a court for the local justices, and at another time as a school—whilst the other end was part of a private house, there being a large stack of chimneys in the centre, which had to be removed during the work of restoration. The supposition that the archbishops of York were at one time in settled residence at Southwell was proved by the fact that no less than four of them had died there between the tenth century and the reign of Queen Elizabeth. The Chapter of Southwell was safeguarded in the enjoyment of various privileges by Papal bull from all outside interference, even by the archbishops. Indeed, the chapter was one of the most independent in the country, discharging duties of civil as well as ecclesiastical jurisdiction, and even down to fairly recent times the magistrates of the locality were nominated by the Archbishop of York instead of by the Lord-Lieutenant of the county.

#### *Southwell Cathedral.*

The party next proceeded to the cathedral. The exterior was examined, under the guidance of the Rev. G. M. Livett.

Commencing at the west front, Mr. Livett observed that there might be differences of opinion as to the effect of the restoration of the spires on the western towers from an æsthetic point of view, but the restorers were in all probability correct in the opinion that the towers had been thus brought back to their original form, and the slight cant in the spires was on the authority of a sepia drawing of the edifice by Turner, a copy of which he handed round for inspection. They would notice that the towers grew more ornate towards the top, the idea being to attract the eye upwards in order that the horizontal lines of the structure might not hold down the line of vision too much. The two windows, in Norman style, in the lower stage of the towers ought not to be there, and the innovation was made without authority. Where these windows were now placed there were two very beautiful Decorated windows of the fourteenth century. Of these the one in the north tower was removed in the early part of the past century, when it was thought necessary to strengthen the tower, and the other was taken away about forty or fifty years ago, the pair being replaced by copies of the other Norman windows at the side. Prior to the replacement of the spires there had been pinnacles of a type copied from the central tower, though how long they had been there it was almost impossible to say, the pinnacles existing at the time of the restoration under the direction of Mr. Christian having replaced others of identical pattern destroyed by fire in 1711. It was probable that similar pinnacles had flanked the gables of the transepts. An interesting point about the general design of this fine Norman building was its austerity; indeed, it was almost Rhine-like with its long lines and rude cable mouldings, but the large Decorated central window should be taken away, mentally, to gain an

idea of the original appearance of the west front. He would draw particular attention to the circular clerestory windows, which were very rare in England.

Canon Smith explained, in regard to the "little stone beasts" which formerly adorned the apices of the gables of the transepts that they had been recovered, respectively, from Lord Aveland's park, near Stamford, and the other from a garden at East Bridgford. One of these was replaced upon the gable of the south transept, but the other was discovered after a modern carving had been put in position, and was now to be seen in the triforium of the transept.

Sir Henry Howorth commented upon the tendency of architects to alter the form of buildings which they restored, with the result that all sorts of falsities and incongruities were perpetrated, and he did not think that this point could receive more appropriate illustration than in the west front of Southwell Cathedral, with its added central window. As President of the Institute he wished to say that archaeologists did not complain of the taste or good intentions of restorers, but they asked that during restoration ancient buildings should not be altered, but simply repaired, in order that they might be preserved in their beautiful entirety to posterity.

Mr. Livett next conducted the party to the chapter-house, a hexagonal building. Proceeding to the east end of the choir Mr. Livett drew attention to the change which had been made in the level of the clerestory string, as shown by traces on the eastern side of the central tower. After pointing out the unique feature in the lower flight of the eastern windows of four windows of the same height, Mr. Livett passed on to the east side of the south transept, where the traces upon the external wall of the former existence of an apsidal chapel were examined. At the western end of the south side of the nave it was pointed out that another chapel, formerly used as a grammar school, had been removed in the process of restoration. In reply to a question Mr. Livett said it was believed that the nebulous moulding in the parapet of the clerestory was original Norman, though it was a most unusual form.

The cathedral was then entered, and while the party enjoyed a brief rest in the nave, Mr. Livett gave an outline of the characteristics of the interior. He said it could be claimed for Southwell Cathedral that it was a very good example of Middle Norman architecture. A curious feature in the design of the interior was that there seemed to be nothing to take the eye upward except the four magnificent arches which supported the lantern tower. As to the period of the erection of the original church, it was a commonly accepted tradition that it was founded by Paulinus, the active missionary of Augustine, who was known, upon the authority of the Venerable Bede, to have baptized converts in the river Trent at no great distance from Southwell. This tradition had received considerable corroboration in the discovery by Mr. William Stevenson, jun., of documentary proof that the shrine of the Saxon St. Eadburh was at Southwell. The foundation of the church was due to the fact that in the early period he had referred to arms were put out by the mother churches to carry on the work, which was increasing beyond their capacity. As to the constitution of the chapter, he might say that there were originally sixteen prebendaries of Southwell, who were canons *ipso facto*, and there would also be about ten priests to perform duties in the chantries. A curious feature in the constitution of the chapter was that there was no dean, the canon who was in his turn residentiary usually presiding during the period of his residence. Until the old diocese of York was subdivided Southwell Minster retained its cathedral status, a position which was restored to it upon the erection of the see of Southwell, when it again became the mother church of a diocese.

The north transept was next inspected, and Mr. J. T. Micklethwaite gave an account of the tomb, with recumbent effigy in alabaster, of Archbishop Sandys, of York, one of the strictest of the Puritan faction of bishops, who died in 1588. In answer to a question as to the original dimensions of the choir, Mr. Micklethwaite said it was probable that the choir had once extended two bays further west, which would bring it westward of the transepts. Mr. Peers described the origin of the Anglo-Saxon fragments to be seen in the north-western corner of the north transept. Mr. Livett then described the choir, drawing attention to the beauty of the rood-screen—a charming example of the Decorated period—and to the fine groining on the western side. The grace of the eastern side of the screen, of which the carving was beautifully restored early in the past century by an Italian artist, was also pointed out, several members concurring in the opinion that the architect responsible for the restoration of the cathedral might have committed an error of judgment in removing the prebendal stalls, which flanked the choir and corresponded in design to the six still remaining. The combination in the choir of the triforium with the clerestory was much admired, but Mr. Micklethwaite commented upon the bad arrangement of the gas-fittings, which are disfiguring the stonework and probably decaying the masonry. The brass eagle lectern, of Flemish work, which was recovered from

a Nottingham pawnshop after being discovered, with its bowl full of documents, in a pond at Newstead, was inspected with great interest, as also were the sedilia to the right of the altar. After this an adjournment was made to the chapter-house. Mr. Livett named 1294 as the date of its erection, and enlarged upon its claims to be regarded as an almost faultless example of the Decorated period, the foliated carving of the capitals being probably unsurpassed, an observation which applied equally to the corresponding carving in the passage which gave access to the chapter-house. This concluded the inspection of the cathedral, and, on behalf of the members of the Institute Sir Henry Howorth thanked Mr. Livett for the ability and geniality with which he had acted as cicerone.

#### Thurgarton.

At Thurgarton the priory church was inspected under the guidance of the Rev. J. Standish. An Augustinian priory was founded by Thurston, Archbishop of York, and in later times it was enriched by additional endowments, Ralph d'Aincourt founding a chantry there in 1431. In 1537, at the time of the Dissolution, a prior and ten canons resigned to the king, the annual income being at that time of the value of 258*l*. The original priory church must have been a singularly fine structure, cruciform in design, and with a nave of seven bays, but of this edifice only the western half of the nave of the north-west tower, of thirteenth-century work, remained, the church having been restored in its present form by Gilbert Scott in 1854. Mr. W. H. St. John Hope also addressed a few remarks to those present upon the constitution of the priory. The crypt, which is the only remaining fragment of the priory, was also inspected.

#### The Calverton Carvings.

At the evening meeting the Rev. A. D. Hill read a paper on "Some Ancient Carvings at Calverton, Nottinghamshire." He said St. Wilfred's Church at Calverton appeared to have been rebuilt in the thirteenth century out of old material, and consisted of a chancel, a nave of the somewhat unusual form of a wide parallelogram, 42 feet 8 inches long and 37 feet 2 inches wide, of one span, and with no traces of any arcades, and a western tower, forming the only entrance to the church. Of the reused stones, the most interesting were to be found high up in the third stage of the tower, embedded as a horizontal course in the inner face of the west wall and bearing representations of the various occupations of the months of the year. Despised by the rebuilders, one at least of the masons at work upon the church felt a tender regard for the old carved stones, for he had built into his work, where few would see and none injure them, eight of the pictured representations which, perhaps, had served to instruct his dull wit and inspire his strong right hand in the old church of his boyhood. Seven of these stones were voussoir shaped, and must have formed part of a band of ornament 9 inches wide on the architrave of an arch with a radius of about 5 feet to their outer edge. The eighth stone had parallel sides, and might have formed part of a vertical continuation of the same band down the jambs of the arch. A ninth stone, also rectangular, was to be seen near the ground in the outer north side of the tower. Each panel had its own border, and a semicircular arch of the above dimensions would give room for the twelve months, with interspaces which might have borne the signs of the zodiac. No. 1 stone (January) was represented by a man seated at a trestle table, which groaned beneath the good cheer of a boar's head and a goose on flat, round dishes, a loaf and a flagon curiously inadequate to replenish the enormous drinking horn which the feaster held in his right hand. His left arm rested on the table and held a knife; his hawk, which the speaker took to be an indication of rank, stood on the edge of the table. No. 2 (February) dull and raw, was humorously illustrated by a man in a hooded cloak and sleeved tunic, seated on a low chair with scroll back and arms, and stretching out his left hand and heavily booted feet to the warmth of a crackling fire kindled out of doors beneath a tree, evidently an evergreen. His favourite bird was also enjoying the blaze, regardless of the danger to his feathers. On No. 3 was a man engaged in pruning a tree or vine with a large knife. At Brookland this subject was allotted to March, and at Burnham to April. No. 4 was a man holding in both hands an implement which might be a hoe, or a crook stick, which he seemed to be using among growing crops. At first this was supposed to represent ploughing, but on clearing away some mortar the upright portion appeared to represent a plant. In No. 5 August was represented by a man stripped to the waist reaping corn with a sickle. A neatly banded sheath stood upright behind him. Nos. 6 and 7 seemed to belong to a single month—September—and represented two men threshing corn with flails. No. 8 was a larger rectangular stone 9 inches by 13 inches, which did not fit into the series of months, and which he suggested might have belonged to the vertical band on the jamb. It was divided into two panels by a horizontal line. The upper compartments showed a knight on horseback, holding the reins in one hand

and stretching out the other with his hawk on it. The lower compartment represented a dog, the body like a greyhound, with a long tufted tail and a large head. It had a hare or rabbit in its mouth. No. 9, being in the outer face of the wall, was so much weather-worn that its subject was nearly indistinguishable. It was about 9 inches by 10 inches, and probably belonged, like the last, to the jamb. Two figures, facing each other with outstretched arms, appeared to be raising something between them, which might, however, be a third figure at a higher level. It might represent the Ascension of the Lord, though it hardly seemed to him (the speaker) to be intended for a religious subject.

#### Alabaster Work.

Mr. W. H. St. John Hope then read a paper on "The Early Working of Alabaster in England." He said that in the *Archæological Journal* for 1853 was a paper by Mr. E. Richardson on this subject, which included practically all that was then known about alabaster. Meantime other evidence had come to hand which throws further light on the industry. Since part of this evidence showed that Nottingham was for a considerable time an important centre for the alabaster trade, the present seemed a fitting occasion for laying the new evidence before them. In the Mediæval period the Nottingham "alabaster men," as well as those of York and Lincoln, of whom they also had evidence, wrought for the most part imagery and tables for reredoses and the like. Nottingham was already famous for reredos work in the reign of Edward III., but he could produce further documentary evidence of quite a century later. For certainly fifty years the image-makers and alabaster men of Nottingham were busily engaged upon images and tables, among which "St. John's Heads" were specially prominent, and these were sent away for sale in large numbers and hawked about the country. He laid some stress on the "St. John's Heads," because the evidence was so cumulative that the examples that remained had come from a common centre, which he claimed was Nottingham. There was evidence of the removal of the trade to Burton and other centres, and with the introduction of coarser stuff, monuments of new forms came into fashion.

Votes of thanks were passed to the authors of the papers, which we have derived from the excellent reports in the *Nottingham Guardian*.

(To be concluded.)

#### LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.

THE annual general meeting of the London and Middlesex Archæological Society was held at the London Institution, Finsbury Circus, on Friday. Mr. E. W. Brabrook, treasurer, presided and moved the adoption of the Council's forty-sixth annual report, which showed that, as at the last annual meeting, the members numbered 161. During the year the meetings had been very successful. The Council appealed for an increase of membership, pointing out that there was a noticeable revival of archæological interest among all classes of society in London. The motion was adopted. Dr. Freshfield was re-elected president, and Mr. Charles Welch, replying to a vote of thanks, called attention to the work done by the Society, which by fostering the love of antiquities among all classes of the people indirectly contributed largely to the preservation of objects of interest.

#### NATIONAL PORTRAIT GALLERY.

THE following portraits have been acquired by the Trustees of the National Portrait Gallery during the past few months:—

##### By Donation.

The Right Hon. Sir George Grey, P.C., K.C.B., 1812-98, the eminent colonial statesman; a posthumous portrait, painted by Hubert von Herkomer, R.A., and presented by the Sir George Grey Memorial Committee through the Hon. William P. Reeves, Agent-General for New Zealand. In this case the usual rule as to the expiration of ten years from the date of decease was suspended in recognition of Sir George Grey's great services to the Empire.

Her late Majesty Queen Victoria, an original sketch by Sir David Wilkie, R.A.; presented by the Lord Ronald Sutherland Gower, a Trustee of the Gallery.

George Granville Leveson-Gower, first Duke of Sutherland, K.G., 1758-1833, amateur and patron of art, and, as Earl Gower, noted as being the last Ambassador from the Court of St. James's to the French Court under Louis XVI.; painted by Thomas Phillips, R.A., and presented by the Rev. S. A. Thompson-Yates.

Geoffrey Plantagenet, Count of Brittany, 1158-61, son of Henry II. and heir to the throne of England; a reproduction from an ancient enamel portrait in the Museum at Le Mans, in France; presented by MM. Goupil et Cie.

##### By Purchase.

Benjamin Disraeli, Earl of Beaconsfield, K.G., 1804-81; a miniature portrait, painted in 1829 by Kenneth Macleay, R.S.A.

Sir James Dyer, 1512-82, Speaker of the House of Commons and Chief Justice of the Common Pleas; an old panel portrait, artist uncertain.

George Heming Mason, A.R.A., 1818-72, the well-known painter; painted by Valentine C. Prinsep, R.A.

Cuthbert, Lord Collingwood, 1750-1810, the eminent naval commander; a marble bust, artist uncertain.

George Cruikshank, 1792-1878, artist and caricaturist; a plaster cast from a bust by W. Behnes, R.A.

Edward VI.; a curious portrait in perspective on panel, which was formerly in the collection of Charles I.

A portrait of Sir Anthony Vandyke, by himself, and a small portrait of Prince Charles Edward Stuart have been deposited on loan in the National Portrait Gallery by the Trustees and Director of the National Gallery.

#### SIR T. DREW AND THE NATIONAL MEMORIAL.

IN a letter to the *Irish Times*, Sir Thomas Drew, P.R.H.A., writes:—

The *Irish Times*, at an early stage, showed an interest in the competition by architects for a scheme for the Queen Victoria Memorial in London, and greatly encouraged an Irish one to do his best in a representative character.

The announcement in the London Press given in the *Irish Times* might give the impression that the whole question of the competition is closed. I do not think that the official communication by Lord Esher to myself, of which I enclose a copy, may be so read.

The scheme formulated by the committee, for which designs were invited, consisted of "two main features, namely (1) the monument opposite Buckingham Palace, and (2) the arch or gate next Spring Gardens, to be connected by means of an architectural rearrangement of the Mall, with groups of sculpture at intervals, the whole forming a processional road, &c."

No. 2, practically a separate design, and concerned with Charing Cross more than Buckingham Palace, half a mile distant, was the project involving most skill and inventiveness on the part of the competing architects. Sufficient funds have not yet been subscribed, and Lord Esher's communication states that its consideration is postponed—neither adjudicated on nor abandoned. A statement in the Press that the thoroughfare from Trafalgar Square through Spring Gardens to the Mall must be opened before the Coronation, would suggest that the ultimate design of this project cannot long be deferred for consideration, and it is still an open one.

The money as yet subscribed towards the whole scheme, some £30,000, is no more than to justify the order for the monument already commissioned from Mr. Brock. It is no surprise, and no more than was anticipated, that the very able architect, Mr. Aston Webb, should be selected to advise as to so much as an architect is wanted for at present. It is thus stated in the instructions to competitors:—

"The central group, or groups, are to be the work of a sculptor nominated by the committee, and will have to be arranged in collaboration with him; therefore, any design suggested for these must be considered as only tentative."

The four competitors with Mr. Aston Webb would probably agree that for the special service immediately required the committee have made the most convenient selection in Mr. Aston Webb to collaborate with Mr. Brock, and shape definitely a merely tentative arrangement of roads and approaches round the Palace. It is understood that he of all the five architects is most conversant, from his connection with the official mind of public departments which would be concerned in improvements of Buckingham Palace and its avenues.

It will be observed that the course of placing first in order of merit any one of the competitive designs for the entire project conceived is carefully avoided, and under the circumstances, prudently and reasonably so. That is but postponed for further consideration or public opinion.

(COPY.)

H.M. Office of Works, Westminster, S.W.: July 25, 1901.

My dear Sir,—The committee have selected Mr. Aston Webb's ground plan for the front of Buckingham Palace, and have determined to postpone the consideration of the remainder of the Mall scheme until the amount of the subscriptions to the Memorial Fund has been ascertained.

I must thank you, however, most sincerely for your very fine drawings and plans.—I remain, yours sincerely,

ESHER.

Sir Thomas Drew, P.R.H.A.

## HAMPSTEAD ROAD IMPROVEMENT.

**A**T the weekly meeting of the London County Council on Tuesday the following recommendations of the improvements committee were adopted:—“(1) That, subject to a contribution by the Council of the metropolitan borough of St. Pancras of one-eighth of the net cost of the improvement, application be made to Parliament in the session of 1902 for powers to widen Hampstead Road between Euston Road and Tolmers Square, as shown upon the plan presented to the improvements committee on May 1, 1901; (2) that a clause be inserted in the Bill to provide that the carrying out of the improvement by the Council shall be proceeded with immediately on the Council of the metropolitan borough of St. Pancras giving its statutory consent to the construction of a tramway from the present terminus in Hampstead Road across Euston Road and along Tottenham Court Road to a point near Oxford Street; (3) that exemption from the operation of the 92nd section of the Lands Clauses Consolidation Act, 1845, be sought to enable the Council to acquire, if necessary, only portions of the properties Nos. 26 and 42 Hampstead Road, instead of the Council being required to purchase the whole of the properties in question; (4) that provision be made in the Bill for part of the cost of the improvement to be recovered by means of an improvement charge; (5) that, in connection with the foregoing improvement, the usual practice be adopted of inserting in the Bill a clause to provide that improvements made in lands or premises after July 23, 1901, when the scheme was made public, shall not be taken into account in assessing compensation, if such improvements be made with a view to obtaining compensation or increasing that payable by the Council.”

The net cost of the improvement is estimated at 225,500*l*.

## GENERAL.

**The King** has been pleased to become patron of the Society of Art Masters. When Prince of Wales he honoured the Society by accepting the post of honorary president.

**Lord Kelvin** has presented a beautiful loving cup of antique design to the Clothworkers' Company at the close of his year of office as Master.

**Professor Constantin Cretius**, the German painter and member of the Academy of Arts, died at Berlin on Friday last at the age of eighty-seven.

**Messrs. Greenhalgh & Brockbank**, of Southend, have been appointed architects for the additions to the poor law buildings of the Romford Union.

**The Wallace Collection** will be open on Bank-Holiday, August 5, at 10 o'clock, instead of as usual on Mondays at 12.

**Mr. E. Roscoe Mullins** has been lately commissioned by the Thahore Saheb of Morvi, whose equestrian statue he has now on hand, to execute a statue for him of Queen Victoria. Mr. Mullins has also been commissioned to execute a statue of Her late Majesty for the municipality of Port Elizabeth.

**Mr. Onslow Ford, R.A.**, has presented to the trustees of the Alexandra Palace a cast of his statue of Her late Majesty.

**The Platform** at Winchester for the reception of the bronze figure of Alfred the Great, by Mr. Thornycroft, R.A., is now resting on solid foundations, Mr. Driscoll, of Chiswick, and his men having dug down 23 feet till firm gravel or “ballast” was reached. This done, and the water exhausted by a powerful pump, the concrete has been poured in, and three of the four angles are secured against all sinking, while the fourth angle will shortly be also made fast.

**Mr. Arthur John Evans**, keeper of the Ashmolean Museum, Oxford, whose discovery of the Palace of Knossos has excited universal interest, has received the degree of LL.D. of the University of Edinburgh.

**Mr. Sidney Cooper, R.A.**, had the honour on Tuesday of being presented to the King, as the oldest member of the Royal Academy of Arts, and received from His Majesty the Royal Victorian Order of the Third Class.

**Mr. R. Comber Miller**, mayor of Chichester, has written a poem entitled “David the Broiderer,” which is to be sold for the benefit of the fund for the National Memorial to Queen Victoria.

**The Commons and Footpaths Preservation Society** reported at their last meeting that the Society had received a number of objections to the enclosure of Stonehenge and to the proposed diversion of the right of way running through the remains. Letters from Professor W. M. Flinders Petrie and others were read, urging that steps should be taken to secure the protection of free public access to the stones, and opposing any alteration of the existing roadway. It was resolved to approach the local authorities on the subject, and to make full inquiries as to the effect of the enclosure and proposed alteration.

**The Portsmouth Town Council** have decided to apply for powers to purchase the local waterworks at a cost of a million and a quarter. It is proposed to raise the necessary funds by means of corporation stock, extinguishable by the payment of 42,000*l*. a year for eighty years. The drainage and sanitary committee rejected on Tuesday the borough engineer's scheme for dealing with the drainage of Southsea and coping with the back-flooding nuisance. The scheme would have cost about 130,000*l*., and as an alternative Mr. Murch was instructed to further report upon the scheme he prepared in the early part of last year.

**Mr. A. E. Gough** has been appointed architect of the Lincoln Bracebridge lunatic asylum, which is to be erected at Canwick at a cost of 75,000*l*. Mr. Gough has been authorised to engage a surveyor to arrange the purchase of 60 acres of freehold land, and to proceed with the preparation of the specifications and obtaining bills of quantities for the several works comprised in the approved plans.

**On Saturday** the whole of the south side, from the roof to the ground, of a new Wesleyan chapel that is being built in Fore Street, Totnes, collapsed. Fortunately the workmen had not arrived, and no one was hurt. The chapel was being built at a cost of over 2,000*l*. A recent storm is supposed to be the cause of the collapse.

**The Office of Works** do not propose to erect the stand over the communion table of Westminster Abbey for the forthcoming coronation, as was at first feared.

**The Arbitrators** appointed to consider the amount of compensation to be awarded for the collapse of the passerelle at the Paris Exhibition have decided that the Exhibition authorities are liable. Sums from 40*l*. to 400*l*., in addition to some small annuities of from 8*l*. to 20*l*., are allowed.

**The Ground** occupied by the Paris fortifications is to be levelled and a boulevard constructed at an expense of two million francs. It is believed the Government being unable to dispose of it in one lot to the Municipality will sell it by instalments for building land, the municipality undertaking the expense of roads.

**Mr. Herbert Hammond** has completed his model for the statue of Her late Majesty Queen Victoria, which Lord Ashton is presenting to the town of Lancaster. It will be of white marble, rising to a height of 36 feet. It has been decided to place the statue in Williamson Park, overlooking the borough.

**A Statuette of Apollo** in bronze, standing on a round base of red marble, has been found by the divers at Antikythera. It is perfect with the exception of the right hand, which is wanting, but the divers, in spite of its small size, hope to recover it.

**A Claim** for compensation for damage to Bow Church, Cheapside, from the construction of the Central London Railway, came before the Common Serjeant and a special jury at Guildhall on Tuesday. The jury having adjourned to view the church, it was announced on their return that the case had been settled for 1,000*l*. and costs.

**The London County Council** have voted 15,000*l*. to cover the cost of the foundation of several blocks of working-class dwellings to be erected on the site of Reid's Brewery in Clerkenwell Road, which has been purchased by the Council to provide a portion of the accommodation for those displaced through the Holborn to Strand improvement.

**The Visiting Committee** of the East Sussex Council decided some time ago to proceed with plans and specifications for laying-out and planting the recreation grounds, gardens, &c., of the new asylum, and for that purpose appointed as landscape gardener Mr. William Goldring, of Kew, who has had much experience in works of a similar nature, to advise and prepare plans, specifications and estimates. In the estimate already approved by the County Council there was included a sum of 3,000*l*. for laying-out and planting, and as it would be advisable to undertake a considerable amount of planting early in the autumn, the County Council have authorised the committee to proceed with the work.

**An Important Scheme** for demolishing insanitary property and rebuilding artisans' dwellings on the cleared sites has been formulated by a special committee of the Council of Liverpool. The whole scheme involves a million and a quarter of money, which it is proposed to provide by a sinking fund extending over sixty years, involving an annual charge on the rates of nearly 40,000*l*. The number of houses to be demolished is over 6,000, and rebuilding is to go on at the rate of 700 dwellings yearly, the tenants preferred being those evicted.

**The London County Council** have decided to pay at once a deposit of 3,500*l*., or 5 per cent. on the purchase price of the Marble Hill property. The deposit is paid by the Council only to save the property from being built upon, and the completion of the purchase is conditional upon substantial contributions being received from other local authorities.

## Architect and Contract Reporter

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\*\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**BLACKPOOL.**—Sept. 16.—Competitive plans are invited for the laying-out of land to be added to the cemetery, with specifications, descriptions and estimates. Premiums of 30*l.*, 15*l.* and 5*l.* are offered. Mr. T. Loftos, town clerk, Town Hall, Blackpool.

**CAMBERWELL.**—Oct. 29.—Plans are invited for public baths and washhouses to be erected upon a site in the Old Kent Road. Premiums of 150, 75, and 50 guineas respectively are offered. The Town Clerk, Town Hall, Camberwell, S.E.

**CHELSEA.**—Oct. 1.—Competitive designs are invited for proposed new baths in King's Road, Chelsea. Premiums, 100 guineas, 50 guineas and 30 guineas respectively. Particulars at the office of the committee, 171 King's Road, Chelsea.

**PENZANCE.**—Sept. 1.—Competitive plans and estimates are invited for laying-out ground situate on the Western Promenade, to include a winter garden suitable for band and other concerts, and lavatory accommodation for ladies and gentlemen. Premiums of 21*l.* and 10*l.* 10*s.* respectively are offered for the best and second best designs. Mr. T. H. Cornish, town clerk, Public Buildings.

**SHEFFIELD.**—Aug. 31.—Plans and estimates are invited for the alteration of Eccleshall Church. The Rev. T. Houghton, Eccleshall Vicarage, Sheffield.

**WALES.**—Designs are invited for a chapel to be built at the top of Cathedral Road, Cardiff, at a cost not to exceed 5,000*l.* Mr. Thomas Evans, 102 Cathedral Road, Cardiff.

**WALTON-ON-THAMES.**—Designs are invited for new municipal buildings, fire-station and surveyor's residence. Premiums of 30, 20 and 10 guineas will be given to the three designs respectively considered the most suitable. Mr. Percy H. Webb, clerk to the Council, will supply all information.

## CONTRACTS OPEN.

**ARGENTINE REPUBLIC.**—December 10.—For construction of harbour works at Rosario. Particulars can be obtained at the Commercial Department Foreign Office, S.W., on personal application.

**ASHTON-IN-MAKERFIELD.**—Aug. 3.—For erection of additional retort-house, new coal stores, weighbridge office and culverting brook at the gasworks. Mr. Albert Sykes, clerk to the Council, Council Offices, Ashton-in-Makerfield.

**BATLEY.**—Aug. 21.—For erection of buildings and chimney-shaft for the Corporation electricity works. Mr. J. H. Craik, town clerk, Batley.

**BENWELL.**—Aug. 12.—For erection of the new Benwell Board school. Mr. J. W. Thompson, architect, 63 Gray Street, Newcastle-on-Tyne.

**BIRKENHEAD.**—Aug. 3.—For erection of Board offices, &c., in Birkenhead. Mr. E. Kirby, architect, 5 Cook Street, Liverpool.

**CHELMSFORD.**—Aug. 5.—For repairs, painting, &c., of the Ivy block and the laundry at the union house, Wood Street. Mr. W. W. Duffield, 96 High Street, Chelmsford.

**CHELMSFORD.**—Aug. 15.—For erection of one pair of labourers' cottages at the Hall Farm, Purleigh, and one pair of labourers' cottages at Skinners Wick Farm, Tolleshunt d'Arcy. Mr. F. Whitmore, architect, 17 Duke Street, Chelmsford.

**CHESTER.**—For alterations and additions to business premises, Newgate Street. Messrs. John H. Davies & Sons, architects, Newgate Street, Chester.

**DOWNHAM MARKET.**—For erection of a house at the gas-works. Messrs. Jarvis & Son, King's Lynn, Norfolk.

**DURHAM.**—Aug. 6.—For addition of a clerestory to the parish church of Ackworth, near Pontefract. Mr. C. Hodgson Fowler, architect, The College, Durham.

**FULHAM.**—Aug. 15.—For alterations and additions to the workhouse, Fulham Palace Road, Hammersmith, W. Mr. A. Saxon Snell, architect, 22 Southampton Buildings, Chancery Lane, W.C.

**GRAVESEND.**—Aug. 12.—For erection of electric-lighting and destructor buildings and chimney shaft near the canal basin. Mr. F. T. Grant, borough surveyor, Town Hall, Gravesend.

**GREAT MARLOW.**—Aug. 13.—For alterations and additions to the station buildings at Great Marlow, for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station, London.

**HALIFAX.**—Aug. 5.—For erection of a boundary wall at Caddy Field. Mr. James Lord, borough engineer, Town Hall, Halifax.

**HEREFORD.**—Aug. 13.—For erection of two officers' cottages and four attendants' cottages on the estate of the Hereford County and City Lunatic Asylum. Mr. Alfred Dryland, county surveyor, Shire Hall, Hereford.

# STURTEVANT

SYSTEM OF

## Warming & Ventilating.

STURTEVANT ENGINEERING COMPANY, LD.,

147 QUEEN VICTORIA STREET, LONDON.

GLASGOW, PARIS, BERLIN, STOCKHOLM, MILAN, AMSTERDAM.

**HORNCASTLE.**—Aug. 5.—For taking-down and rebuilding the bridge over a stream at Poolham, Woodhall. Mr. Henry White, surveyor, Horncastle.

**HORNINGSHAM.**—For erection of a vicarage, Horningsham, Wilts. Mr. Hans F. Price, architect, Weston-super-Mare.

**HOYLAKE.**—Aug. 12.—For erection of stables, cartsheds, engine-house, blacksmith's shop, general shops and stores on site adjoining the electric-lighting station at Hoylake. Mr. Thomas Foster, engineer, District Council Offices, Hoylake.

**HULL.**—For alterations and additions to 8 George Street. Messrs. Freeman, Son & Gaskell, architects, Carr Lane, Hull.

**IRELAND.**—Aug. 5.—For erection of the first section of a hydro at Strickland's Glen, Bangor. Mr. John Russell, C.E., architect, 22 Waring Street, Belfast.

**IRELAND.**—Aug. 6.—For erection of an addition to the infirmary (male side) at the workhouse. Messrs. Young & Mackenzie, engineers, &c., Belfast.

**IRELAND.**—Aug. 6.—For erection of five labourers' cottages at Loughlinstown, Rathdown. Mr. Henry Powell, C.E., architect, Loughlinstown.

**KING'S LYNN.**—Aug. 3.—For alterations and additions to the Naval Reserve public-house, St. Ann Street, Lynn. Mr. Herb. Tilson, architect, Railway Road, King's Lynn.

**KING'S LYNN.**—Aug. 8.—For erection of an infirmary building at the rear of the existing workhouse, Exton's Road, King's Lynn. Messrs. Charles Smith & Son, architects, Reading.

**LEEDS.**—Aug. 8.—For erection of a school-hall, &c., to new Congregational church, Shaftesbury Avenue, Roundhay. Mr. W. H. Beevers, architect, 26 Bond Street, Leeds.

**LEIGH.**—Aug. 5.—For covering a tar and liquor well at the gasworks. Mr. Peregrine Thomas, town clerk, Town Hall, Leigh, Lancs.

**MALTON.**—For erection of a water-gas plant at the gas-works, Malton, Yorks. Mr. Henry Tobey, engineer and secretary, Castlegate, Malton.

**NELSON.**—Aug. 24.—For erection of the new electric-light station in Charles Street, Nelson, for the electricity and tramways committee. Mr. B. Ball, A.M.I.C.E., borough surveyor, Town Hall, Nelson.

**NEWPORT.**—Aug. 5.—For erection of a library, technical institute, &c., at Newport, Isle of Wight. Mr. F. Newman, county surveyor, St. Thomas Street, Ryde, Isle of Wight.

**NORMANTON-ON-SOAR.**—Aug. 7.—For additions and alterations to the Normanton-on-Soar Board school. Messrs. Barrowcliff & Allcock, architects, Loughborough.

**PADDINGTON.**—Sept. 16.—For erection of mortuary buildings and chapel at the north end of Manor Place. Surveyor, Town Hall, Paddington.

**RADCLIFFE.**—For reconstruction, renewals, foundations, &c., to houses and shops and other property in Blackburn, Railway and Foundry Streets, Radcliffe, Lancs. Messrs. James Sellars & Son, architects, Union Chambers, Bury.

**RASTRICK.**—For erection of a mistal at Nunnery farm. Messrs. Jackson & Fox, architects, 7 Rawson Street, Halifax.

**REDRUTH.**—Aug. 15.—For erection of offices and stores as additions to existing business premises. Mr. Sampson Hill, architect, Green Lane, Redruth.

**ROCHESTER.**—Aug. 21.—For erection of a cabman's shelter at the Rochester Banks station of the South-Eastern and Chatham Railways. Mr. William Banks, city surveyor, Guildhall, Rochester.

**RUGBY.**—For alterations and additions to private hotel, Albert Street. Mr. J. T. Franklin, architect, 40. Bridget Street, Rugby.

**SALE.**—Aug. 9.—For erection of a meteorological and clock tower. Mr. A. G. M'Beath, architect, 2 Montague Road, Sale.

**SALFORD.**—Aug. 8.—For erection of thirty-two shops and dwelling-houses in Regent Road, on the site of the old infantry barracks. Mr. Henry Lord, architect, 42 Deansgate, Manchester.

**SALTBURN.**—Aug. 9.—For erection of a house on the Marine Parade. Mr. Edward A. Whipham, architect, 59 High Street, Stockton-on-Tees.

**SCOTLAND.**—For erection of a public school at Redding, Grangemouth. Mr. Alexander Gould, architect, Vicar Street, Falkirk.

**SCOTLAND.**—Aug. 3.—For additions and alterations at the Manse of Crimond. Mr. J. B. Dickie, 51 Queen Street, Peterhead.

**SCOTLAND.**—Aug. 5.—For erection of Ayr new town hall. Mr. J. K. Hunter, architect, 51 Sandgate, Ayr.

SEASIDE visitors who make use of the excellent service afforded by the Belle steamers would do well to send for the Company's Official Guide, which will be sent post free. The guide contains much interesting and useful information of a descriptive character concerning the daily trips to the various ports where the famous Belle steamers call. The guide is admirably illustrated throughout, and has also a capital map of the route. The guide is well worth perusing, it is thoroughly explicit, and graphically descriptive. Its price is only one penny.

At a meeting of Hawick District committee of the County Council it was reported that the estimates for the joint fever hospital, including furnishings, for the town and district amounted to about 12,000*l.*, being about double the sum originally stated. Various suggestions were made, such as that an iron hospital might be got at a cost of about 3,000*l.*, or that, in view of the decrease in the population, the number of beds in the proposed hospital should be reduced from 24 to 18. On the motion of the chairman the committee decided to suggest to the Town Council that the plans and specifications should be revised by a competent architect with a view to having the cost considerably reduced.

### ANSWERS TO CORRESPONDENTS.

ARCHITECT'S FEES.—(H. E. H.)—(a) The architect is entitled to charge half the commission upon the estimated cost. If he should, in addition, procure tenders in accordance with the instructions of his employer the charge is 2½ per cent. extra (which would in this case be upon the lowest tender). (b) The following are the professional services included in the ordinary 5 per cent.:

The requisite preliminary sketches, drawings and specifications sufficient for an estimate and contract, detailed drawings and instructions for execution.

In respect to the ownership of drawings and specifications, it has hitherto been the general custom for the architect to be paid for their use only, those documents remaining his property. No authoritative decision in the courts of law has, however, yet been given on the subject. It is, therefore, desirable, for the present at least, that the architect should have a direct understanding with his employer on this point. The architect is entitled to demand payment for plans and to keep them.

(c) In cases of this kind the architect generally gives his client a complete tracing of the drawings and a copy of the specification of the proposed buildings, the same having been approved by the local authorities.

WORKMEN'S COMPENSATION.—(G. W.)—The workman is entitled to compensation even if the building is not 30 feet in height, provided it is being erected by means of machinery.

### TRADE NOTES.

U. M. F. CHURCH, South Lambeth, is being fitted with the latest improved low-pressure hot-water heating apparatus by Messrs. John King, Ltd, engineers, Liverpool.

SPECIAL arrangements have, we are informed, been made by the Chancery Lane Safe Deposit Company for the temporary safe keeping of securities to meet the public, convenience during the holidays and the Long Vacation.

MESSRS. COUSLAND & MACKAY, ventilating engineers 150 Hope Street, Glasgow, have been entrusted with the ventilation of Malmesbury Park schools, Bournemouth, which they are carrying out by means of Mackay's patent direct-acting ventilators and improved air inlets.

A FINE large Cambridge quarter-chime clock, striking the hours on the tenor bell of 30 cwts. and the quarters on four smaller bells, with all Lord Grimthorpe's designs and improvements inserted, was set going on Saturday last for the first time, the work having been carried out by Messrs Wm. Potts & Sons, clock manufacturers, Leeds, to the order of the vicar and churchwardens.

### NEW CATALOGUES.

FROM Messrs. Pott, Cassell & Williamson, of Motherwell, N.B., we have received a series of illustrated leaflets descriptive of their laundry machinery, hydro-extractors, &c., for the latter of which they claim the following advantages:—That the extractor, being self-balancing, and having no rigid journals, no vibration is communicated to the floor; owing to the extra depth of the basket and width of the lip the capacity is greater than that of any other machine of equal diameter; no special foundation is needed; no part of the machine is under the floor-level; there are no working parts under the basket; all working parts are easily accessible, and at the same time protected by the frame; owing to the method of driving, the engine can be run at an economical speed; the engine is pro-

## THE YORKSHIRE PATENT GLAZING CO., LIVERSEDGE.

### "PREMIER" SYSTEM of GLAZING.

Absolutely the most improved and complete method of

WATERTIGHT GLAZING without PUTTY.

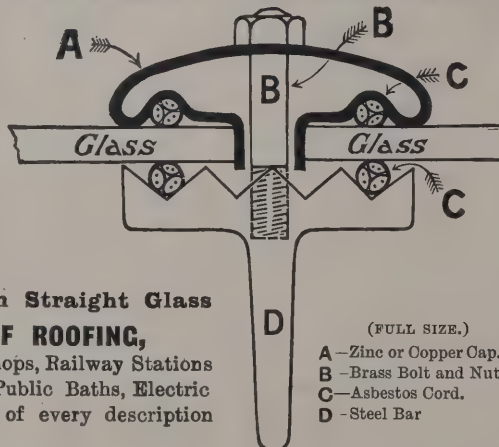

NO OUTSIDE PAINTING REQUIRED.

vided with a governor, which insures safety and regularity of work; higher speed, and about half the power that is required for machines with fixed bearings.

MESSRS. J. ASHTON RILEY, LTD., of Canal Boiler Works, Huddersfield, have forwarded to us one of their new priced and illustrated catalogues, which is a model of neatness and conciseness. The illustrations, which are numerous, consist of well-executed drawings of the company's well-known boilers, which are shown in great variety and are fully described and priced.

### VARIETIES.

MESSRS. ESSEX, NICOL & GOODMAN, architects and surveyors, announce that they have now removed from their old office, 8 Newhall Street, to new offices in Colmore House, 21 Waterloo Street, Birmingham.

THE new voluntary schools which have been erected in the Green Parlour Road, Writhlington, for the education of the children of Writhlington and Foxcote were opened on the 27th ult.

HER Majesty the Queen has been pleased to accept a copy of the édition de luxe of Mrs. Nevill Jackson's "History of Hand-Made Lace," which contains actual specimens of old and fine laces.

THE forthcoming Bank Holiday performances at the Royal Aquarium are to be continued in their entirety throughout August; commencing at 10 A.M. they will not terminate until close upon midnight. During each afternoon and evening performance a series of living pictures are shown by the bioscope of past and current events of interest, and twice daily Annie Luker dives from the Aquarium roof (a distance of 90 feet) into the shallow water below.

MESSRS. LEVER BROS., of the Sunlight soap works, have just opened at Port Sunlight a gigantic restaurant for the supply of cheap food to the girls employed by them. The hall consists of three wings, the east, central and west, can seat 1,300, has a floor space of 15,770 square feet, and is fitted with the best modern and improved cooking apparatus. The building was designed by Messrs. William & Segar Owen, Warrington, and built by Messrs. Beckett & Co., Hartford, and is a capital example of the architect's and builder's arts.

It is readily conceded that photography may be classed among the arts, and in the hands of the really skilful much beautiful work is now turned out which cannot fail to awaken admiration even on the part of those who are usually most apathetic. Architectural photography particularly lends itself to manipulation whereby results of a high order are obtainable, and among those who have achieved success in this particular line there are none, so far as we are aware of, in the provinces at least, who, judging by the admirable specimens submitted to us, have turned out better or more satisfactory work than Mr. C. R. H. Pickard, the well-known photographic artist of Leeds, whose knowledge of the subject is, we are assured, equal to any and all occasions. Special attention, too, is given by him to what is understood as technical photography, and abundant evidence is afforded of the happy results he has obtained in this important department; and his own high standard of excellence in photography, which is exercised in all parts of the country, does not deter him from giving his services when needed in enlargements or in the working-up of negatives of clients and others, while special attention is given by him to the reproduction of plans on a reduced scale, as well as to the preparation of lantern slides for lecturing or educational purposes. In the dry matter, too, of catalogue illustration, upon which from the business point of view, so much often depends, Mr. Pickard may be advantageously consulted, as his success in this department, especially where sanitary goods and appliances are concerned, is freely acknowledged.

THE Leeds and Yorkshire Architectural Society on the 27th ult. made an excursion to Giggleswick, to inspect the new chapel now being erected at the Grammar School. The donor is Mr. Walter Morrison, and the architect Mr. T. G. Jackson, R.A. A full inspection was made of the chapel, with its cedar carving, mosaics, sculpture, sgraffito work, stained glass, marble pavements and varied use of local stone, which together made the building one of the most beautiful and interesting in course of erection in the north. The visitors were entertained by the head-master (Rev. G. Style), and were conducted over the chapel by Mr. R. Evans (clerk of the works).

THE twenty-second edition of the Great Eastern Railway Company's "Tourist Guide" has just been issued, and it ably sustains the reputation acquired by its well-known forerunners. As heretofore, it is edited by Mr. Percy Lindley. A series of

181 QUEEN VICTORIA ST. E.C.

maps have been added. A fresh chapter will be found on the Tyrol, and some less frequented, and to many tourists on that account more attractive, districts near at hand have come within the scope of this handy guide. By the Royal Mail Harwich-Hook of Holland route fresh districts in Holland and North and South Germany, districts not yet popular and not spoiled, have been opened up. By the improved express service Norway, Denmark and Sweden are now brought within easy reach of the tourist sighing for fresh holiday fields. An added chapter on these districts will no doubt prove attractive and useful.

A PUBLIC meeting, presided over by Mr. D. W. Yates, was held in the Co-operative Hall, Radcliffe, Lancs, on the 30th ult., for the purpose of considering the question of erecting a new spinning mill in the town, with a view to giving an impetus to Radcliffe trade. A provisional committee, composed of local manufacturers and others, had been appointed to investigate the matter and report. The secretary now stated that the committee estimated that the cost of the mill would be 24s per spindle for the counts they proposed to spin. They proposed to have a mill of, say, 70,000 spindles, which worked out at 85,000s. He advanced figures respecting mills similar to the one proposed, and said several interviews had taken place with the ground landlords. Mr. Andrew Greenhalgh, in a short speech, remarked that they had had splendid sites at low rentals offered them. A resolution was adopted approving of the general scheme, and a committee was appointed to canvass the town with a view to ascertaining to what extent the public would subscribe.

### BUILDING AND BUILDERS.

LORD OVERTOUN laid the memorial-stone of the new St. Andrew's United Free church, Blairgowrie.

PLANS have been passed for a new parish church which it is proposed to erect at Somercotes, Notts, at a cost of 5,000s.

MR. W. A. DUCAT, A.M.I.C.E., held a Local Government Board inquiry at Frodingham, Yorks, into the application of the Urban District Council to borrow 1,600s. for the purposes of building Council offices, &c. There was no opposition.

THE Lord Provost's committee of Edinburgh Town Council has recommended the acceptance of contracts, amounting in all to 5,797s., for the contemplated extension of Edinburgh public library. Property in the Cowgate was purchased some

time ago, and to meet the growing demand on the accommodation of the library it is proposed to proceed with the work as soon as possible.

THE contract for pumping machinery in connection with the second artesian boring recently completed at Gainsborough (the largest in this country for waterworks purposes, the well being nearly 1,500 feet deep), has been placed with a Belfast firm, the amount of their tender being 6,150s. The borehole pump will be of a novel design, embodying the principle of multiple valves for both suction and delivery, which will give a much larger waterway than the ordinary form of single valve.

POWERS were obtained some time ago by the Corporation of Blackpool to widen the promenade 60 feet westwards, and it came as a great surprise to the Corporation a month ago to hear that this would only provide a promenading space of 13 feet at the outside, the other space being taken up with the roadway and tramtrack. The new surveyor has put forward a scheme to carry the promenade westwards a distance of 100 feet, his estimate for the additional width being only 45,000s. over the estimated cost of 300,000s. for the smaller widening. The sub-committee who have the matter in hand have adopted the larger scheme for recommendation to the town council at its next meeting.

MR. M. K. NORTH, inspector to the Local Government Board, held an inquiry on the 25th ult. at the Aston Council House as to the application by the Council to borrow 750s. for works of sewerage, and 350s. for the erection of a convenience within the boundary of Aston Park, fronting Trinity Road. Mr. Joseph Ansell, on behalf of the Council, explained that in November last while certain work was being done at some newly-erected houses in Barton Street, it was ascertained that the sewers were in a most insanitary condition, in fact in such a state that they proceeded to do the work before applying to the Local Government Board. The inspector afterwards visited the parts of the district concerned.

A PLOT of land fronting Market Street, opposite the Glebe Mill, Westhoughton, Lancs, has been secured by the Urban District Council as the site for the intended new Town Hall; the area of the land, which has been obtained from the owners of the Glebe Mill (the Westhoughton Manufacturing Company) being about 2,100 square yards. Preliminary arrangements have also been agreed upon for erecting the new edifice.

FOUNDATION-STONES have been laid of a new church and Sunday school on the Pye Nest estate, Halifax. The chapel

will be entered from Upper Washer Lane, and will be 50 feet long, 37 feet broad and 27 feet high, and it will accommodate 320 people. The organ chamber is to be recessed from the chapel. On the one side will be the minister's vestry, and on the other a staircase leading down to the school, which will be immediately under the chapel, and owing to the rapid fall of the ground will be well lighted on both sides. Four classrooms are to be provided on this floor, opening out of the schoolroom, together with a vestry for the choir, entrance and staircase hall, &c. The school entrance will be from Washer Lane, and will be about three steps up from the road level. A kitchen, heating apparatus chamber, coal and coke cellars, &c., will be provided in the basement. The buildings will cost about 2,500*l.*, and will be well and substantially built of Southwark stone with ashlar dressing to front elevation, the interior work being carried out in pitch pine varnished. The architects are Messrs. R. Horsfall & Son.

THE foundation-stone has been laid in Birmingham of a new Central Hall which is being erected by the Birmingham Wesleyan Methodists, and is said to be the largest building of the kind in the country belonging to the Connexion. Its site is in the heart of the city, being nearly opposite the Assize Courts, and is designed in the free Renaissance style, in which so much of central Birmingham is being rebuilt. It covers an area of 2,766 square yards, and has frontages to three streets—to Corporation Street, which is the main elevation, measuring 224 feet, to Ryder Street 113 feet, and to Dalton Street 276 feet. In the centre of the building is a fine tower, rising to a height of 180 feet. On the ground floor are fifteen shops, with basement shops, together with sale-rooms, large warehouses and other offices for commercial purposes. One large basement, capable of accommodating 500 children, will be retained by the mission as a ragged school, and will be fitted up with suitable cooking arrangements for the feeding of the poor in times of need. On the first and second floors are the large hall, synod hall and other rooms for Methodist purposes. The main entrance under the tower leads into a spacious hall, where two easy staircases lead to the first-floor landing. Here, by turning to the left, access is gained to the synod hall and church house, and by turning to the right and ascending a few steps the level of the great hall is reached at the platform end. The corridors which run round the great hall give access on the outside to twelve committee-rooms, and on the inside are frequent entrances to the great

hall. The hall is 140 feet long, 90 feet wide upstairs, and 48 feet high, with seating accommodation for 2,300 persons (300 being on the orchestra and 2,000 in the auditorium). There are no seats under the gallery, so that the speakers have a low platform and an undivided audience. On the lower or left-hand side of the tower is the church house. The corridor leading from the stairs already mentioned has on its left (or Corporation Street side) a large committee-room and the synod hall, which will seat 500 persons, and on the right another large committee-room and the Sunday school. Along the corridor are two large and commodious rooms, the library and the ladies' parlour, which look out on Ryder Street. On the floor above are twelve club and classrooms of various sizes for conducting the work of the mission. There are in all five entrances with good staircases. The chief material employed in the façade is red terra-cotta. Great attention has been paid to ventilation, lighting and heating. The entire cost of the scheme is estimated at from 60,000*l.* to 65,000*l.*

#### LEIGHFORD PARISH CHURCH RESTORATION.

AT a public meeting held on the 18th ult. to consider what steps it was advisable to take in connection with the proposed restoration of Leighford parish church, the Vicar read the architect's report, which stated that the Norman church consisted of a nave of at least four bays, most probably with narrow aisles upon both sides, all under a roof of one span. The church was cruciform, and probably triapsidal, evidences remaining of a low arch, which most likely opened into an apse upon the north side. The general setting out of the plan did not suggest a central tower, but an example close at hand of a Norman western tower was suggestive of the same treatment there, and he imagined that its collapse might have caused the destruction of the south side of the church and possibly also the west end of the Bridford aisle, which led to the extensive operations of 1748. The original Norman chancel gave way to a Geometrical construction at the end of the thirteenth century. The next great change in the form of the fabric was the destruction of the Norman north aisle and Early Decorated chapel to make way for the Bridford aisle erected in the fifteenth century. Afterwards it was possible that the church was neglected and allowed to go to ruin, thus necessitating the drastic and disfiguring works completed in 1748, which left the church in its

present state. The unfortunate transformation of that date went far to obliterate the history, as it largely destroyed the beauty of an interesting fabric. With regard to the present treatment of the church, he suggested that the stonework of the Norman arcade should be divested of cement and sham pointing. For the general appearance of the church the recovery of the Norman arcade would be a great gain, but this would involve great expenditure, as a new tower, a bay further westward, would have to be built. Assuming that to be beyond possibility, so far as might be, the Norman arcade should be exhibited to the church upon the Bridgford aisle side by finding a new place for the vestry. This could be conveniently done by placing it at the east end of the aisle in the space now useless. This vestry would be screened from the church partially by the organ slightly moved in position and partially by oak screens, which could have a decorative character. The whole area of the church would thus be brought into use and the vestry placed very conveniently near the choir. The choir arcade should be replaced, the square pews in the choir removed, and new stalls set out. The choir is not central with the nave nor with the chancel arch, but it would be possible to arrange the stalls so as to appear symmetrical with all. The south door should be opened out and provided with a wire door so as to gain means of airing the choir in summer time. The choir and nave are on the same level, not at all an unusual arrangement with Mediaeval builders. This ought not to be disturbed, but the holy table might be slightly elevated. To complete the east end there should be a new east window in the Bridgford aisle. The existing seating might be used up by being cut down and adapted to proper dimensions. The floors should be lowered to their original level and laid with wood blocks and either wood or tiles in the passages. It would be possible to use up the greater portion of the timbers in constructing the roofs, such a reconstruction being necessary, as the tie-beams were too much cut about and the general reconstruction too rough and ungainly to show nakedly in the present state. The choir roof should be lowered to its proper height. The irregular plan of the Bridgford aisle made a construction of an open high-pitched roof with eaves exceedingly difficult and virtually impossible of success. The proper course would be to restore the flat-pitched roof with parapets. Regarding the 1748 brickwork, this ought to be entirely a matter of design. The present architecture was so uncouth and ugly that nothing could redeem it. Had it been an honest piece of Classic design of

the period he would have retained it, but it was a piece of pretence Gothic, having no character but ugliness. He suggested, therefore, that either new windows should be inserted in the brick wall, or, better still, that the latter should also be recased. The tower, although of slight proportions, appeared to be perfectly stable, with the exception of the stonework of the west belfry window, part of which was in danger of falling. Referring to the question of heating apparatus, he remarked that a flue ran up the tower which might be utilised for a low-pressure apparatus placed in a vault under the west end of the Bridgford aisle. The fact that some underpinning was wanted in that position made the construction there still more desirable. The heating would be mainly by radiators, as pipes under gratings on the floors caused draughts and were objectionable for sanitary reasons. He estimated the probable cost of carrying out his suggestions at 4,905*l.*—3,105*l.* for the work in the church and 1,800*l.* for the tower work.

Colonel Dobson proposed that efforts be made to raise funds to carry out the restoration of the church, and that a committee be formed of subscribers of not less than 5*l.* to carry out this object.

Mr. Collier seconded the resolution, which was carried unanimously.

#### THE VICTORIA EMBANKMENT, NOTTINGHAM.

THE new embankment constructed by the Nottingham Corporation along the north side of the Trent, from Trent Bridge to Wilford Bridge, to be known as the Victoria Embankment, was opened on July 25 by Alderman Lambert (chairman of the public parks committee), in the presence of the mayor (Mr. F. R. Radford), the members of the Corporation, and a large attendance of the general public, the event marking the completion of one of the largest and most acceptable schemes of improvement undertaken by the Corporation for many years. The idea of constructing a riverside boulevard and promenade, says the *Nottingham Guardian*, was conceived some sixteen years ago, the suggestion being made to the Corporation by Mr. Arthur Brown, the city engineer. Owing, however, to the difficulty and great cost of the scheme it was not entertained until recently, when the necessity of providing some means of checking the ravages of floods and increasing the facilities for outdoor recreation in a district whose population was going up by leaps and bounds compelled attention to the

execution of some such work as has now been handed over to the inhabitants of Nottingham. It is fortunate for the city that Colonel Bruce had as his surveyor Mr. Robert Evans, whose sympathies were very early enlisted in favour of the scheme, and who has all through given it his hearty co-operation. Very little progress was made with the work until the advent of the Great Central Railway, which company purchased compulsorily a large amount of property from the Corporation, including the recreation ground on the east side of Queen's Walk and a large slice of Bulwell Forest. The Corporation then obtained power to devote the money received from the sale of lands and properties to the purchase of additional recreation grounds and to the carrying out of this undertaking. A piece of land abutting on the proposed embankment, and having an area of 24 acres, was purchased from Colonel Bruce to be used as a cricket and football ground, and an agreement was entered into at the same time between Colonel Bruce and the Corporation settling definitely the conditions upon which the road should be constructed. Colonel Bruce gave up sufficient land, having an area of about 24 acres, for the formation of the road, and thus the Corporation obtained control of the river on the north bank from Trent Bridge to Wilford Bridge, the acreage quoted being the area of land only and not including the area of half the river, which was at the same time conveyed to the Corporation. The next point which required grave consideration was whence to obtain the necessary material for filling up the road to a level which should be well above the reach of floods, and it was found that the height to which the ground would have to be raised varied from 6 feet to 8 feet on the line of the new carriageway. The river Trent had been neglected for a score of years, and the only dredging which had taken place was that done by the owners of the ordinary gravel boats, whose sole object was to get fine gravel, and who had no interest whatever in keeping open a channel for the free passage of flood waters. It was suggested by the city engineer that if the material were obtained from the river it would serve two important objects—increase the waterway of the river, which would have an important result in time of high floods, and provide good material for the filling up of the road. Mr. F. Raynor, the engineer of the Trent Navigation Company, was approached on the subject, and he gave his hearty co-operation, recognising that whatever was done in the way of dredging on a large scale would benefit the river and relieve for a time the Trent Navigation Company of their obligations in

this direction. The sanction of Parliament having been obtained in the Nottingham Improvement Act 1897, instructions were given to the city engineer. No time was lost in the preparation of working drawings, and the contract for the piling, concreting and hauling the gravel, &c., when delivered by the Trent Navigation Company, and other works were let to Mr. A. Kellett, the sub-contractor for the laying-out and planting of the grounds being undertaken by Mr. W. Bardill, and for the supply of the ironwork by Mr. Andrew King. Operations were commenced in May 1898, and on May 26 in that year the first pile was driven by Ald. Lambert, as chairman of the public parks committee. The embankment is about a mile and a quarter in length, occupying 24 acres of land. The total width of land occupied by road, verges, slope, &c., varies from 170 feet to 250 feet. The roadway is 36 feet wide, and is channelled with granite cubes, the remainder of the carriageway being laid with tar macadam. On the north side is a footway 10 feet wide, and between this and the carriageway is a grass verge 10 feet wide and a narrow footway 5 feet wide. On the south side the narrow footway and grass verge are repeated, but the principal footway is 15 feet wide. The paths are all asphalted, and each grass verge has a row of trees planted down the middle. Between the 15-foot footpath and the river is a grass slope of varying width, nowhere less than 70 feet, and in some places 150 feet wide. Along the slope a row of trees has been planted. The grass slope terminates at the hauling path, which is 10 feet wide, and from the south edge of the hauling path there are constructed continuous concrete steps, seven in number, each step being 1 foot high. The bottom of these steps is protected by continuous piling; the king piles, 9 feet apart, are 12 inches by 12 inches, and the sheet piles, which are continuous, are 11 inches by 4 inches. The steps form a pleasing walk, from which fishermen can ply their gentle craft, and for those who do not care to sit upon the concrete steps about 150 new seats have been provided and placed on the walks. The embankment naturally follows the windings of the river, which are very numerous, and add certainly to the beautiful appearance of the road. At the Trent Baths the space at the back of the baths has been planted with shrubs, &c., the appearance being most pleasing. At the Wilford Bridge end there is a large plantation which, when grown, will hide the somewhat unsightly outline of the Wilford Bridge approach. The slopes at the Great Central Railway goods yard have been planted with trees and shrubs, and at the top

of the slope there is a privet hedge. Some figures may be of interest to show the amount of material swallowed up in the work. The material required for the filling up of the roads represents about 300,000 tons; the number of piles used is 7,300; the area of turf is 18 acres, and the length of concrete steps equals nearly 10 miles. The length of iron fencing is about 7½ miles. In 20 years or so, when the trees have grown so as to provide the shade necessary in hot weather, the beauty and utility of this walk and promenade will be greatly enhanced. It is confidently anticipated that the embankment will be of lasting benefit to the inhabitants of Nottingham, and it is hoped that steps will be taken by some authority to improve the southern banks of the river, so as to insure the public access to the river and its foreshore. The whole of the works have been designed and carried out by Mr. Arthur Brown, M.Inst.C.E., the city engineer, who, as referred to previously, has been mainly responsible for the initiation of this great work.

### UNDERGROUND RAILWAYS IN LONDON.

THE following report from the Joint Select Committee of the House of Lords and the House of Commons on London-underground railways has been issued:—

1. The committee have met and considered the matters referred to them, and have taken evidence in respect of the lines of route for underground railways which have been proposed by Bills introduced during this session. The order of reference is as follows:—

(1) Whether the lines of route for underground railways in and near London, proposed by Bills which have been or may be introduced during the present session, are best calculated to afford facilities for present and probable future traffic; and, if not, what modification of those lines of route are desirable;

(2) What special provisions (if any) should be made for the protection of the owners, lessees and occupiers of properties adjacent to underground railways from possible damage and annoyance;

(3) What special terms and conditions (if any) as to construction and working should be imposed upon the promoters;

(4) Whether any, and which, of the schemes proposed by the said Bills should not be proceeded with during the present session.

2. Looking to the general terms of reference it appeared to

the committee that these Bills were not to be considered and dealt with by them as by ordinary private bill committees to whom they might have been referred; that the committee had not, for example, to deal with the financial questions that ordinarily arise, nor with any special engineering details, and only partially and indirectly to consider questions of competition. They therefore called for no evidence upon these points.

3. For the purposes of this report the committee adopted the map handed in by Sir Alexander Binnie, on behalf of the London County Council, of the London Tube Railways, 1901, showing all lines open to traffic, in progress, authorised and proposed, from which it will be seen that the needs of considerable areas are unprovided for, specially north of the river in the neighbourhood of East and West Ham, and south of the river between Greenwich and Dulwich. This is possibly accounted for by the fact that the subsoil is of such a character as to make the construction of underground railways very costly.

4. The committee have had before them ten Bills proposing lines of routes for underground railways in and near London, or extensions of already authorised lines.

5. The difficulty in dealing with the question of the best routes is greatly increased by the fact that a considerable number of underground railways have already been authorised by Parliament; some of these have not been commenced, while others have been only partially constructed. It is obvious that any conclusions as to the best lines of route, or modification of the schemes now before Parliament, must be materially influenced by this fact.

6. The committee think it may be useful to state, in the first instance, some general points which they suggest should be borne in mind when dealing with this question of routes.

(a) Underground railways or underground tramways in London and its immediate suburbs, which can be hereafter extended if required, above or below ground, into the country, but from the termini of which passengers could, for the present, proceed by electric surface tramways, omnibuses, and so forth, appear to be the best mode of dealing with the present traffic and the probable requirements of an increasing population.

(b) These underground railways or tramways should run from well-recognised centres of traffic to other like centres of traffic, or from centres of traffic to districts whence large numbers of people have to be carried daily to and from their work in London or the suburbs.

23 Sutterton Street,  
LONDON, N.

(c) It is desirable that Parliament should carefully investigate the circumstances under which authorised lines apply for an extension of time. The result of many of the authorised railways having remained in abeyance for a considerable number of years has been in some cases to prevent other companies coming forward to make lines along the same route. The renewal, therefore, of lapsing powers should not be granted without the most careful consideration as to the probability of a company which has already failed to carry out its obligations to the public being able by an extension of time to fulfil those obligations within a reasonable period.

(d) The committee have been informed that the London County Council have had difficulty in getting a *locus standi* to oppose the renewal of powers before Parliament because they have not opposed the original scheme. The committee are of opinion that the County Councils and the City Corporation should be granted a *locus standi* in all such cases where they are concerned.

(e) The underground lines may be worked at the termini on the shuttle system, or by means of terminal loops. Which system should be adopted in each case is a question for the parliamentary committee to which the Bill is referred. But while the advantages to the working of the line by loops are obvious, and in outside districts there can be no objection to them, the committee think that very great caution should be exercised by a committee in sanctioning them in the heart of the City, on the ground of the large amount of space occupied to the possible exclusion of future railways. They have the less hesitation in making this recommendation as the multiple motor system, by which much time is saved in shunting at terminal stations, appears likely to be adopted in future.

(f) Confluent junctions inside tubes should be avoided, nor are they desirable in the open where the service of trains at the converging point is very frequent, since slight detentions on one line impair the service on both.

(g) We concur in the recommendations of the joint parliamentary committee of 1892 as to the acquisition of wayleaves in the case of private property, and in the case of passing under the streets.

(h) One of the main objects of underground railways being to relieve traffic in congested places, it is desirable that stations should be so constructed as to avoid, as far as possible, the discharge of passengers into crowded streets. Interchange stations should, where practicable, be placed at all points where underground lines cross one another, and should be connected

by subways so as to facilitate the passing from one system to another underground.

7. Damage and annoyance to the owners, lessees and occupiers of properties adjacent to underground railways may occur through one or other of the following causes:—

1. Subsidence due to construction, especially to the construction of a station.

2. Vibration due to the working of the railway.

(1) The committee did not think it desirable to receive evidence on the general question of underground railways causing subsidence; they considered that each case of probable or alleged subsidence must be judged by the circumstances of the particular case.

(2) The committee found that a special committee (known as Lord Rayleigh's committee) was examining fully into the question of vibration, and it was decided, therefore, not to enter upon this part of the reference.

It was, however, thought desirable to have some short statement as to the proceedings of Lord Rayleigh's committee, and at the second sitting a memorandum was handed in by the late Sir Courtenay Boyle. It concluded with the following statement:—

"The committee may, in the meantime, say that from the information already obtained they believe that on new tubular railways, under proper conditions, no objectionable amount of vibration need be apprehended, but they abstain from a definite recommendation until the further experiments above alluded to are completed."

To wait for the final report of Lord Rayleigh's committee would have necessitated considerable delay. As soon, therefore, as the evidence and arguments of counsel were concluded, the committee decided to report upon the other parts of the reference, and to deal with the future report of Lord Rayleigh's committee by the following general recommendation, namely:—

A clause should be inserted in every Bill binding the company to adopt and give effect to the recommendations, &c., which Lord Rayleigh's committee may make.

As regards a line already authorised, such a clause can be properly imposed, if and when application is made to Parliament for an extension of time or of works.

8. The committee find a want of uniformity in the clauses imposing upon companies an obligation to run trains in the early hours of the morning for the accommodation of workmen at specified fares; but every Act should contain clauses imposing these obligations, and the clauses in the Central London

Railway Act 1900, with some modifications suggested by the representatives of the Corporation of London and London County Council, appear well adapted to secure the desired object.

9. The committee have taken a considerable amount of evidence as to through fares for the various systems of railway proposed, and as to uniformity of fares. While there would be obvious advantages to the travelling public in both these proposals and they would commend them to the consideration of the various companies, they cannot make any practical suggestion for their adoption so long as the interests involved are in various hands, but they recommend that the Board of Trade should make a report to Parliament every five or ten years on the working of these railways, of their relations to one another and on the reasonableness of the fares charged thereon. They consider that such a report while giving no absolute power regulating the conduct of the railways, would have a very strong moral effect in inducing the companies to take a reasonable view of their duties to the public.

10. The committee proceed to report upon the several schemes for underground railways proposed by Bills introduced during the present session from the route point of view, leaving, as above stated, ordinary financial questions and other details to parliamentary committees.

The Bills that have been referred are as follows:—Central London; Charing Cross, Euston and Hampstead, No. 1 and No. 2; Islington and Euston; King's Road; West and South London Junction; City and North-East Suburban; North-East London; Brompton and Piccadilly Circus; Charing Cross, Hammersmith and District; Piccadilly and City.

11. The Central London Railway apply for power to make loops at each end of their line, so as to enable them to increase the number of trains and thus facilitate traffic. It appears to the committee that there can be no objection to the proposed loop at the western end of the line. There is more difficulty with respect to the proposed loop at the east end of the line. This Bill may be referred to a parliamentary committee in the ordinary course, subject to the remarks contained in paragraph 6, sub-section (e).

12. Charing Cross, Euston and Hampstead, No. 1 and No. 2—These Bills may be referred to a parliamentary committee in the ordinary course. The committee think there should be no confluent junction on the authorised line. One of the branches should join end on, and the other should be connected by an interchange station. There should be no

difficulty in securing this, as the works of the authorised line have not been commenced.

13. Islington and Euston.—This Bill may be referred to a parliamentary committee in the ordinary course.

14. King's Road.—This Bill may also be referred in the ordinary course if interchange stations are provided at Victoria. An extension to Putney Bridge would be desirable.

15. West and South London Junction.—This Bill may also be referred in the ordinary course.

The question has been raised whether there should not be an end-on junction with the North-West London, which might involve the abandonment of the line between the Marble Arch and Paddington station. On the whole, the committee think that the proposed scheme is the best, as securing the direct through route between Paddington and Victoria stations.

16. It will be convenient to consider the City and North-East Suburban and the North-East London together.

(a) An extension further north of the North-East London would be very desirable, especially in view of the area of land taken by the County Council for building purposes. The committee are of opinion that the Chingford branch is not wanted if the City and North-East Suburban is sanctioned.

(b) The committee consider that that portion of the City and North-East Suburban route from the centre of the City along Bishopsgate and thence turning to the east of Victoria Park is not desirable, and they suggest that (unless engineering difficulties prevent it) a better route would be eastward from the centre of the City, along Leadenhall Street, or other streets in like direction, and thence in a north-easterly direction to Victoria Park. This would prevent the overcrowding of Bishopsgate with tubes, and would also bring communication to an overcrowded district of Whitechapel, which otherwise would remain without these facilities of rapid transit.

(c) Subject to the above remarks, it appears to the committee that both these schemes may be referred in the ordinary course, as they both afford great facilities to crowded districts, and to districts where building is increasing and likely to increase.

17. Brompton and Piccadilly Circus, Charing Cross, Hammersmith, and District, and Piccadilly and City.

The committee are of opinion that there ought to be one through line from Hammersmith along Piccadilly to Piccadilly Circus and the City. They consider it most desirable that there should be an end-on junction between the Hammersmith line and the City and Piccadilly at or near Piccadilly Circus.

## BUILDING SPECIALTIES.

The B. & S. FOLDING GATE COMPANY are making a feature of the following among other leading BUILDING SPECIALTIES:—

B. & S. PATENT FOLDING GATES.

KINNEAR STEEL ROLLING SHUTTERS.

ART METAL WORK, GRILLES, ETC.

PATENT INTERLOCKING RUBBER TILING.

CABOTS SHEATHING AND DEAFENING QUILT.

LIFTS FOR ALL SERVICES.

AUTOMATIC TRAP DOOR & SKYLIGHT OPENERS.

TURNED & PRESSED WOOD SPINDLES & MOULDINGS.

QUIMBY ELECTRIC PUMPS, ETC.

19, 20 & 21 TOWER ST., UPPER ST. MARTIN'S LANE,  
LONDON, W.C.

## THE CORBIN LIQUID DOOR CHECK & SPRING

(The Latest and Best from America).

It Prevents Banging, but Latches the Door.

Right Hand.

IS REPLACING OTHER CHECKS EVERYWHERE and is being Specified by Architects for Board Schools, Public Buildings & Private Houses.

### BECAUSE

It is quicker and more positive in action, reducing the draught to a minimum.

It never allows the door to bang.

Main Working Parts are Dust-Proof, and They never require Oiling or even cleaning.

Perfect regulation of Speed.

Absolute regularity of action.

The Liquid forming the check to the Spring is composed of ingredients not affected by extremes of temperature.

Superior design, construction and appearance.

Patented everywhere.

Will work for years without attention.

Simple provision for taking up wear of joints after very long use, again making the check as good as new.

Also Holders for Spring Doors & other Specialties

FOR SALE BY

Leading Ironmongers Everywhere.

SOLE IMPORTERS—

F. C. SOUTHWELL & CO.

75 SOUTHWARK ST., LONDON, S.E.

F. C. S. & Co.'s Agents for Manchester and surrounding district—BAXENDALE & Co., Miller Street, Manchester.

Failing that, the alternative junction at Charing Cross should be adopted so as to secure a through route.

18. The committee under the circumstances do not approve the proposed extension of the Brompton and Piccadilly Circus line to Bloomsbury Square, but if the through line from Hammersmith to the City can be secured, an extension to the Angel, Islington, from Piccadilly Circus, with an interchange station at the latter place, would be a useful route, and should receive favourable consideration.

19. In the course of their deliberations the committee have had brought under their notice several matters which do not appear to lie distinctly within the terms of their reference. Of these the most important was the proposal that all these underground railways should be subject within certain limits to the control of a central authority. On this the committee desire to make the following observations:—

The question of underground railways in London and the suburbs and of their working is so complicated and of such importance from a financial as well as traffic point of view, that the committee are disposed to agree with the views of the Corporation of London and the London County Council, that in some way there should be a more direct control and supervision of all projects for such underground railways. Whether this should be effected by the supervision of some public department as the Board of Trade, or by some body like the Light Railways Commission, or by a joint committee of members of both Houses of Parliament, appointed at the beginning of each session, to consider all projects affecting the relief and distribution of traffic in or near London, is a question which appears to them to deserve serious consideration.

20. The railways should be constructed on sound economical principles and without undue inflation of capital. It is obvious that if dividends are to be paid on inflated capital, fares to produce such dividends must be on a scale higher than would be required to pay a fair remunerative interest on the money expended on the works. The Light Railways Act gives power to the local authority to construct or to assist in the construction of light railways, and the committee are of opinion that some such power given to the City Corporation and the County Councils concerned in respect to London underground railways would be of the greatest advantage. They therefore recommend that the Board of Trade should insert in each Bill a model clause based upon that in the Light Railways Act, with such modifications as may be necessary, giving powers to the

City Corporation or the County Councils in the counties, in which the railways would be constructed, either to construct or to aid in the construction of the lines.

21. Such powers would enable the Councils to encourage, by subsidy or otherwise, the prolongation of railways into districts thinly populated, and therefore suitable for the relief of congested districts, whereas, in many cases at any rate, a public company would not feel justified in extending their line till the population became greater.

22. It has indirectly been brought to the notice of the committee that another system of underground locomotion—namely, that of subways or shallow tunnels immediately under the surface of the roadways—has been successfully developed and is in progress of further extension both on the Continent and in America.

The committee have heard no evidence with regard to this system, but in view of the large amount of capital involved in the schemes now before Parliament, and the importance of utilising it to the best public advantage, the committee recommend that an early inquiry should be held by the Board of Trade upon this system.

### ST. AGATHA, SPARKBROOK.

THE new church of St. Agatha, at Sparkbrook, Birmingham was dedicated by the Bishop of Worcester on Saturday the 20th ult. It occupies a site adjoining the Board schools in the Stratford Road, and has been erected from the designs of Mr. W. H. Bidlake, and under his superintendence. It is a building of lofty proportions and has massive walls in the late Decorated Gothic style, with an original interpretation of traditional forms, and accommodation is afforded for more than 1,000 worshippers. The materials employed are buff brick facing within and red and blue brick without, with Hollington stone and Bath stone dressings. The roofs are covered with grey-green Whitland Abbey slates. Much of the eastern part of the church is hidden by surrounding buildings, but this is compensated for by an imposing west front and lofty tower facing the Stratford Road. The tower is 120 feet high to the top of the parapet, and is surmounted by a flèche rising 40 feet higher. It is constructed to house eventually a peal of eight bells, and the large belfry lights in the upper part of the tower form an important feature in the design. The gilt skeleton dials of a clock adorn the north and south sides of the tower. Below the belfry is the ringing stage,

## THE UNION PLATE GLASS CO., LTD., POCKET NOOK, ST. HELENS

Telegrams, "Union, St. Helens." Nat. Tel. 48.

ESTABLISHED 1837.

Makers of Ground, Smoothed, Polished, Silvered, Bevelled, Brilliant Cut, and Bent Plate Glass; Rough Rolled and Rough Cast Plate Glass; also of Rough and Polished Prismatic Glass, &c., &c.

### SPECIALITÉ: "REFRAX" (Protected under Patent Acts).

Extracts from Testimonials received:  
"The 'Refrax' Glass is a GREAT IMPROVEMENT."

"Gives EVERY SATISFACTION."

"The Glass I am perfectly satisfied with; GREAT SUCCESS."

"Compared with Polished Plate Glass 'Refrax' gives TWICE AS MUCH LIGHT for EQUAL COST."

Sold by all Dealers.

Interior Lighted by ordinary Plate Glass.

Same Interior lighted by "Refrax" Glass.

## HIGH-CLASS JOINERY & SHOP FITTERS & AIR-TIGHT CASE MAKERS

The PARKER'S JOINERY & CABINET CO. Ltd.  
CONYBERE STREET, BIRMINGHAM.

Branch Office—30a WHARF ROAD, CITY ROAD, LONDON, N.

Manufacturers of Fittings for Churches, Banks, Public Buildings, Offices, Hotels, Schools, Libraries, Warehouses, &c.

CONTRACTORS TO H.M. OFFICE OF WORKS, WAR OFFICE & ADMIRALTY.

**Wood Mantels & Overmantels a Specialty.**

Large Quantity of English-made DOORS, WINDOWS & MOULDINGS kept in Stock.

lighted by coupled windows in each face. From the base of the tower projects a semi-octagonal baptistery, over which is the west window, which is in turn surmounted by elaborate sculpture in canopied niches, representing Christ in majesty, supported by the angels of Justice and Pity, and surrounded by angels. On the north and south sides of the tower, and forming with it a symmetrical façade, are lofty porches, whose tympana are filled with sculpture illustrative of the martyrdom of St. Agatha, while the arch mouldings are decorated with cherubs' heads. The carved inscriptions "Enter into His gates with thanksgiving" and "Enter into His courts with praise" run under the projecting porch eaves. The interior consists of a nave 120 feet long and 29 feet wide, separated from wide aisles by arcades of Hollington stone arches. Projecting shafts rise between the arches and, terminating at the cornice level, in corbels of leaf sculpture, carry transverse timber arches supporting the timber ceiling, which is partly decorated in colour. The clerestory is lighted by elaborate traceried windows, nearly every window being of different design. The chancel is also terminated with an elaborate traceried window, which it is hoped may be filled with painted glass. The chancel is separated by arcades from a choir transept, over which is the organ chamber on the north side, and from an ambulatory which communicates with the vestries on the south. The choir seating is of fumigated oak, that of the nave being of sequoia wood. The pulpit is also of fumigated oak set on a stone base. The builders were Messrs. John Bowen & Sons.

### SEWAGE DISPOSAL.

AN interim report from the Commissioners appointed in 1898 to inquire into the disposal of sewage has appeared. The following are the conclusions:—

1. We doubt if any land is entirely useless, but in the case of stiff clay and peat lands the power to purify sewage seems to depend on the depth of the top soil. There are, of course, numerous gradations in the depths of top soil which are met with in nature, and it is not easy to draw the line between lands which contain a sufficient depth to justify their use and lands which do not. We are, however, forced to conclude that peat and stiff clay lands are generally unsuitable for the purification of sewage, that their use for this purpose is always attended with difficulty, and that where the depth of top soil

is very small, say 6 inches or less, the area of such lands which would be required for efficient purification would in certain cases be so great as to render land treatment impracticable. Further information with regard to this point will be available when our investigation of land treatment is completed.

2. After carefully considering, however, the whole of the evidence, together with the results of our own work, we are satisfied that it is practicable to produce by artificial processes alone either from sewage, or from certain mixtures of sewage and trade refuse such, for example, as are met with at Leeds and Manchester, effluents which will not putrefy, which would be classed as good according to ordinary chemical standards, and which might be discharged into a stream without fear of creating a nuisance. We think, therefore, that there are cases in which the Local Government Board would be justified in modifying, under proper safeguards, the present rule as regards the application of sewage to land. No general rule as to what these safeguards should be can be laid down at present, and, indeed, it will probably always be necessary that each case should be considered on its own merits.

3. We consider it of the utmost importance that the simplest possible means should be provided for adequately protecting all our rivers, and we are further of opinion that it will be desirable, probably for some time to come, that scientific experiments should be carried on in order to ascertain all the real dangers of pollution, against which they should be protected. In the present state of knowledge, and especially of bacteriology, it is difficult to estimate these dangers with any accuracy, and it seems quite possible that they should be either exaggerated or undervalued according to the predisposition of those who have to deal with them. An authority guided by medical considerations might not unreasonably be inclined to insist on a degree of purity which may ultimately prove in certain cases to be uncalled for; while another authority, with its mind fixed upon economy, might shrink from taking essential precautions. It is perhaps scarcely for us to say what arrangements should be made, but we are of opinion that the general protection of our rivers is a matter of such grave concern as to demand the creation of a separate commission, or a new department of the Local Government Board, which shall be a supreme rivers authority, dealing with matters relating to rivers and their purification, and which, when appeal is made to them, shall have power to take action in cases where the local authorities have failed to do so.

# ARMOURED FIREPROOF DOORS

To the requirements of the Fire Offices Committee.

Can be fitted with Patent Attachment for Self-closing in case of Fire.

**LIGHTER & CHEAPER THAN IRON DOORS**

Will not Buckle or Twist out of Shape.

The Architect.

THE WEEK.

THE names of the winners of the Grands Prix de Rome in architecture for this year were announced on last Saturday. The first prize was awarded to M. LOUIS JEAN HULOT, a pupil of M. MARCEL LAMBERT. Like so many other architects, M. HULOT is a native of Paris, where he was born on January 21, 1871, and is therefore over thirty years of age. After three or four years in the Villa Médicis, and if he follows the usual routine by accepting an inspectorship on a public building, he will nearly have attained his fortieth year before he starts an independent practice. Many English architects have gained reputation before they reached that age. The second Grand Prix has been gained by M. JACQUES M. PRÉVOST, born in 1874 and a pupil of MM. GUADET ET PAULIN. M. PAUL BARRIAS, a pupil of M. PASCAL, received an honourable mention in the competition. It is needless to say the masters were formerly successful competitors for the Prix. The Grand Prix de Rome in painting has been awarded to M. JACQUOT DEFRANCE, a pupil of MM. BONNAT ET MAIGNAN; M. AZEMA came next. In sculpture the first prize was won by M. BOUCHARD, a pupil of M. BARRIAS; the next winner, M. LARRIVÉ, studies with the same master.

EVER since the Somersetshire Archæological Society have made Taunton Castle their headquarters they have spent considerable sums towards its restoration. The repairs of the great hall have now been completed, and the various portions of the museum are being arranged. In addition to the cost of the renovation of the hall and vestibule, it became necessary this year, on the appointment of a new curator, to execute repairs to the apartments assigned for his residence. Nothing had been done to them, beyond repairs to the roof, for upwards of twenty-five years previously. Towards the total cost of the work at the hall subscriptions to the amount of 705*l.* 6*s.* 6*d.* have been received, including a legacy of 300*l.* The sum expended, added to the other expenditure on the Castle restoration account, leaves a debit balance against that account of 168*l.* 16*s.* Owing to the numerous calls on the purses of the subscribers, it is considered unadvisable to issue any further appeal. A resolution was proposed and carried lately authorising the committee to borrow sums not exceeding 500*l.* at one time upon security of the property of the Society. It was remarked that they had to make the great hall at Taunton into a museum worthy of the county, and the value of their assets in Taunton was 10,000*l.*, so that 500*l.* was a small sum to borrow on that security.

THE present time appears to be unfavourable for many architectural works which are not modern. Last week we mentioned the case of the Garisenda Tower, in Bologna. The basilica of Vicenza, which is partly the work of PALLADIO, is also said to suffer from the weakness of the foundations. From Mr. SOMERS CLARKE'S report it cannot be concealed that for some time past the condition of St. Paul's was enough to excite grave apprehensions of a collapse. The action of the cathedral authorities in commissioning expensive decorations under such circumstances may be an example of hardihood, but it was to be expected that in a city like London more business capacity should be displayed. It would have shown good sense if instead of covering the walls with compositions which nobody can understand and which are not incentives to devotion, an appeal had been made to the public in general for aid to make St. Paul's secure whatever might be the cost. For the safety of so national a work sacrifices would be made, and it would be possible with the assistance of civil engineers to carry out protective measures on the scale that is demanded. Like the Italians, who at Bologna are applying rough-cast as if it were a universal remedy for defects in construction, in St. Paul's cementing on a small scale has been adopted. The aim seems to have been to save appearances, and time has been allowed for a course of

undermining by railways, drains and other enemies. The cost of preservative works on an adequate scale must now, in consequence, be enormous. It might have been foreseen what would be the results of excavations around the cathedral site, but instead of endeavouring to cope with the dangers the authorities have been occupied with the contests of artists, amateurs and clergymen over the character of the various systems of decoration which have been proposed.

THROUGH the aid of Mrs. WILLETT and her family the restoration of Wymondham Abbey, in Norfolk, has been commenced. The building has a history which can now be considered as interesting. In the year 1107 the old Saxon church was pulled down when WILLIAM D'ALBINI founded the Benedictine Priory as a "cell" to the great Abbey of St. Alban, of which his brother was abbot. The new church, dedicated to St. MARY THE VIRGIN, was then built. It was a cruciform structure, with central lantern tower, two towers at the west end, nave, choir, north and south transepts, north and south aisles to the nave, and chapels to the VIRGIN, St. MARGARET, St. ANDREW and another saint. The building was used in common both by monks and parishioners. In the middle of the thirteenth century, in consequence of the monks claiming the whole of the building, the parishioners procured from the Pope an official recognition of the nave and north aisle as belonging to the parish. Later the lantern tower at the intersection of the transepts being decayed, the monks built the present octagon tower, and thus encroached on three bays of the nave. They at the same time laid claim to the whole building. Disturbances ensued, and the parishioners ultimately re-established their right to the remainder of the nave and the north aisle. In the time of Queen ELIZABETH the present clerestory and the roof of the nave were built and the north aisle widened. In 1448 the priory was erected into an abbey, and a few years later the west tower—now almost a ruin—was built and the bells hung. The abbey was dissolved in 1538, and the last abbot was presented to the vicarage. He was buried under an elaborate monument at the south of the altar. In modern times the great church, which is of cathedral-like proportions, has fallen into a very dilapidated state. The restoration will cost from 20,000*l.* to 25,000*l.* The restoration is intended as a memorial of the late Mr. GEORGE WALTER WILLETT, who was for many years a prominent inhabitant of Brighton, and also of the mother of Mrs. WILLETT.

AT Yaverland, in the Isle of Wight, on the shore of the Haven, is a copse known as Centurion Coppice, which formed the subject of some discussion during the recent visit of the Hampshire Field Club. According to VENABLES, it bears in its name a trace of the existence of the chapel of St. Urian, built by the lords of the adjacent manor of Woolverton. OGLANDER says that this Woolverton "had been formerly a good gentleman's estate; now one THOMAS KNYGHT hath it on lease. They had theyre chappell, part whereof I have seen standinge called Centurion's chappell." St. URIAN, or URIANUS, was born in Bretagne in the latter half of the seventh century. In his youth he went to Dol, near St. Malo, or rather Rennes, where he became a priest, and eventually a bishop. In his old age he retired into a monastery, and died in July 749. Traces of foundations still remain in the copse. Evidence is to be found in the Chancery Rolls of its existence in the reign of EDWARD VI. Why was a chapel built in the island dedicated to St. Urian? A conjectural answer is that at the Conquest (1067) Woolverton became the property of a Breton or of a soldier from the South of Normandy. The church of Yaverland, which has many peculiarities, was restored by Mr. EWAN CHRISTIAN some years ago. It is believed that the building originally was not a parish church, but was the private chapel of the RUSSELL family, to whom the manor belonged. There are several parish churches in England which were originally private chapels. There was a tradition, which does not now find much favour, that the building was erected from the remains of another church which stood in St. URIAN'S copse.

POLYLITHIC SCULPTURE.

THE prophecies of BARUCH are among the Apocryphal books. BARUCH, whose name probably conveyed the same meaning as Benedictus, was the faithful scribe of the great prophet JEREMIAH and his fellow sufferer. It is believed he was present at the siege of Jerusalem under the lieutenant of NEBUCHADNEZZAR, and was one of the exiles in Babylon; he therefore lived six centuries before CHRIST. BARUCH, like the majority of the religious Hebrews of his age, was afraid of art, and especially of sculpture. He considered it to be his mission to raise his voice against the statues of wood, gold and silver which were to be seen in the East, and which he thought were employed as idols. He reproaches the other nations with their weakness and blindness, and with that remarkable power of sarcasm which was a characteristic of the Prophets, he mocked the people for the pains which they took in adorning such figures. He declared that serpents used to eat the hearts of their gods, that they were without feet, and had to be carried. In this view we can trace the influence of JEREMIAH, and, indeed, the epistle bears the name of the greater prophet.

The statement is of extreme importance in the history of art, although BARUCH's book may not be accepted by some classes of theologians. It is certainly early evidence, and from its peculiarly Hebraic language it cannot be the composition of a later age. From what the prophet says about the devouring serpents, it is to be assumed that the body of the statue was carved out of wood, and that the gold and silver were either used for parts of the figure, such as the face and the hands, or for its adornment. It is easy to understand that Semitic tribes would think more of the material employed in a statue than of its qualities as a work of art. To meet that weakness the artists may have covered the parts which were visible with precious metals. It is noteworthy that whenever the prophet speaks of an idol he always describes it as if it were a combination of gold, silver and wood. The idols which BARUCH detested were not unique. Among the Greek sculptors of a later time the use of gold and silver with wood was common, and in that way may have originated the golden masks which were employed as late as the Gothic period.

The meaning of the allusion to the absence of feet cannot be explained with certainty. Some of the idols may not have been *selbstständig*, to use a Germanism, and were used solely in processions when they were carried by priests. Figures of the kind were not uncommon in ancient days, but the prophet may also have endeavoured to bring home to the votaries how helpless was the thing they honoured. What is remarkable in BARUCH's diatribes is that he also speaks of drapery as an adjunct of the idols. We know from the Assyrian figures how much importance was attached to beautiful robes by the Asiatic kings and courtiers. We may even conclude the rank of people was expressed by their dress. From various allusions it has been assumed that at a later date draped sculpture was familiar in Greece, and it has been affirmed that a statue of *Venus* which was found at Pompeii must have required for its completion the aid of drapery which could be changed from time to time. From BARUCH's master JEREMIAH we also learn much in a few lines about the character of the idols. We are informed how they were cut out of a tree of the forest, they were decked with silver and with gold, they were fastened with nails, they must needs be borne because they could not go. Then it is said, "Silver spread into plates is brought from Tarshish and gold from Uphaz, the work of the workmen and of the hands of the founder; blue and purple is their clothing; they are all the work of cunning men." It is not stated that blue and purple textiles were used, but we may conclude from the words of the two prophets that was the practice in the East 2,500 years ago.

The best Greek works are undoubtedly in white marble, but JOHN GIBSON was not the only expert who believed that the figures were coloured or delicately tinted. There was a love of colour among the Greeks as among the Easterns, and they were prepared to make sacrifices in order to gratify their eyes. Besides, the mythology of the Greeks was represented by a great number of figures, and, although the artists may have adhered to certain types to make apparent what deity was before a spectator, the use of ornaments as auxiliaries for that purpose was, therefore,

recognised as legitimate. Gold and silver were best adapted to express whatever was symbolic.

There is accordingly sufficient evidence that besides the chryselephantine statues and the tinted statues, there was an older class made up of several materials. It was likely to occur to such keen logicians as the Greeks that robes, which were not enduring were not adapted for statues, which would depend for much of their interest on their age. For the same reason gold and silver, which were temptations to thieves, were undesirable. Whatever the cause, we know that statues made up of more than one kind of marble were prepared, Greece was rich in marbles, and it was possible to obtain materials that would be suggestive of others of a different class. Not only gold and silver, but draperies could therefore be imitated with sufficient accuracy and without much expenditure of money. A yellow marble was to be found in Corinth, Melos and Macedonia which served for gold; there was a black marble in Miletus which recalled ebony; the purple robes could be represented by Lydian marble, and so on. With men of taste the figures of coloured marbles were not acceptable, but the vulgar rich patronised them, and on that account it appears they were mentioned by MENANDER as one of the accompaniments of luxury. The multi-coloured arrangement was not confined to marbles. Bronze heads, feet and hands were employed with marble figures, and sometimes there was a reverse practice, and to figures in bronze, extremities in marble were added. VITRUVIUS in his second book calls such statues *akrolithoi*. It is possible that when occasion demanded heads were changed, and a man who wished to be agreeable to his guests would require to be possessed of a stock of portraits of their favourites. Some toy-books for children which were in use in the early part of the last century included a number of heads that could be added to one body, and were possibly a survival of the Greco-Roman sculptor's practice.

Sometimes the employment of different materials was more delicately carried out. According to PAUSANIAS there were bronze statues in the city of Clœtas in which the nails only were of silver. There was more naturalness perhaps in using an exquisite marble or precious stones to express the eyes, which was a common practice. It would appear that in the Roman studios there were specialists who were called in for that class of work, and instead of being described as a sculptor the man became a *faber oculus*.

Neither BARUCH nor JEREMIAH mention the existence of marble idols, unless they are comprised under the generic term stone. It is possible they were not present at that time in many parts of the East. According to PLINY the use of marble was known to Greek sculptors about the year 580 B.C. BARUCH was probably then living, but it was not likely that he took any concern in the progress of art in Greece. No doubt the early figures of stone or marble were stiff in their attitudes, but much of that quality would be lost if drapery were introduced.

It cannot be said that the use of coloured marbles in sculpture has ever died out. Composite figures were pleasing to Roman amateurs. From time to time examples are met with which show that the arrangement continued to find favour as time went on. During the later Renaissance many examples were produced, and they were more in keeping with the unrestrained luxury in furniture and decoration to be found in the interior of palaces. Occasionally instances are still to be seen in auction-rooms, and there is probably not one of the principal London dealers in bric-à-brac who would not be able to produce large busts or terminal figures which are formed of different coloured marbles with or without bronze. The class of art may be condemned, but it has antiquity in its favour, and it is not without alliance with various other classes of art. It provokes also a comparison with painting, and as an element in decoration it might occasionally be turned to account.

Marble pictures which differ from mosaic by the avoidance of any particular form of tesserae were also in favour as a wall decoration. In a church at Antwerp, of which RUBENS was to some extent the architect and superintendent of decoration, they were tolerated by him, although with his own hand he could fill the spaces occupied by them in a fraction of the time devoted to cutting out the fragments from marble. But the great

Fleming could be generous, and wished to give a helping hand to artists in other materials besides paints and canvas.

THE BRITISH MUSEUM.

ONCE a year, as our columns testify, there is in many English counties a revival of interest in archæology. It is not to be supposed that all who assist at the meetings, or share the waggonettes in excursions, are able to contribute to the extension of knowledge on the subject. The majority will generally be found to be inspired by a desire for entertainment of a class which is obtainable under no other conditions. But a great deal of enjoyment is derived, and it is possible that old buildings and other relics of antiquity are afterwards remembered with more reverence. What was before thought no more than rubbish may be discovered to possess the claims on attention which should belong to survivals of the past. Even a slight amount of enthusiasm may often be sufficient to preserve a building and to keep out of the melting-pot a piece of silversmith's work which used to be looked upon as an auxiliary to superstition. Everyone knows how much has been sacrificed in this country through a want of appreciation of objects which have a history; and those who may consider that the present is inferior to the past in respect to its productions have reason to be grateful to local archæological societies for the educational work they have accomplished.

In case it should be assumed that England is too circumscribed to be worthy of the undivided attention of an archæologist we generally have a report of the British Museum appearing about the time when the county excursions are undertaken, which will suggest the additions which have been made to treasures which as revelations of preceding ages may be said to be unrivalled. A study of the contents of the Museum cannot be accompanied in every case by the pleasures which await those who belong to local archæological societies; but, with all the drawbacks, it is satisfactory to know that during the past year 663,724 visitors passed through the portals of SMIRKE'S building. Many of them would perhaps hesitate to acknowledge they were archæologists, but it cannot be denied that the object of the Bloomsbury collections is to be suggestive of the past rather than of the present, and the crowning attractions are derived from antiquity. The Trustees have endeavoured to enable visitors to see the objects with less difficulty, for by the introduction of skylights in several galleries the contents of the cases are less obscure on dull days.

For architects the most interesting acquisition will be found in the remaining drawings of ancient buildings which were made in all parts of England and Wales by JOHN CHESSELL BUCKLER and members of his family during three generations. The purchase of the collection has been spread over three years. The drawings fill nearly 100 volumes. Many of the edifices no longer exist, and others have been so transformed as to be now recognised with difficulty; but as the BUCKLERS were remarkable for the painstaking accuracy of their representations, the value of the record is inestimable. The diaries of GEORGE SCHARF, the elder, in Lycia during the years 1839-44 will also be found useful in connection with the exploration of Sir CHARLES FELLOWES, by which the Museum was enriched with an interesting collection. Remains of architecture are not easily obtained, but some marble slabs and fragments have been brought from Naucratis and from the tomb of AGAMEMNON at Mycenæ. Another acquisition is a cast of pillar inscribed with *boustrophedon* inscription in archaic Greek and Latin characters having reference to sacred rites. The original was found *in situ* in the Roman Forum under the black marble pavement, and beside two oblong bases, apparently of the two lions which, according to Roman tradition, were beside the tomb of ROMULUS or of FAUSTULUS.

All keepers of museums know that objects and works which are incomplete may be expected to be one day furnished with the absent fragments. For instance, there was a portion of a bar of gold in the Museum which was supposed to have been used as a medium of exchange, but another fragment has been purchased, and it is now found that the total weight is 1,113 grs., or about eight and a half times

the Mycenæan unit of 130 grs. Of humbler interest, but an object that will appeal to a larger number, is a bronze writing pen of the Roman period, one end fashioned like a modern nib, not split, but with a groove down the centre; the other end is shaped like a small spoon for erasures.

Greece and Rome are modern compared with Egypt and Assyria. Mummies have become almost too numerous, but those derived from a predynastic cemetery in Upper Egypt are unlike the generality of examples. They were found in shallow oval graves hewn in the rock. They are representatives of a fair-haired, light-skinned race, which appears to have been descended from the aboriginal inhabitants of the Nile valley.

A collection of scarabs represents a period from B.C. 3600 to B.C. 600. Among other additions are five baked terra-cotta models of Egyptian houses of the dynastic early period. It is too often believed that the arts in Egypt were under such rigorous hieratic control, individuality was not tolerated. The white limestone stele of MERI-HERU refutes this tradition, for it is signed by the sculptor REN-SENE. The Assyrian collection has been increased by 1,360 tablets from Lower Babylonia. They include a number of interesting commercial documents and contract-tablets which were inscribed during the periods of the rule of the kings of the second dynasty of UR, about B.C. 2400, and of the kings of the first dynasty of Babylon from about B.C. 2300 to B.C. 2050, as well as several valuable documents which date from the reigns of CAMBYSES and DARIUS THE GREAT, B.C. 529 to B.C. 485, with black basalt gate-socket of ENTEMENA, governor of Shirpurla, about B.C. 4500, inscribed in "line-Babylonian" with the king's name and titles, and with an account of the temples which he built during his reign; and a baked clay cone of GUDEA, governor of Shirpurla about B.C. 2500, recording the building of a temple in honour of the god NINGIRSU.

The purchase by the Trustees of the gold ornaments found in Ulster has been interpreted as an addition to the many wrongs endured by Irishmen. Jewellers' work from Wales has been obtained, and we may be assured there will be no outcry by the Welsh members at the insult offered to the Principality. At Rhayader, in Radnorshire, were found a broad gold bracelet ornamented with applied wires, with enamelled clasps displaying Celtic scrollwork, an incomplete pair of gold bracelets in quadrangular panels set with garnets and sapphire pastes, and a heavy gold ring set with an onyx intaglio of an ant. At Sully Moor, near Cardiff, four gold rings, with ornamented angular shoulders, one set with a cameo and another having a cock engraved on the bezel, were discovered. From some Roman coins found with them the date of the rings appears to be about A.D. 300. The most valuable acquisition is, however, a massive triple collar of gold, with engraved geometrical ornament and cup-shaped projections, found at Penha Verde, near Cintra, Portugal. This important addition to the prehistoric series in the Museum is probably the most remarkable relic of Bronze Age metal-work found in Portugal.

The Department of Coins and Medals has been enriched by 1,311 examples, of which 54 are gold, 491 silver, 704 bronze, and 62 other metals. Some are rare, and there are fine examples among those from Greece. One from Eumania, in Phrygia, suggests the historic importance of coins. The late M. WADDINGTON, the French statesman, was no less distinguished as a numismatist. In one of his works he came to the conclusion that the city of Eumania was for a time known as Fulvia, as a complement to the first wife of MARK ANTONY. The coin obtained for the Museum confirms the hypothesis, as from the inscription it is evident the name of the "shrill-tongued FULVIA" was obliterated from the dies and the old name of the city restored.

Among the printed books now is a copy printed in Paris in 1483 of BOCCACCIO'S "Ruine des Nobles Hommes et Femmes," one of the earliest illustrated books printed in France. The woodcut blocks used in this work were sold to RICHARD PYNSON, and were employed by him to illustrate LYDGATE'S translation into English of BOCCACCIO'S work printed in 1494 under the title of "The Fall of Princes." The British Museum possesses two imperfect copies of this translation, one of which wants all the leaves containing the woodcuts, while the other wants three of the nine which

should exist in a perfect copy. One of the two earliest guide-books printed describes Pozzuoli, and has been secured. The most important donation is the library of the late Mr. H. S. ASHBEE, containing 8,764 works in 15,299 volumes. These include a collection of books by or relating to CERVANTES, consisting of 384 editions of "Don Quixote," 114 editions of the other works of CERVANTES, and 252 books relating to his life and works. Other important portions of this library consist of large collections of the works of FIELDING, STERNE, MOLIÈRE and LE SAGE, and of an interleaved and extra illustrated copy of NICHOLS'S "Literary Anecdotes," extended to 42 volumes. For lovers of the theatre the Hon. SIDNEY CARR GLYN'S gift of a collection of play-bills of Covent Garden Theatre, 1791-1880; Theatre Royal, Haymarket, 1805-79; Lyceum Theatre, 1809-91; the King's Theatre, afterwards Her Majesty's Opera House, 1808-48; Royal Kent Theatre, Kensington, 1834-46, and of other London theatres and places of amusement will be of more importance than the Assyrian deeds of baked clay.

The Department of Prints and Drawings has acquired 11,133 works of various classes. Among them are 53 designs by JOHN FLAXMAN and 210 by STOTHARD. No less than 493 platinotype photographs of ancient buildings in various parts of the United Kingdom, executed for the National Photographic Survey and Record, have been presented.

EXPLORATION OF RUINS IN ZAMBESIA.

IN a letter to the *Times* Dr. Carl Peters writes:—I have been exploring in the last two years the country between Zambesi and Sabi, and have been able to ascertain that all the ancient ruins along the eastern border of Mashonaland apparently belong to the same class of civilisation. Along the banks of the Mazoe and Ruenya, on the high plateaux of Inyanga and Melssetter, in Manicaland, and in the neighbourhood of the Sabi river I have everywhere found the same type of ruins. Over the whole district the cyclopean wall is the typical form of house-building, and in some parts whole cities of these buildings are lying open to the eye of the astonished explorer. In north Inyanga I found debris of ancient settlements with a diameter of 1½-2 miles. All over that country artificial water-furrows are still existent. You know the book of the late Theodore Bent, "The Ruined Cities of Mashonaland," in which he describes some of the ruins in the southern parts of the zone very correctly. It is much to be regretted that this excellent explorer has died so soon. His theory on the character of Zimbabwe and other ruins is undoubtedly quite correct. The symbols of phallus-worship can be found from the Zambesi down to the Sabi, and there can be no doubt that the old race which has lived here formerly, and which has left those ruins, adhered to the cult of Baal and Astarte. Bent is also right when he points out that most of those ancient fortifications were built in connection with mining business. Not only are all old workings on gold mines generally found in the neighbourhood of those ruins, but I have also discovered in this summer a series of ancient copper mines along the eastern bank of the upper Sabi. I followed up these copper workings to an extent of about 20 miles, but I am certain that their extension is a much larger one towards north and south, and I have been informed by the natives that similar workings exist also on the western bank of the Sabi river.

All these facts, which I was able to ascertain through my explorations, lead me to believe that the ancient conquerors belonged to a Semitic race, and the repeated appearance of the name of Massapa, Umsapa, Rusapi, Sabi, &c., makes it highly probable that they were Sabæans, a race very nearly related to the Phœnicians of the Mediterranean. We have found in Manicaland two stones with old inscriptions, which I have not been able to decipher yet and which I expect presently in London. They seem to me also in old Semitic characters.

Thus far my explorations confirm more or less the opinions put forward by other explorers before.

Now I think I am able to go a step further with my conclusions on the basis of new evidence which I have got.

Livingstone in his last diary already leads attention to the strange fact that a tribe on the Rovuma river showed tattoos of a decidedly Egyptian character. I have also wondered how it came that the Egyptian prefix "Sa," meaning "land," appears in the name of "Sofala," which was originally "Sa-Ophara," or "Ophirland." During my last expedition I had a chance to get access to some newly-discovered bushmen-paintings, which are in form and in colour of an absolutely Egyptian character. It is also known that etymologists have found in the Hottentot language traces of the ancient Egyptian.

These all are very remarkable facts, which seemed to contradict the Semitic-Sabæan theory of ancient South African civilisation. I am obliged to the chief of the police in Umtali for further and much more important evidence in this direction. I have brought with me a female, undoubtedly Egyptian, figure of 4½ inches length, which is splendidly conserved. This figure was found about 17 degs. south and 33 degs. east, south of the Zambesi river. It has hieroglyphics round its waist, which have not been deciphered yet. I take it that this figure is about 5,000 years old, and a representation of the goddess Isis. This now is a most remarkable fact, for it is quite clear that the statuette cannot have come overland from the Nile to the Zambesi river. In connection with the other evidence I have mentioned it proves direct Egyptian influence in South Africa.

Now you know that besides the "Ophir" question the mysterious country "Punt" or "Phoun" has excited for centuries the curiosity of scholars. This country "Punt" or "Phoun" is mentioned in ancient Egyptian representations:—"And Sanch Kara of the ninth dynasty, about 2500 B.C., and the Queen Hatsepu, of the eighteenth dynasty, about 1600 B.C., sent expeditions thither. They brought back gold, ivory, several kinds of valuable timber, leopard skins and two kinds of monkeys, among them baboons, too. The interpretation of the word Punt is just as much disputed as that of Ophir; but, judging from the above-mentioned products, it is probable that under Punt an African country has to be understood" (see Dr. Carl Peters, "King Solomon's Golden Ophir," pages 77, 78), and as the products of the "Punt" expeditions are more or less identical with the returns of the "Ophir" voyages, scholars as Carl Ritter have already concluded that "Ophir" and "Punt" were the same country.

The country between Zambesi and Sabi in South Africa, I take it, is the "Ophir" of Solomon's epoch. I believe that the finds of my last expedition bring some evidence that "Punt" was indeed the same country.

I believe that these mining districts were originally discovered by the Egyptians, and were an Egyptian colony; that the Phœnician epoch, of which many more relics are existent, probably followed the Egyptian, in fact, that the Phœnicians took the country some time between 1600 B.C. (Queen Hatsepu's expedition) and 1100 B.C. (King David's period).

Since then Arab influence has been predominant in these parts of the world, till the Portuguese conquistadores under Vasco de Gama appeared.

I intend to lay all my evidence presently before the public.

THE SECURITY OF ST. PAUL'S CATHEDRAL.

THE following official statement concerning the condition of St. Paul's has appeared in the *Times* from Mr. Somers Clarke:—

Many reports have been circulated about the security of St. Paul's Cathedral which are not more remarkable for their conflicting nature than for their lack of authority. The public have been alarmed by statements about serious cracks in the fabric. These there are. They, expecting to see daylight shining through the walls, go away disappointed. Then we see comforting reports that there is really no cause for anxiety.

The expectations of the one set of people are as unreasonable as the other reports are untrue.

Never having seen any representative of the Press, information that has been attributed to me is wholly imaginary.

It has been thought well that I should ask permission in your columns to make a statement as to what is the real condition of things, and this I will try to do as briefly as possible.

Within the first hundred years after the structure of the cathedral was finished the immense weight resting on the foundations of the eight piers which carry the dome and on the foundations of its abutments caused those parts of the structure to sink a little.

Most ingeniously spread out as are these foundations so as to cover the largest possible area, the earth beneath them has consolidated rather more than under those parts of the fabric less heavily loaded.

The settlement thus caused has broken the eight arches and the windows of the clerestory over them in the nave, the choir and the north and south transepts, where they abut on the dome piers.

In the same way the very great weight of the western towers has caused them to sink. In sinking they have cracked the west front in a vertical direction through the great door, the window above and the vaulted ceiling of the portico. They have also cracked through the wall of the chapel to the east.

It is very rarely that one finds one of our cathedrals with towers or other heavy features wherein such parts have not been a cause of settlement.

Such settlements are not necessarily a cause of serious insecurity, but it is obvious that by them the integrity of the

edifice is more or less destroyed. Where the structure was intended to be tied together by continuous masonry the continuity is broken. Arches which should exercise their pressure in a definite direction begin to act in directions unforeseen.

In buildings of Pointed architecture such deformations are less serious in result than in those where round arches only are made use of. Pointed arches will undergo the most extraordinary distortions before they finally yield. The moment a round arch is broken or begins to spread the top flattens and its strength is jeopardised.

Above a hundred years since the development of the before-mentioned settlements gave cause for anxiety a system of great iron ties was introduced into St. Paul's Cathedral. These are placed so as to tie back to the dome piers the fronts of the north and south transepts; to counteract, in fact, the want of continuity caused by the breaking through of the arches and window already referred to.

But another movement was also observed, and ties were introduced to counteract it. The transept fronts were found to be settling away from the main fabric, and also themselves to be settling towards the east and west, this being demonstrated by a crack extending vertically through the windows.

The damage in the south transept was greater than in the north, and has since developed. This we can tell by observing the size of the joints between the stones, many of which, after the fashion of the time, were run in with lead, now quite loose and not filling the joints.

Wren was well aware that the substratum on which the cathedral was to rest left much to be desired.

The Mediæval builders as a rule troubled themselves very little about foundations. Wren took all precautions that were known or practicable in his time.

Examining the site of his new cathedral, he found that, passing through the debris of old London, he came, at a depth of some 15 feet or 16 feet from the surface, to a layer of clay, or "pot earth," as he terms it. This varied from 6 feet to 4 feet in thickness. The pot earth rests on a stratum of sand (not at all solid) mixed with gravel stones, the lower part wet. Below this, and some 35 feet to 40 feet from the surface, lies the London clay. Wren thought it out of the question to carry all his foundations down to the London clay. He rejected piles, foreseeing that wells or other things might more or less drain off the water from over the clay, and knowing that, unless piles remain always under the same conditions, they must certainly rot. He thought best, by spreading the foundations, to float the cathedral on the bed of "pot earth," and thus he built, never dreaming of the desperate attacks the sandy substratum under the pot earth would have to sustain. Had this substratum been left undisturbed, although there would no doubt have been some movement on the structure on the lines of the chief settlement we now see, there is no reason to apprehend that the movement would have continued.

The very necessary increase of sanitation and of road improvement was probably the first serious attack on the substratum.

The ground on which the cathedral stands slopes rapidly towards the south and the west. It is fairly level to the east and north. In all directions sewers were made and at various depths.

It was proposed in 1832 to bring a sewer at some 30 feet below the surface through the churchyard on the south and east sides of the cathedral. Immediately the danger to the fabric that this would cause was pointed out, the Corporation of London, which has ever shown the greatest consideration for the cathedral, ordered the works to be stopped. The deep drain in these places has never been made. Unfortunately it was carried up Godliman Street almost into the churchyard, and must have done not a little to drain the substratum, especially near the south-west tower. The level of this sewer is considerably below the bottom of the foundation of the cathedral walls.

Some thirty years ago the Metropolitan District Railway was made under Queen Victoria Street, cutting a large gash along the southern slope of the hill on which the cathedral stands.

The railway at its nearest point is but 530 feet away; that is, just about the length of the cathedral. The railway is, in fact, a huge trench cutting into the sandy stratum. The disturbance caused by making such a trench was very great. There cannot fail to have been a considerable change in the water-bearing conditions just above the London clay. A cutting once made the water will always follow it.

Below the underground railway there has since been pierced the tube for the Waterloo and City Railway. How far this is down in the London clay I do not know.

We find, then, that the southern slope of the hill on which the cathedral stands is fairly riddled with excavations of one sort and another. There are sewers, the underground railway, and a tube at a lower level.

The most remote of the railways or tubes is but just 530 feet from the cathedral foundations.

Those who have studied earth movements, the result of deep excavations, know that a great deal of dislocation takes place in a line diagonally right and left of the parts excavated. The fact that the underground railway is 500 feet off does not insure that resultant earth movements do not come much nearer to the cathedral. During the last twenty years fresh indications of settlements have been showing themselves in the walls of the church. The movements are still in progress.

Those most to be observed are on the south side. The worst are in the south transept. The way in which these have moved since the ties of 100 years ago were inserted shows that the settlements are due not to the thrusting of arches in the fabric itself, but to the subsidence of the mass which at this place consists of a wall from 8 feet to 10 feet thick, 130 feet long, 130 feet high, and weighs between 12,000 and 13,000 tons.

The arch of the window head is so broken that the great keystone carved with a cherub had dropped more than 2 inches from its place. Before the repairs just completed it was quite loose, and was merely held by the pinch of some stones at the back and by the ironwork of the window. The wall has, in fact, split vertically through the doorway and window over it, sinking gently in two masses right and left.

The coffered window head we see from inside the church is quite out of shape, and the same dislocation in a less degree may be observed over the windows of the clerestory adjoining. The massive iron stanchions intended merely to resist the wind and to give rigidity to the lead glazing are now bent by the weight of the window arches pressing upon them.

It would be going into too much technical detail to state in your columns where there are other indications of movement. It is enough to say that they exist on the south side of the church, and we know that some of them have continued to develop during the last three years. They are still developing.

If we suppose it possible that the subsoil be left from henceforward untouched, the settlements are of sufficient importance to make it necessary not only to watch them carefully, but to expend considerable sums (out of a very limited income) on their repair. During the last four years the Chapter has had to find the money for such works.

But now comes the attack by the electric railways. One of these—the Victoria, City and Southern Electric Railway—proposes to come under the churchyard, taking a line between the cathedral and the great warehouses on the south. The centre line of the tube or tunnel would be about 40 feet from the south-west tower and 50 feet to 60 feet from the south transept.

Another—the Piccadilly and City Railway—proposes to pass under Carter Lane—that is to say, under the first street immediately south of St. Paul's Churchyard.

The centre line of this tunnel is at a distance of 170 feet both from the south-west tower and the south transept. It would be a little nearer to the cathedral than the width of the west front. It would be but 300 feet from the centre of the dome.

We must not forget that the cathedral is already attacked on the north. Here is the tube of the Central London Railway, and this is but 460 feet from the centre of the dome.

We know that this tunnel, passing as it does close to Bow Church, has already in the few short years since it was pierced caused the steeple to overhang 1 foot 9 inches towards itself. Bow Church tower is a mere toy compared with the enormous weight of St. Paul's. The area of one of the western towers of St. Paul's is just double the area of Bow Church tower.

But, sir, the chief danger to the cathedral lies by no means only in piercing the tubes or in the vibration from passing trains. The tubes may be sunk ever so far down, the vibration may, and no doubt will be very much reduced, but wherever the tube may be a tremendous hole must be made for the public to get at it. Then when the bottom is reached there are footways, cross passages and all manner of subsidiary excavations. Who knows what underground streams may not be tapped in making these big shafts, or how much superincumbent weight may affect excavations?

The Piccadilly and City Railway proposes to place its terminus under the space where Cannon Street is crossed by Queen Victoria Street. The tunnels in which is the terminus must necessarily be of considerable length, and can hardly fail to come within 600 feet of the cathedral.

The great hole and excavations to the east are, however, not more dangerous than would be those to the west on the slope of Ludgate Hill, where a station is projected. There is already, on the north, the Post Office station of the Central London Railway.

The results of these big excavations and disturbances would very probably not show themselves seriously in the fabric of the cathedral for a good many years; but what is, let us say, 50 years in the life of a great national monument, one of the most magnificent buildings in the world, and which, taken due care of, may last for 1,000 years and more?

CAMBRIAN ARCHÆOLOGICAL ASSOCIATION.

THE fifty-fifth annual meeting of the Cambrian Archæological Association was held at Newtown, Montgomeryshire, on the 30th ult., when the presidential address was given by Lieutenant-Colonel E. Pryce-Jones, M.P., who in the course of an interesting paper said it was not his intention to enlarge upon any of the details that would come before their notice during the week's excursions, but he would like to say a few words upon two or three general questions which appeared to have a close connection with the work of the Association. These points were:—(1) The protection and better preservation of our national monuments; (2) the formation and the establishment of local and national museums; and (3) the collection and publication of local and county records. It was hardly necessary to dwell at any length upon the need for, and the importance of protecting and preserving the ancient relics and monuments which the hands of the Goth and the ravages of time have still left to us. But the days had not yet come when a warning on this score could be deemed unnecessary, for he was afraid that it was still within the bounds of possibility for meinhirion and even crosses to be broken up and to be built into walls, and for inscribed pillar stones to be utilised as gate posts or lintels or even pig troughs. Civilised communities had learnt to recognise the value of the accumulated knowledge which might be derived from the monuments of the past, but the careless and the thoughtless could at any moment destroy for ever a possible source of invaluable information, and the utilitarian material mind was apt to think more of a standing shed than of a broken ruin. To those who had a responsibility in the matter of preserving our ancient monuments, be they stone crosses or dolmens, or the remains of ruined buildings, he would commend the good advice tendered by a distinguished member of this Association—Mr. Romilly Allen—in a paper which he read before a kindred society some few seasons ago, viz. that they should take advantage of the Bill passed for the Preservation of Ancient Monuments, the provisions of which enable any owner of a monument by deed of hand to constitute the Commissioner of Works its guardian, while relinquishing no right which he previously possessed with regard to the monument itself, except that of being able to destroy it. The Commissioner of Works, he understood, undertook in these circumstances to maintain the monument at the expense of the Government. Local archæological societies and the local authorities could do much to stimulate public interest in this matter, and he trusted that Montgomeryshire would not be behindhand in carrying out so obvious a duty. The second point which he desired to mention was the desirability of encouraging the formation and establishment of local and national museums. For reasons that were by no means clear or conclusive, the Government up to the present had not looked with a kindly eye upon the indubitable claim of Wales to a share of the public money that was devoted to the maintenance of museums. It behoved the community to act in such a manner that the Government must eventually be shamed into doing what was right and just in the matter. Looking at the position from a practical point of view, the suggestion nearest to hand was that museums and art galleries should be established in connection with the National Colleges. In the time to come they might perhaps have so far composed the local contentions as to be able to decide harmoniously and unitedly on the most suitable place for what may be termed the National Museum for Wales—a museum which in its comprehensive arrangement and educational possibilities would fully represent the continued development and progress of the country. In the meantime incalculable good could be effected by establishing and fostering local museums, which would serve not only as a storehouse where they might rightly preserve precious treasures, but form also an educative agency appealing not only to the awakening intelligence of their youth, but to the wider range of thought and ability amongst our scholars and experts. As a Montgomeryshire man, he was glad to feel that in that respect also they of that county could hold their own, for in the Powysland Museum and Gallery of Art at Welshpool they had a local collection that was, he believed, second to none in the Principality, both as regarded its objects and its contents. Finally, he desired to say one word as to the need for collecting and publishing local and county records. In that matter Montgomeryshire could claim that it had led the way, for, apart from the many valuable papers concerning the county and its antiquities which were to be found in the pages of the "Archæologia Cambrensis," they had in their Powysland magazine a collection of local and other records that would make the task of the county historian, when he appeared, comparatively light. Other counties in Wales should follow so excellent an example, for the time had come when the few county histories which they possessed, such as Meyrick's "Cardiganshire" and Jones's "Brecknockshire," all required to be rewritten in the light of fuller information and brought up to date. As an example of what could be done with early county records, he need only refer to a work recently carried

out by one of the members of their own committee, viz. the Calendar of the Quarter Sessions Papers of the county of Worcester, compiled by Mr. Willis Bund. By means of that most admirable compilation Mr. Bund had succeeded not only in showing the importance of the documents with which he dealt, but in throwing a flood of light on the daily life of the people of this county two and three centuries ago. Work of a similar kind was urgently needed in connection with documents relating to Wales, both locally and in the public depositories, and he earnestly commended it to the attention of the members of the Cambrian Archæological Association.

TESSERÆ.**Roman Britain.**

THE same style and taste in art and that love of convenience, comfort and splendour that was found in the chief provinces of Italy and Gaul, which fell short only of imperial Rome itself, pervaded the palaces of the Roman generals and the British chieftains—their coadjutors and allies; and Roman luxuries in architecture, such as hot, cold and vapour baths, with gymnasia, hippodromes, theatres and amphitheatres were to be found, as their ruins testify, in every Romano-British city or station in the island. Britain abounded at this time with well-built villages, towns, forts and fortified stations; and the whole country was defended by that high and strong wall, with its numerous towers and intervening castles, which reached from the mouth of the river Tyne on the east to the Solway Firth on the west. This spirit of improvement that distinguished every spot whereon the Romans formed a settlement, so much advanced the taste and increased the number of British artists and artificers that in the third century this island was celebrated for artistical knowledge. When Constantius, the father of Constantine the Great, was about to rebuild the city of Autun, in Gaul, in the year of Christ 296, being well acquainted with Britain, of which country his wife Helena was a native, he procured the ablest of his workmen from there, which, according to Eusebius, greatly abounded with the best artificers. After the abandonment of Britain by the Romans—whose attention was called by insurrections against their imperial authority in states nearer home to think much of this distant colony, which had been severely ravaged by the Picts and Scots—the classical taste in architecture gradually declined, and was succeeded by various, and in some instances depraved, styles. The country, although divested of Roman armies, had been thoroughly Romanised by the enlightened conquerors, and if no Roman general or person of inferior rank remained behind, the Britons who had been entrusted with command had become half Romans by education.

Modern Medals.

All coins preceding the ninth century or age of Charlemagne are denominated ancient; all posterior to that period down to the present time modern. Pinkerton, in his valuable "Essay on Medals," observes of the latter that down to the revival of learning in the sixteenth century "they are so very rude that curiosity alone suggests any inducement to examine them. Without dates or epochs they cannot serve one purpose of utility. The very portraits found on them are so uncouth that the 'human face divine' is scarcely discernible; the reverses always bear a most beautiful cross, garnished with pellets, or a dish of some such exquisite flavour." The most observable difference in respect of art between modern and the ancient medals seems to lie in the portraits. The ancient artists even of the lowest class marked the character and exhibited the life and spirit of the person represented, while the moderns only produce a kind of model with very faint features of the character. The ornaments of the portraits have also this effect, the ancient being simple and picturesque in real life, whereas ours are discordant and ungraceful. The reverses of ancient medals when consisting of human figures or detached objects exceed the modern in every view of strength, elegance or taste. But in landscape and all belonging to perspective the modern excel the ancient to a prodigious degree. A great fault of modern reverses as of modern portraits is that the manners of the time and country are often wholly perverted in them. Personifications are of all ages, countries and languages, but what title have heathen gods and goddesses to exist on our medals and attract the adoration of our connoisseurs?

The Laws of Beauty.

That laws of truthfulness and reality are essential to the production of beauty in all works of art is certain—so essential that without them all attempts at beautiful effect must utterly fail. Still, it is not to them that beauty owes its existence. Combined with good taste they may save us from ugliness, but they will not necessarily produce beauty. There are many works of art of which we say that they are really beautiful. They contain elements of beauty which cannot be mistaken. There

are other works of which we say that they are all very well; they answer their purpose, but we see no real beauty in them. Again, there are other works of which we say that they are positively ugly. It is from this ugliness that these constructional laws may save us, and if the mind of the artist is imbued with some of the spirit of ancient art, he will often produce forms that do contain elements of real beauty, but this is all. It is scientific research alone into the nature and causes of beauty and perfection that can enable even the greatest artists to produce works of the truthfulness of whose proportions they can be at all certain. The deeper our researches are into the principles and causes of beauty in architectural form the better able we shall be to produce beautiful effects, and the more we shall appreciate the beauty which, all confess, is found in the works of antiquity, whereas the deepest research into the laws upon which the mere material and constructional element is framed will not help in the attainment of positive beauty.

The Colonnade.

Colonnades are of various forms and dimensions, and assume different names according to their application and uses. When in front of a building or in the interior of a quadrangle they are called porticoes; when surrounding a building of any shape, peristyles; when double or more, as in some of the ancient temples, and the circular peristyle in front of St. Peter's at Rome, they are polystyle. No people have made more use of colonnades, or with greater effect, than the ancient Egyptians, many of their temples being literally thickset, both in the interior and exterior, with colonnades of every description. The Greeks were more simple in their arrangement, and their colonnades were mostly distributed into porticoes and peristyles, both monostyle and polystyle. Their most magnificent example is perhaps the Temple of Jupiter Olympius at Athens. Baalbec and Palmyra present also various examples of splendid colonnades. Of modern works, the magnificent colonnade of the Piazza di San Pietro at Rome, the work of Bernini, is at once the grandest and most beautiful. It consists of 280 columns, and 48 pilasters of 40 feet high, raised on three lofty steps. It is surmounted by a balustrade, on which are 88 colossal statues of saints 15 feet in stature. Colonnades are among the most beautiful and splendid works of architecture, and in the hands of a man of taste and science are capable of the grandest and most imposing effects.

The Pyramids.

The ancient Egyptians seem to have penetrated very far into the mysteries of nature, and although their superstition appears at first sight to be extremely gross and absurd, yet it is very probable that their deities were only emblematical personages, representing by sensible images the grand effects or presiding principles which they supposed to exist in the universe. Thus the moon was called Isis, and the sun Osiris, and to the honour of this last deity, from whose visible influence and creative energy all things seem to spring into existence, it is not improbable that the Egyptians erected those stupendous monuments and dedicated them to him as temples or altars. It was natural to build them in that shape which the rays of the sun display when discovered to the eye, and which they observed to be the same in terrestrial flame, because the circumstance was combined in their imaginations with the attribute which they adored. If they were temples dedicated to the sun, it seems a natural consequence that they should likewise be places of sepulture for kings and illustrious men, as the space which they covered would be considered consecrated ground. This hypothesis is common, and is not contradicted by the present reasoning. But considering them as altars, and as most travellers agree that they were never finished, but terminate in a square horizontal surface, it would not be refining too much to venture an assertion that in great and solemn acts of adoration the Egyptians constructed fires, the flames of which should terminate in the vertex of the pyramid, and so complete that emanation of their deity which they admired and adored.

The Maesta, Siena Cathedral.

The greatest effort in the career of Duccio di Buoninsegna was the famous Maesta for the high altar of the cathedral of Siena. It consisted of many parts united as one great panel, 14 feet long by 7 feet in height, exclusive of the pinnacles, and painted on both sides. On the front was the Madonna enthroned, holding on her left knee the infant Saviour, who was fully clad, after the Byzantine manner. Twenty angels surrounded the throne. Figures of the Apostles and of four kneeling bishops, tutelaries of Siena, completed this side of the altar-piece. On the reverse, which faced the chancel, various scenes of the Life and Passion of Christ were depicted in twenty-six small compositions, of which two, the Entry into Jerusalem and the Crucifixion, exceeded the rest in size. There was, further, a predella containing many subjects from the lives of Christ and the Virgin. This important work was commissioned in October, 1308, and was not wholly finished till about three years later; although on June 9, 1310, what we must suppose

to have been the front panel only was carried to the Duomo with solemn pomp, in which the archbishop, the great magistral, and in fact the whole population, civil and religious, took part, with lighted tapers, amidst the clangour of trumpets, drums and the church bells. The altar-piece cost 3,000 florins of gold, out of which Duccio's pay was but 16 soldi per working day. But the materials were furnished him. In 1506 it was removed from the high altar (which was at the same time thrown further back in the church) to make way for the present bronze tabernacle, the work of X. Vecchieta, and became so completely lost to sight and memory that Vasari, about fifty years later, was unable to discover it. It was, however, brought to light again in the seventeenth century, when the front and back panels were sundered and otherwise deranged, and finally set up on side altars in either transept, where they are ill seen. Eighteen of the subjects of the predella and pinnacles, long preserved in the sacristy, are now in the Opera del Duomo (Office of Works) close by.

Mezzotint Engraving.

In its nature and execution mezzotint engraving is very peculiar. The artist rakes, hatches or punches the surface of the plate all over with a knife or instrument made for the purpose, first one way and then the other, across, &c., till the face of the plate be thus wholly covered with lines or furrows, close and, as it were, contiguous to each other, so that if an impression were thus taken from it it would be one uniform blot or smut. This being done, the design is drawn or marked on the same face, after which they proceed, with burnishers, scrapers, &c., to expunge or take out the dents or furrows in all those parts where the lights of the piece are to fall, and that, more or less, as the lights are to be stronger or fainter, leaving black those parts which are to represent the shadows or decipherings of the draft. It being much easier to scrape or burnish away parts of a dark ground, corresponding with the outline of any design sketched upon it, than to form shades upon a light ground by an infinite number of hatches, strokes and points, which must all terminate with exactness on the outline, and at the same time differ in their force and manner, the method of scraping as it is called, in mezzotint, consequently becomes much more easy and expeditious than any other manner of engraving. The instruments used in this style are cradles, scrapers and burnishers. The art of mezzotint engraving was at first considered as only adapted to broad subjects, and where high minute finishing was required it was thought vain to attempt it; but the great advance made since the introduction of the art has convinced every artist and amateur to the contrary, and the successful works of Earlom (especially his masterly flower-pieces) are admirable specimens of its power, as also are the beautiful productions of Hodges, Dixon, and many other English artists. It is decidedly most appropriate for the engraving of portraits, both as to touch and effect. The art of scraping mezzotint has been applied to the printing with a variety of colours, in order to produce the resemblance of paintings.

Alderman Boydell.

It is said of Alderman Boydell that "he contrived to employ every aspirant to distinction in the arts of painting and engraving whose energies wanted encouragement." He was himself an artist, and his love of the profession he chose may be judged by the fact that at the age of twenty-one he walked from Stanton, in Shropshire, to London, against the wishes of his father, to put himself apprentice to an engraver. That by his own exertions he rose to fame and fortune is less his praise than that he very greatly assisted other artists in their rise to eminence, men, too, whom he helped to surpass himself in his own profession. The "Shakespeare Gallery," though the greatest undertaking of Boydell, formed but a portion of his patronage of art. This magnificent scheme was an additional means of employing the best painters of the British school in large and important works at a time when the Church refused to patronise painting, and the tiled and wealthy of the land, with the single exception of the king, encouraged portraits only. It did much also for engraving, and, among other admirable specimens of that art, we owe to the Shakespeare Gallery Sharpe's transcendent work from West's *Lear*, a work showing that the power of a first-rate engraver, even of other men's designs, does not lie within the scope of mere talent, but that it is genius, and of a higher order than that displayed by many a painter, who looks upon engravers as artists much below him. Boydell built for the reception of his pictures the rooms in Pall Mall which afterwards belonged to the British Institution, and employed the greatest sculptor then living to decorate the front. It was his intention to bequeath the building and its contents to the nation. But the outbreak of the French Revolution by stopping entirely the sale of his prints on the Continent, where it had been extensive, and the war that followed diminishing the demand for them at home, his means were so crippled that he was unable to fulfil his patriotic wish.

NOTES AND COMMENTS.

THE desire to see an illustration of the adopted project of the Queen Victoria Memorial has diminished since it was announced that it was to be deprived, or at least for an indefinite time, of the grandeur which is only obtainable by the employment of architecture. The Government no doubt realise the fact, and probably it is on that account the permission is withheld to photograph or reproduce any sketch or model representing the Memorial. We are informed that attempts have been made to take "snaps" by the aid of miniature apparatus which would escape detection, but it is not to be credited that the humblest of English journals would, under the circumstances, defy authority, and disregard the arrangements of the committee, which no doubt are inspired by prudential considerations, and above all make the late QUEEN'S name a subject for a mercenary scramble.

INFORMATION has been given by the Treasury about the leasing of Crown property in London. It is stated that there has not been made recently any alteration in the practice of granting new leases. Where it is not considered necessary that the premises should be rebuilt negotiations are usually entered into with an occupying tenant for a renewal in preference to others, if there is one who is in a position to undertake the responsibilities of a lease and desires to remain in occupation. If the premises have to be rebuilt it is not always practicable or expedient to adopt that course. If not adopted the Commissioner of Woods could not undertake to warn all occupying tenants before making arrangements with others, though in practice such tenants would, by their own inquiries, become aware some time before their tenancies expire whether or not they could get a renewal. Crown lessees who are not occupiers are not considered to have any preferential claims to renewals. There is a touch of circumlocutionism about the declining to warn occupants that other people are eager to obtain leases of their buildings, but in practice the evil is, we believe, not oppressive. It should be remembered that the practice on the Crown estates is always likely to be taken as an example by owners elsewhere, and that reason alone should inspire equitable arrangements with old tenants.

THE risks incurred in the development of building estates were exemplified in the case *CROUCH v. ROBERTS*, which came before the High Court on Monday. When the case was first heard at the Birmingham Assizes we referred to the circumstances. Afterwards it was submitted to Mr. MORTON BROWN for a report. The action related to the development of the Selly Oak estate in Birmingham. The plaintiff, a builder, agreed to erect 133 small houses, the outlay being about 100% a house. According to him a substituted agreement was entered into that he should have leases of the land guaranteed to him in his own name by the defendant, who was the freeholder. The plaintiff raised money on progressive mortgages, and these amounts went towards the defraying of the cost of building. Plaintiff was to be paid the cost of building the houses, and he was to receive full payment from the defendant in the following manner, viz. whenever there was a sale of reversions of any of the leases sold the money was paid by the defendant to the plaintiff on account of building. Defendant paid over to plaintiff all amounts that were advanced in respect of the progressive mortgages. A lump sum of 1,000% was to be paid to plaintiff as profit. A large amount of money was advanced on three progressive mortgages, nominally to the plaintiff, because the leases were in his name. The money went to him, and he expended it in building. After a time the mortgages began to be called in, and defendant paid off most of them, but the time came when he stopped, and said there was a second mortgage for 350%, which he would not pay because it was outside the agreement. The mortgagee obtained judgment against plaintiff, and issued an execution. The plaintiff thereupon brought his action against the defendant, setting up that under the agreement he was to be indemnified against all losses in connection with the mortgages. The jury answered the questions in favour of plaintiff. Mr. MORTON BROWN reported that the amount owing by defendant to

plaintiff was 6,231*l.* 9*s.* Counsel on Monday asked for judgment for that sum. For defendant a counterclaim for 250% was raised, but after some discussion was struck out, and it was agreed that there should be judgment for the plaintiff on the claim with costs.

THE First Commissioner of Works, when referring to the proposed widening of Piccadilly, said he had no control over the regulation of the traffic in London streets. If we may draw a conclusion from some decisions given in the police courts, it would appear that the magistrates are as ignorant on the subject as the people who suffer inconvenience by blocks in streets. Yet there can be no doubt that if a firm control were exercised over the traffic, and especially over carts and waggons, there would be fewer necessities for the costly alterations of such thoroughfares as Piccadilly. Let any one who travels along that highway roughly analyse the conveyances that overspread the road, and it will be found that without involving the owners in heavy losses, many of the vehicles could be diverted in other directions. It would be necessary no doubt to increase the number of policemen, but the payment to them would be trivial in comparison with the expense which will be necessary if Piccadilly has to be widened. But there is another consideration. If a part of the Park and its trees must be sacrificed, no money can restore the peculiar character which at the present time gives an unique charm to Piccadilly. Nor will the widening be sufficient to insure an unimpeded course for all the traffic which can find its way there. To overcome the obstacles in Piccadilly it will be necessary to have more streets running southward, and to obtain them the beauty of the Green Park would be destroyed. Of course, after the proposals for a colossal alteration of St. James's Park, that arrangement would not be thought much of a sacrifice, and, indeed, there is in London at the present time a spirit in public and municipal offices which is not unlike that which prevailed in certain circles in Paris when HAUSMANN commenced his operations. The picturesque counts for nothing, and old associations are swept away with as much ease as if they were fallen leaves. London seems to be destined to lose the character which gives it interest in order that it may become a weak imitation of a continental city.

THE erection of the City Hall in Philadelphia has occupied about thirty years, and the outlay has been 24,138,592 dols., or nearly five millions sterling. Of that sum 402,472 dols. were expended on preparation of site, water-supply, legal expenses, &c.; 5,477,052 dols. on rent of temporary offices, fittings, and furniture, and 17,860,067 dols. on construction. According to a statement prepared by the architect, Mr. BLEDYN POWER, the principal items of construction were as follows:—Excavation, foundation-stone and machinery, 359,668 dols.; granite and blue-stone work, 542,407 dols.; marble and marble-work, 5,467,503 dols.; dressed stonework, interior, 2,112,560 dols.; bricks and brickwork, 1,109,410 dols.; cast and wrought-iron work, 1,589,747 dols.; metalwork for tower, 830,829 dols.; all remaining works, 5,547,941 dols. A provincial city in England would hesitate before undertaking so vast an expenditure. American architects are, however, encouraged to devote all their energy to a building when the reward will be so liberal. With such prospects before them, it is no wonder the architects expend money generously on their education, for, in order to pass through University courses, to study in Paris and pay pupils' fees, the money required to prepare an architect for the practice of his profession amounts to a large sum.

JESUS CHAPEL, WORCESTER CATHEDRAL.*

THE following report by Mr. R. A. Briggs, the architect, which accompanied the design for restoration of the chapel since carried on, will explain the treatment of the screen and altar represented in the plates:—

In accordance with the instructions received, I now beg to forward the designs I should suggest for the proposed new screen and altar to the Jesus Chapel in Worcester Cathedral, and I venture to give expression to the general view of the subject which has led to my treatment of the new work in the chapel.

From records with which many are probably acquainted—extracts from some of which I append—it is clear that in former days "Jesus chapels" were intended for the special accentuation of the Perfect Humanity of Our Lord, and the scheme of decoration which would naturally be deemed suitable should illustrate His earthly life. Not being a theologian, my suggestions are naturally subject to revision by the members of the Chapter.

The literature concerning Jesus chapels is very limited, and only exists in scattered references. According to Bridgett's "Holy Eucharist," vol. ii. page 85, Jesus chapels were always dedicated to the "Holy Name," as in the Jesus Colleges of Oxford and Cambridge. At Enfield there is a Jesus Chapel, and from the records of the chapel it is clear that it was also so dedicated. It appears from the "Liturgical Year," vol. ii. page 259, Christmas, that the devotion to the Holy Name originated in England, but did not become general on the Continent until the fifteenth century. The first special office of the Holy Name given to the Franciscan Order was granted by Pope Clement VII. in 1530. It was extended to the Carthusians in 1643, and was finally promulgated to the Latin Church by Innocent XIII. in 1721.

The following is a description of the ancient Jesus altar in Durham Cathedral from "Ancient Monuments, &c., of the Church of Durham," Surtees Soc., page 28:—

"In the body of the Church . . . over against the Quere dore, ther was an Alter called Jesus Alter, where Jhesus mess was song every fridaie thorowe out the whole yere. And at the backsyde of the saide alter there was a faire high stone wall; . . . ther was standing on the Alter, against the wall aforesaid a moste curiouse and fine Table with ij leves to open and clos againe, all of the hole Passion of our Lord Jesus Christ, most richlye and curiously sett furth in most lyvelie colors, all like the burninge gold, as he was tormented, and as he honge on the cross, . . . the which table was alwaies lockt up, but only on principall daies . . . And on the principall daies, when any of the Monnks said Mass at that Alter, then the Table was opened, which did stand on the Alter."

A description follows of the decoration of the wall, "the whole storie and Passion of Our Lord wrowght in stone, most curiously and fynely gilte," above which came the rood.

In the church of the Holy Trinity, Long Melford, according to the "History of the Church of Long Melford," by E. L. Conder, London, 1887, p. 39, there was a Jesus Altar, which stood in the Martyn Chapel, which was also called the Jesus Aisle. Roger Martyn, writing in the reign of Elizabeth, says:—

"There was also in my Ile, called the 'Jesus Ile,' at the back of the Altar, a table with a crucifix on it, with the two thieves hanging, on every side one, which is in my house decayed, and the same I hope my heires will repaire, and restore again one day. There were also two fair tilt tabernacles from the ground up to the rooffe, with a fair image of Jesus in the Tabernacle at the North end of the Altar, holding a round bawle in his hand, signifying, I think, that he containeth the whole round world; and in the tabernacle at the South end there was a fair image of our Blessed Lady having the afflicted body of her dear Son, as he was taken down off the Cross, lying along on her lap, the tears as it were running down pitifully upon her beautiful cheeks, as it seemed bedewing the said sweet body of her Son, and therefore named the Image of our Lady of Pity."

In the "History of the Holy Eucharist," vol. ii. p. 85, Mr. Joyce, writing to the Rev. T. Bridgett concerning the windows in Fairford Church, Gloucestershire, says:—

"Regarding the Jesus Altar (in this church at the end of the South Aisle), the window represents Our Lord in His Transfiguration with the Sacred Host on His breast. It is a small circular disc in diameter 1½ inch, from the edge of which proceed all round darting rays as from a sun. On its lower circumference the rays lengthen, and underneath at the centre three very long straight beams of sunlight stream downward toward the persons of the three favoured apostles, spreading as they go. Within the disc are the letters I.H.S. The date of the window is about 1500."

An old writer says regarding this particular devotion that—"It seems in some measure to comprise every mystery,

every mercy, every title of honour, every benefit, every grace, every effort of divine love which we adore in the whole process of His Incarnation, Life, Death and Resurrection, Ascension and coming as Sovereign Judge of the living and the dead. The sacred name of Jesus presents to our mind the majesty and glory of His Divinity—the most Endearing Charms of His Humanity under the character of the *Divine Saviour*. This is the name at which devils tremble." (H. J. Feasey: "Notes on Holy Days—August.")

Worcester Cathedral was dedicated in 1218 to the Blessed Virgin, St. Peter, St. Wulstan and St. Oswald (Willis on Worcester, *Arch. Journal*, vol. xx. p. 88). The nave was built in the Decorated style in 1317-27 on the north side. The south side is Decorated with a strong tendency to Perpendicular, built 1360. (King's "Three Choirs," p. 6.) Leland ("Itin." viii. p. 104) says that Bishop Cobham, 1317-27, vaulted the north aisle of nave (Jesus Chapel).

The Jesus Chapel was open to the nave as it now stands in 1750; the present stained glass was done by Wailes and given by Canon Wood as a memorial to his wife. (King's "Three Choirs," p. 19.) The ancient Jesus altar was destroyed by Bishop Barlow in 1550. In Abingdon's "History," 1723, there was in the Jesus Chapel window merely some arms, thus:—"Argent, a lyon rampant; gules, with a border sable; besantee." (Abingdon's "History," pp. 4 and 22.)

Worcester Cathedral contained a great number of altars and monuments (Willis, *Arch. Journal*, xx. p. 88), amongst others the following:—St. Mary, St. Peter, St. Edmund, St. Dunstan, St. Simon and St. Jude, St. John Baptist, St. Mary Magdalen, St. George, St. Nicholas, St. Thomas of Canterbury, St. Oswald, St. Egwin (bishop of Worcester, A.D. 693-707, and abbot of Evesham).

St. Wulstan, the founder of the cathedral, died 1095, canonised at Rome, 1203 (Willis, *Arch. Journal*, xx. p. 87), bishop and confessor. Symbol—figure or model of the church built by him showing an apsidal east end. He was canonised by Pope Innocent III.

Bishop Walter de Cantilupe (died February 4, 1266; Abingdon, 100) was held in great veneration, and when his tomb was opened the body was fully vested (Willis, *Arch. Journal*, xx. p. 132), had a curly beard and moustache, and was vested in a low mitre. The right hand upheld, and the forefingers of the left probably grasped a pastoral staff. The usual vestments, the chasuble being very ample. Over the chasuble is worn a quatrefoil rationale. The amice is apparelled—maniple fringed and jewelled. Under the chasuble is a dalmatic, albe ornamented with richly jewelled apparels. (*Gentleman's Magazine*, October 1862, p. 426.)

Thomas Cobham (King's "Three Choirs," p. 13), bishop of Worcester, made the vault (Willis, *Arch. Journal*, xx pp. 132 and 108) in the north aisle of nave, and held the see from 1317-27. He was buried in the north aisle of the nave, opposite the window of Jesus Chapel, and Leland says that it is probable he was there buried as a benefactor in the midst of his own work. In his will he gives (1327-40) 20*l.* to the fabric. His effigy shows him vested for the altar—arms or, a chevron gules. (*Gentleman's Magazine*, 1862, p. 427.)

Bishop Bryan's tomb was beneath the window under the arch in the Jesus Chapel. The figure is represented lying thereon, his head mitred and supported by angels, his hands joined as in prayer, and at his feet a lion. On left side of tomb three escutcheons, in the middle three piles in point, on the middle pile a bishop's mitre, and under that a cross fitché. In the dexter three piles in point. In the sinister the same arms impaling three fusilles in fesse. (Abingdon, 28.) In Dr. Thomas's survey of the cathedral, on page 103, is a plate of his tomb.

Bishop Humenhall's tomb was also originally in the Jesus Chapel; died 1338. His statue is much mutilated.

Bishop William de Blois, also buried near chapel, died 1236. Effigy shows face smooth. On head is a low mitre. In front of chasuble a lozenge-shaped rationale, jewelled. Folds of chasuble numerous. One end of fringed stole only appears. No dalmatic or tunic, but maniple ornamented with jewels. Right hand is upheld with two fingers raised in benediction; left hand grasps pastoral staff. (*Gentleman's Magazine*, 1862, p. 425.)

Nicholas Heath (1551) was deprived for noncompliance with Edward's new order, and imprisoned in the Fleet until Queen Mary's accession. He was restored by her and made President of Wales and Chancellor of England. (King's "Three Choirs," 76.)

The ornaments or relics in Worcester Cathedral before the Reformation belonged to the following Saints (see the Inventory to be found in the "Transactions of the Archæological Society of Worcester," vol. ii. p. 305, 1871-72):

"*Belonging to Seynt Oswald*.—A cope of yalowe satten the picture off perles set upon golde. A Cheasable of yalowe satten to the same. Another Cheasable of blacke selke wth the holy lambe and cross on the backe. A stole of nylde worke set wth stonys perlys. A gyrdell of changeable selke platted at

* See Illustrations, August 2 and 9.

the yendes. An Albe of clothe and golde, the fore part thereof set w^t perlys stonys.

"*Belonging to Seynt Ulstan.*—A cope of yalowe satten and a Cheasable of yalowe satten browdered a bowte the colar w^t nyldewarke and golde, an albe of Storye warke. A nother cope of crymson satten broddred a bowte all the colar w^t nyldewarke and golde ij stolis on of them blewe satten w^t perlis at the yendes and golde, the hother stole changeable sattens set at the yendes w^t perlis and golde. A fflanel of blue satten, the yendes perle and the clothe of golde, c j gyrdylls on of grene selke the other gyrdyll knytt after nett wyse.

"*Belonging to Seynt Dunstane.*—A stole and a fflanel red selke wrought w^t golde and nyldewarke, the yendes clothe of golde. A fflanel of Seynt Allphege, the yendes clothe of golde set w^t perlis a stole of Seynt (Aldulfe)."

The style of the proposed screen is that of the fifteenth century, and as there are no records that I am aware of to show when the original screen was built, and as it has entirely disappeared, I have chosen the period of architecture when the best screens extant were erected, and the style which lends itself most to an artistic treatment of a stone screen.

The screen is 15 feet 6 inches high to the top of the cornice below the brattishing, and I should propose it being executed in Portland or some other coloured stone, which would be suitable, as the details are small and delicate. Niches are provided so that figures could be added if desired.

On the central pinnacles over the screen is an historical group, consisting of Our Lord on the Cross with St. Mary and St. John on either side. The pinnacle on the extreme left has the pelican in its piety, and on the right the sacred initials. On the scroll to the cross are the words of Our Saviour, "Eli, Eli, lama sabachthani." The screen towards the chapel will be very simple and plain. The door would be of oak.

It is proposed to remove the Fleetwood tomb to another part of the cathedral as shall be arranged. The existing floor will be taken up and relaid, using where possible the existing slabs. One step will be provided to the altar.

The altar and reredos are proposed to be in mahogany, gilt and coloured. The shelf or gradine, popularly known as the retable, is to be of Portland stone.

The following is a description of the figures and sculptured panels:—In the central panel of the reredos is a figure of the Virgin holding the Infant Saviour on her knee in the act of blessing. On either side are figures of St. Wulstan and St. Oswald—patron saints of the cathedral. On each side of the above-mentioned panels are figures of the Twelve Apostles, and on the outer buttresses are figures of six bishops of Worcester, viz. St. Egwin, Walter de Cantilupe, Thomas Cobham, Bishop Bryan, William de Blois and Nicholas Heath. Immediately above the canopy over the central panel containing the figure of the Virgin and the Infant Saviour is a figure of Our Lord holding in His hand a ball, as in the Jesus Chapel of the church of the Holy Trinity, Long Melford, before referred to. On either side are angels bearing the emblems of the Passion. On either side are figures of St. John the Baptist and St. Mary Magdalene. At the apex of the canopy over the figure of Our Lord is an angel holding a crown.

Immediately above the retable are five sculptured panels illustrating five miracles of Our Lord, referred to in St. Matthew xi. 5:—(1) The blind receive their sight; (2) The lame walk; (3) The lepers are cleansed; (4) The deaf hear; (5) The dead are raised up. Between each panel is the figure of an angel.

The reredos has two leaves, as in the original Jesus Chapel at Durham, which will be made to open and shut. On these leaves are bas-reliefs depicting the principal events in the life of Our Lord. On the left-hand leaf are—(1) The Annunciation; (2) The Nativity; (3) The Adoration of the Magi; (4) Christ Teaching in the Temple. On the right-hand leaf are the scenes from the Passion:—(1) Mount of Olives; (2) The Agony; (3) The Betrayal; (4) The Scourging. On the back of the leaves will be painted the Tree of Jesse in gold and colour.

The altar, which is also of mahogany, contains in the central panel a bas-relief of the Virgin holding the body of Our Lord, with two attendant angels. On either side in two panels are guardian angels, and in two other panels are figures of the archangels Michael and Gabriel. It is proposed that the cross on the altar shall be of crystal and copper gilt, and the two candlesticks of copper gilt. On either side of the altar will be curtains hung on a brass rod.

"**The Result** of the competition for the Mallock Memorial, Torquay, has now been published. The successful competitor is Mr. Donkin, F.R.I.B.A., of Bournemouth. The number of designs submitted was seventy-nine. Mr. Hine, architect, of Plymouth, assessed the designs on behalf of the committee, and his recommendation of Mr. Donkin's design was accepted by them.

KING ALFRED'S JEWEL.

THE subject of the Bishop of Bristol's address as President of the Somerset Archæological Society was "King Alfred's Jewel." His lordship said:—

I must first of all express my grateful thanks to the Society for the honour they have conferred upon me in making me their president for the year. It is, I think, some fourteen years or more since I contributed a rather lengthy paper to your Proceedings on the subject of some pre-Norman sculptured stones, of which you still have a few in your county. I was living in Cambridge at the time, and could not be present at your meeting. It is therefore especially interesting and pleasant to me to see at last your Society face to face.

In that paper I worked out at some length the early records of artistic work connected with Somerset, and I went into some of the details of St. Aldhelm's care for art, making special mention of the sculptured crosses which those who mourned for his death erected at each place where his body rested for the night on its seven days' journey from Douling, in your county, to his old home at Malmesbury, in North Wilts. If there was at that time any one thing more improbable in my future than another, so far as I could have judged, it was that in this year of grace 1901 I should have under my care as bishop some 100,000 souls on the Somerset side of the Avon, and should have in my diocese all those parts of North Wilts through which St. Aldhelm's body passed on its way to the Saxon predecessor of that ancient charge of mine, the abbey church of Malmesbury.

This coincidence suggested to me that I should lay before you the steps I have taken towards an identification of the places in Somersetshire and Wiltshire at which the Aldhelm crosses were erected, with some account of the sculptured fragments which remain in the neighbourhood of at least two of the resting-places.

Another subject with which I proposed to deal was the puzzling question of how it ever came to pass that Bath and its district was stolen from Mercia and transferred to Wessex, where it met with very unhandsome treatment on the part of Wells. This subject has been treated by the Rev. C. S. Taylor. It would have lent itself to specially-pointed treatment at the hands of the Mercian bishop to whom, of course, Bath and its district ought to belong, in the presence of the West Saxon bishop who represents the hand of the spoilers of a thousand years ago, and has never to my knowledge expressed any desire to make restitution, or any sense of shame in the retention of the spoil.

The third question with which I had proposed to deal was the difficult matter of the line of separation between the Huiccas, on this western extremity of their southern boundary, and the south-west Britons in the earlier time and the Saxons of Somerset in rather later times. The special point of this investigation is to show that Aust never was on the boundary, and so is out of court as a competitor for the honour of being the place of Augustine's first conference with the Britons.

But this is King Alfred's year; and the Somerset folk have quite as much part in Alfred as the North Wilts part of my diocese has. This was borne in upon me so strongly less than two days ago that I changed front completely, and have hastily gathered up an address on the special link which binds Somerset to the person of Alfred, namely, the jewel found at Athelney 208 years ago. My remarks will have for their purpose to supplement, and in some respects to differ from, the beautiful and suggestive book on the Alfred jewel recently written for the Clarendon Press by your own Professor Earle, a greatly honoured name and personality.

I am the more moved to take this subject because I am unable, by reason of a prolonged absence in Italy, to be present at Winchester in September as the representative of the Society of Antiquarians of London.

You know the jewel well, many of you, and I hope that many of you know the book too; those who do not should lose no time in reading it straight through from one end to the other.

The jewel, as you know, is a small thing of gold and enamel and rock crystal, the shape of an oval battledore with a short handle. It is only $2\frac{1}{2}$ inches long, $1\frac{1}{2}$ wide and $\frac{1}{2}$ inch thick. The enamelled side shows through a plate of rock crystal the upper part of the body of a man, with long attenuated face, holding in each hand the stem of a floriated sceptre; the two sceptres rest on the shoulders of the figure. The back of the jewel is a plate of gold, with a symmetrical pattern of foliage engraved on it. The handle is the neck and head of a scaly monster, ending in a hollow snout, by which the jewel was firmly attached, no doubt in a vertical position, to some stem; the rivet which fastened it to its stem is still there. I accept without reserve Professor Earle's conclusion that the jewel was the ornament of Alfred's helmet, and with rather less confidence his conclusion that it was designed and wrought before Alfred was king. On the latter point Professor Earle's argument that if Alfred had been king the word "cyning" would have been in-

serted in the inscription, in that or some other form, is almost, but I think not quite conclusive. The inscription is quite complete, and is "Ælfred mec heht gewyrca"—"Alfred me caused work"—"Alfred had me made." Professor Earle's remarks on the philology of this inscription are those of a famous master, and it would be a mere impertinence on my part to express the conviction they have wrought in me. On a question of palæography I feel it less impossible to hazard a remark. I am greatly surprised that Professor Earle, in dealing with this part of the subject, maintains the silence which seems always to prevail as to the non-existence of the letter y, in place of which a little piece of foliage is inserted in the inscription. Those of us who study Bristol and Plymouth china know what disguised numerals mean, but this, if a y, is very highly disguised; indeed, if we had not conspicuously wanted a y there I venture to say that everyone would have taken the floriation to be a pretty but unusual device for filling up the space of one letter, instead of putting the filled-up gap at the end of the word. And there is another point in the inscription which is passed over without remark, as though it had no meaning whatever—I mean the line or dot between the two halves of the w. There is no other example of a dot in the inscription, and this dot is where no dot ought to be. Now there are on the jewel two cases of bind-letters—me and ht. Is the dotted w a bind-letter? At Chester-le-Street they found one day when I was there an Anglian stone, with a man on horseback and a name incised, which they could not read. I pointed out that it was a mixture of Roman capitals and runes, and it read Eadmund; there was no difficulty in assigning it to the grandson of King Alfred, Athelstan's half-brother, who stopped at Chester-le-Street when riding up to invade Scotland, and made gifts to St. Cuthbert of which we are to hear more. It so happens that this dot, if treated as having something to do with a rune, will supply the missing y, though not the y which philology would require. The two middle strokes of the w are the rune for u, and the dot or short vertical line is the recognised means of modifying the u into a y. It is so in the minden-stin of Gorm the Old, where Queen Thyra is in runes Thura, but the rune u is dotted as on the jewel. Gorm became King of Denmark at the time when Alfred was in Rome as a boy, and did not die till near the end of Athelstan's reign, whence his sobriquet. It is so in our earliest existing piece of English literature, the great runic inscription of the year 670 on the Bewcastle Cross, where Kyng, Kyning, Kyninges, Kynnburug, Kyneswitha, Myrkna, all of them have for their y a runic u, with a mark inside it. I am well aware, as I have said, that the y in gewyrca has a different origin from the y in Kyning, but at least the coincidence is curious. I confess my folly in pointing it out.

But at the same time I must say that anyone who deals with this inscription cannot safely pass this remarkable dot without a word. If anyone should suggest that its purpose is to occupy a void space, I should reply that such an explanation touches a principle of early lettering to which I have often called attention.

I cannot go with Professor Earle in his belief that the figure in enamel represents the Pope, with his spiritual and temporal sceptres. That idea does not link itself on to anything that I, at least, know either of Alfred or of art, but in a matter of this kind no one should commit himself to a sweeping negative. It is of course true that the young Alfred was brought into very intimate relations with the Pope, and there can be no doubt that he shared the then universal feeling of all the Courts of Europe with respect to the spiritual head of the Church of the West. But I suspect that his ideas of the temporal sovereignty of the Bishops of Rome were likely to take their shape from the Imperial domination over the appointment of the Pope, which showed itself in so drastic a form in the case of the Pope and anti-Pope when Alfred was in Rome on the second and more important occasion. Further, there is not the faintest suggestion anywhere of any such feeling as should induce Alfred to regard himself in practice as the soldier of the Pope, fighting the Danes under his auspices. The whole story of his wars goes quite another way; he was the soldier of Christ. As I have remarked in my essay in the Alfred book of 1899, Asser does not speak of wars between Saxons and Danes, or Angles and Danes; he speaks throughout of wars between Christians and Pagans. Alfred to him is the champion of Christ. Alfred's wars are against Pagans, not against Danes. As soon as the Dane became Christian he might remain in the land.

As a matter of experience in ecclesiastical art, we are very familiar with the two sceptres carried by Our Lord when shown in His glory. On one great cross after another in Ireland there is the Crucifixion on one side, and on the other side the Lord seated in glory, with a sceptre on each shoulder. Professor Earle gives the representation of the Temple in the Book of Kells, which I see he still calls a seventh-century MS., though its label was corrected to "eighth century" some years ago. In this is a full-face representation of Our Lord, of the Irish type, with the two sceptres. I shall continue to take the

jewel to be Alfred's badge as the soldier of Christ, notwithstanding the absence of a nimbus.

Professor Earle omits to note one of the marked features of the twin sceptres. They are in one piece, not in two, as in the Book of Kells and on the Irish crosses. And they are so drawn as to give the idea of a strong spring at the place where the two stems meet, as though their shape when not in use would be that of a pair of tongs with a spring instead of a hinge and handle, and as if some little force were required to keep the two members wide apart, so that one may rest on each shoulder. I would suggest a reference to the two very remarkable crosses at Sandbach in Cheshire, one of them the largest in the kingdom, both of them wonderful records of Anglian art. On each of them there are two figures by the side of Our Lord, the dexter figure with a book, the sinister with a large key, presumably St. Paul and St. Peter, certainly St. Peter on the left side. In each case the key is two keys, their stems joined at the extremities, "a pair of keys," just as we see and speak of "a pair of tongs." If these keys were opened like a pair of tongs, they could be held like sceptres on the two shoulders, and the wards would lie symmetrically like little square bags where the head of the sceptre would naturally be.

As regards the symmetrical and very pretty foliaginous device engraved on the plate of gold at the back of the jewel, I cannot go with Professor Earle in seeing that the stem of the plant, growing out of the very usual cup or sheath, is a sword piercing a heart. To those of us who have for many years closely studied this kind of ornamentation, there is nothing unusual or specially allegorical about the pattern. Even if the cup had been a heart, there are plenty of examples of a heart-shaped boss on the stem of foliage, like the pear-shaped bosses on Renaissance candlesticks. The heart boss is found quite clear and precise on the little portable altar found on St. Cuthbert's breast, and also, even still more clear, on the end of Frithestan's stole, to which we must now turn. Professor Earle does not make use of this apt illustration of the Alfred jewel.

The stole of Bishop Frithestan of Winchester was given to the body of St. Cuthbert at Chester-le-Street by Athelstan, Alfred's favourite grandson. It was worked at Winchester between the years 905 and 916, by order of Ælfæd, the queen of Alfred's son and successor Edward. It has the Latin form of Alfred's own inscription, "Ælfæd fieri precepit," "Ælfæd caused to be made," the Latin passive taking the place of the Saxon active. It is a wonderful piece of work, woven in flat gold wire, with self-edged openings for the insertion of tapestry-work figures of prophets and letters of inscriptions. It was made, as itself declares, for the pious Bishop Frithestan. Ælfæd died in 916, and Frithestan became bishop in 905, so we have the date sure.

Now, not only does Ælfæd's stole carry on her father-in-law's inscription, only spoiled by its ecclesiastical purpose which turned it into Latin, but I suggest a more important connection still. Professor Earle finds the type of the face of the figure in Irish art. But it is in outline long and rather emaciated, and the faces in the Book of Kells are plump and well-liking. I find just the right length and thinness of face in the prophets on Ælfæd's stole, and I venture to suggest that Alfred's artists and Ælfæd's went to the same Byzantine source for the faces of their figures. Inasmuch as the Irish art was not improbably Byzantine in origin, Professor Earle's remarks about the eyes of the figure on the jewel may well be in point, for the treatment of eyes on sculpture and in parchment in the earliest times in these islands followed rather closely accepted types, while other parts varied. The specially close relationship between Alfred's jewel and the Winchester stole of the next generation will be found not only in the shape of the face, but also, and very pointedly, in the outline of the hair.

There is another and more remarkable parallel to the inscription on the Alfred jewel, to which also Professor Earle does not refer. Indeed, I suppose that very few of us are aware of it. I delivered a lecture on the subject in Cambridge when I was Disney Professor there, and as the whole of the story makes a very interesting romance of ecclesiastical art, I will take this opportunity of setting the facts before you in brief. I am far from sure that it has not something to do with these parts, as you will see in the end.

Some of you, no doubt, have seen in the treasury of the church of St. Gudule, in Brussels, the great reliquary, in the form of a cross, which is said to contain the two largest portions of the true cross in existence. Erasmus, who knew the Low Countries only too well, declared in his notes on the whitened sepulchres of St. Matthew xxiii. 27, that there were enough portions of the true cross, if they were collected, to freight a large ship. There is also in this St. Gudule reliquary one of the nails of the cross, which the visitor can see through a piece of glass. The cross has at its centre a crown of thorns, and on the arms and head and stem a number of the emblems of the Passion. There is no inscription, and there is nothing really old about the reliquary.

In 1891 Dr. Logeman, the professor of English philology at Ghent, became possessed of a manuscript which described an inscription of a curious character on this cross, in a language which the writer of the manuscript had not understood. It was sufficiently like Flemish to tempt him into some very quaint interpretations, but it was not Flemish. No such inscription, nor, as I have said, any inscription at all, could be seen upon the cross as it stood in the treasury, examine it as you would. At this point it will be well to relate what is known of the history and provenance of the cross from which this remarkable inscription had so completely disappeared. It will eventually give us an interesting clue.

The reliquary was given to the church of St. Gudule by the Archdukes Albert and Isabella by their will; it had been one of the ornaments of their chapel in Brussels since 1605. The Archduke died in 1621, and the Archduchess, who was a daughter of Philip II. of Spain, and had the Netherlands for her dowry, ruled alone after the death of her husband till her own death in 1633, when their will took effect, and the reliquary came to St. Gudule. It had come to the Archdukes—I wish we still retained that royal use in England, and spoke of the Princes of Wales and Dukes of Cornwall, *principes* and *duces*, not *principem* and *principissam*, *ducem* and *ducissam*—it had come to them from Cologne, to which place it had been carried by the Bishop of Haarlem when he fled from the reformers in 1573. It had reached the Low Countries long before, when Egbert, Archbishop of Trèves, gave it to the abbey of Egmond. This Egbert, whose name is suspiciously English—indeed, there is scarcely any not-English Egbert before 1100—is said to have been a son of Theodoric II., Count of Holland. This reigning count, Dietrich or Thierry, ruled Holland from 963 to 988. He was allied to English families, and his son Egbert is said to have exploited this insular connection. He invited his English friends and relatives to visit him at Trèves, and when he got them there he spoiled them of their goods, and made them send over as ransom a number of other precious things for the adornment of his chapel. We will remember that date, 963 to 988, to which we seem to have traced the cross.

At the time of the French Revolution the cross was plundered of its jewels and broken in two pieces. In the same year, 1793, it was restored, covered on the front with copper, and attested and sealed by the Papal Nuncio. This copper covering, with the emblems of the Passion, is the front of the cross as we have seen it. Dr. Logeman interested the Dean of Brussels in the investigation which the manuscript had set going, and as the Dean of Brussels is usually a personage of importance at Rome, he was enabled to break the Nuncio's seals and remove the copper covering. There stood revealed a singularly graceful and beautiful Anglo-Saxon cross, with plates of embossed silver, the Agnus Dei in the remarkable attitude found before the Norman Conquest in England, the symbols of the evangelists, an inscription across the arms of the cross, and a long inscription running completely round the silver plates on the edge of the cross, from the bottom at one side, round the arms and head and down to the bottom on the other side, all in Anglo-Saxon. Across the arms, in beautifully dainty lettering, is the inscription "Drahmal me worhte," "Drahmal wrought me." Who Drahmal was we do not know; the name does not occur elsewhere. The inscriptions on the edges are—to turn them into modern English—"Rood is my name. Once I bare the rich King, trembling, blood-bedabbled. This rood Æthelmær caused work, and Adelwold, his brother, to the glory of Christ for the soul of Ælfric their brother."

Now here we have two—or rather three—examples of the persistence of a form. The work of art itself speaks. It was so in the earliest sacred song of the English race which has come down to us, 200 years before Alfred, 300 years before the end of the reign of the father of Archbishop Egbert of Trèves, the great sacred song of which there are stanzas in runes on the cross at Ruthwell, in Dumfriesshire, erected about 680; it was so with Alfred's jewel; it is so with Drahmal's cross. That is the first point. Next, the cross of Drahmal has exactly the words on it which are found on the Ruthwell cross, "I bare the rich King," the cross thus telling of the Crucifixion, and "with blood bedabbled." That same great sacred song is found in the Vercelli MS. of Anglo-Saxon poems, a MS. of the tenth century, at much greater length than on the Ruthwell cross. In this MS. the poem is in the dialect of Wessex, not of Northumbria. Drahmal got his inscription from the Wessex MS., not from the Ruthwell cross, for while the words, "I bare the rich King" and "with blood bedabbled" are common to the Ruthwell cross, the Vercelli MS. and Drahmal's cross, the assertion of Drahmal's that it trembled under its burden is not given in that form on the Ruthwell cross, but the Vercelli MS. makes the cross say "that I trembling saw." That is the second point. It is the third point that links us on to the Alfred jewel. "Drahmal me worked." "Rood is my name." "This rood Æthelmær caused work." Here we have the "me," and the "caused work" and the order of the jewel, "Ælfred me caused work."

The jewel has "Ælfred mec heht gewyrcean." When a

hundred years had elapsed "mec" had become "me," and "gewyrcean" "wyrcean." This leads us to the question of the date of Drahmal's cross.

Remember the dates we said we would remember—963 to 988. The only instance in English history in which the names found on Drahmal's Cross, Æthelmær, Adelwold and Ælfric, are brought near together occurs in the Anglo-Saxon Chronicle for the years 982, 983, 984. That is a surprising coincidence, of which, however, it is possible to make too much. They are not described in the Chronicle as brothers, but no student of the Chronicle will be disturbed by that omission. In the Chronicle Ælfric survived Æthelmær and Æthelwold, and Drahmal's Cross was made by order of Æthelmær and Adelwold for Ælfric's soul. But in the Isle of Man about that time people were setting up crosses for their own soul and the soul of a relative, and it is not at all necessary to take it that Ælfric was dead. Indeed it is very easy to imagine circumstances under which two brothers might cause a costly work to be produced for the safety of the soul of a brother for whom they were anxious. This would be specially likely to be so if one of them was a Churchman of much piety and the other a layman of great position who knew the dangers of the times, while the brother for whose soul the costly work was wrought was perhaps a good deal younger than they, and was a man likely soon to be set in the midst of many and great dangers. This exactly describes the three men whose names occur in the Chronicle. In 982 Dorsetshire was ravaged by Vikings. London was burned, and Æthelmær, Alderman of Hampshire, died, and was buried in the new monastery at Winchester. In 983 Ælfhere, Alderman of Mercia, died, and Ælfric succeeded to the same aldermanship. In 984 died Æthelwold, the benevolent Bishop of Winchester, father of monks. In 985 Ælfric was driven from the country. The abstract guess that Ælfric might be a young brother, for whom the two older men were anxious, has received since I wrote it a curious confirmation. I find that he was called in Saxon "Ælfric child" and in Latin *cognomento puer*.

Thus I think that in working out our parallel with the inscription on the jewel we have done something to claim for Wessex that beautiful Drahmal Cross and Drahmal the artist himself. I think that Bishop Æthelwold and Alderman Æthelmær, both living in Winchester, arranged the design, and had it worked out by the head of the Winchester school of artists in gold and silver, a man after King Alfred's own heart, Drahmal. Bound up with the validity of that claim is the intercommunion of governorships between Mercia and Wessex, that most puzzling typographical question, a few years after the date at which our distinguished member, the Rev. C. S. Taylor, has, I think, shown that Bath and its district passed over finally from my jurisdiction to that of Dr. Kennion here present.

I may add that Dr. Logeman sent over to me in 1891 his original photographs of the whole of the Drahmal Cross, and most kindly allowed me to prepare lantern slides from them. As I am to give several lectures on early art in Bristol next autumn and winter, there will no doubt be an opportunity for showing these slides.

I may also perhaps be allowed to lighten the course of a heavy address by telling you of two of the quaint translations made by the author of the MS., on which the whole discovery turned. The word "bedabbled" is in Anglian and Saxon alike "bestemed." This the ingenious person took to be two Flemish words, *beste med*, and he translated it *optima virgo*. "Blode" he felt sure meant blood, as in fact it does. "Wyrcean" is spelled of course with the Saxon *wen*, and looks like "Pyrcan." He knew the connection between *l* and *r*, and between a pelican and blood, and he translated it Pelicanus.

I ought in fairness to say that the expert whom I consulted was of opinion that the language of the inscription is of date later than 980, perhaps forty or fifty years later, perhaps even more. But while I am always most grateful to experts for their opinion, I do not allow it to overwhelm facts. Besides, I have recently had five furnaces and grates put into my house for cooking my dinner and warming the water for my bath instead of two, by an expert, and another expert has not only heated my wine-cellar, but also diverted a flood of water and mud into the room where my candidates for orders are examined. So I am at present, as the American trader dying to secure an expert would say, "rather off experts."

You will, I am sure, heartily join with me in one concluding remark, that we felicitate the University of Oxford, which at present possesses this noble Somerset property of ours, on having found so admirable an exponent of its interest and its charms as Professor Earle has proved himself to be. Speaking to Somerset people, I need scarcely remark that they had, of course, to come to Somerset to have it thoroughly well done.

The *Prix Bailly*, of the value of 60*l.*, has been awarded to M. Malgras-Delmas by the Académie des Beaux-Arts, for his drawings of the Palace of Fervaques at Saint-Quentin.

ROYAL ARCHÆOLOGICAL INSTITUTE.

(Continued from last week.)

Wollaton Hall.

ON Thursday, the 24th ult., according to the *Nottingham Guardian*, Wollaton Hall was selected to be visited.

Mr. J. A. Gotch, F.S.A., described the mansion. In dealing with the oft-quoted statement that Wollaton Hall is a typical example of the English Renaissance, he pointed out that this is erroneous. In its chief characteristics—its lofty central hall and four-cornered pavilions—it stands by itself, and in its extreme regularity of treatment and the care bestowed on detail it exhibits far more conscious effort in design than most of the houses built at that period. As to the all-important question of who was responsible for the design, Mr. Gotch remarked that so little is known through actual records of the architectural designers of that day or of their method of work, the field of conjecture is a large one. From the inscription over the garden door the house is known to have been built by Sir Francis Willoughby, begun in 1580 and finished in 1588. In John Thorpe's collection of drawings in the Soane Museum there is a ground-plan of the house and half the front elevation. There is also a monument in Wollaton Church to "Mr. Robert Smythson, gentleman, architect and surveyor unto the most worthy house of Wollaton and divers others of great account," who died in 1614 at the age of seventy-nine. Lastly, we learn from Cassandra Willoughby, Duchess of Chandos, who wrote an account of the house in 1702, that Sir Francis Willoughby "sent for the master workman who built the house out of Italy," and also for most of the stone figures which adorn the front. There has, said Mr. Gotch, long been an idea prevalent that the houses of Elizabeth's time owed their special characteristics to Italian workmen, but, as a matter of fact, it is extremely difficult to trace anything but a very small amount of English work to Italian hands. The tales of models being sent for from Italy are probably apocryphal, because the plan of English houses differs so widely from that of Italian houses. The chief credit for designing Wollaton should be given to John Thorpe, Smythson being clerk of the works. The meaning of many terms has changed since then, for a number of men described as "architectus" or "architector" were what we should regard as master masons, who in those days developed the ideas of the designer. In addition to the plans which Thorpe left, he is known to have studied a French book on architecture containing corner pavilions such as those at Wollaton, and other plans which he copied into his manuscript book he adapted to English ideas. Thorpe probably designed the plan and elevation, leaving Smythson and "the master workman from Italy" to carry them out. The plan of the building, although of foreign origin, is so contrived as to comply with old-established English habits. Contrary to the prevailing custom, however, Thorpe put his kitchen and servants' rooms down in a basement. This was almost a necessity of the design, for, being of a pretentious nature, it had to be grand on every side, and the inferior premises had to be hidden away. The disposition of the house, with a central hall surrounded by rooms two storeys high, necessitated an unusual height for the hall, which is over 50 feet high. The upper floor of these adjacent rooms on the east side is devoted to the long gallery, since divided into a number of small rooms. Duchess Cassandra tells us that the stone was brought from the Ancaster quarries on the backs of pack-horses, which took back Sir Francis's coal in exchange. The building, nevertheless, cost 30,000*l.*, which was an enormous sum in those days. The external treatment is of pronounced Classic character, with plenty of pilasters and bold cornices.

The members were conducted over the house by Lord and Lady Middleton. Lady Middleton takes a keen interest in everything relating to Wollaton. Wollaton fulfils one's idea of a baronial mansion, with its magnificent hall, fine stone screen, Elizabethan roof, minstrels' gallery and gorgeous staircase painted by Verrio. In the hall and other apartments are paintings by Rubens, Snyders, Lely and Kneller, many of the pictures being family portraits, including one of Sir Hugh Willoughby, who in the time of Edward VI. went, as Sir Henry Howorth recalled to the memory of his fellow archaeologists, to find the North-West passage, in company with those famous navigators Baffin and Hudson, and lost his life in the attempt, being subsequently found frozen with his crew. The cannon which were on his ship are still carefully treasured at Wollaton, along with a large array of firearms requisitioned at the time of the Reform Bill riots for the defence of the house. The "prospect room" over the great hall, containing a box with the coronation robes used by the Lord Middleton of Queen Anne's time, was visited. This splendid apartment measures 62 feet by 30 feet. The cellars also, which are cut for a considerable distance into the solid rock, aroused a good deal of curiosity. Out on the roof a glorious prospect of lake and woodland is obtained, a large part of Nottingham being plainly discernible. Before leaving Sir Henry Howorth thanked Lord and Lady Middleton for their hospitality.

Wollaton Church.

From the hall the party went to the church, opposite to which some masonry, now forming part of several old cottages, indicates the site of the ancient manor house occupied by the Willoughby family prior to the erection of Wollaton Hall. Fifteen years ago, as the Rev. H. C. Russell, the rector, said, the church was thoroughly restored. Before the restoration the arch under the tower was bricked up, with a little door in it, but the arch has now been opened out, with manifest advantage to the architecture of the building. Mr. W. H. St. John Hope gave some additional information concerning the church. The nave, the south door and the tower, he said, are of fourteenth-century work. The monuments are remarkable. On the north side of the altar is an enriched canopy, covering two fine brasses referring to Richard Willoughby and his wife. There is another beautiful canopied tomb on the opposite side of the chancel, containing the recumbent effigies of Sir Henry Willoughby and his four wives disposed around him. In addition there are a number of mural monuments, chiefly to the Willoughby family, but one on the south wall of the nave is devoted to the aforesaid Robert Smythson.

Sandiacre Church.

The archaeologists next drove on to Sandiacre, where they made their way up to the church, Mr. W. H. St. John Hope again acting as guide. The members seated themselves in the nave, and Mr. Hope, speaking from the pulpit, said that this little church had a history which could be made out pretty clearly. They knew for certain that there was a church there at the time when Domesday Book was compiled in 1080, but of that particular edifice there were no remains. In the present building there was nothing earlier than the Norman nave, the date of which was about 1120. The chancel was a fine example of fourteenth-century work. Mr. Hope concluded with a vigorous protest against any proposal to enlarge the church, as this would spoil it architecturally.

Strelley Church.

Strelley Church, the concluding object of the day's excursion, was next reached. Mr. T. K. Edge, of Strelley Hall, acted as guide. The tower of the church is of the thirteenth century, and the interior features of the edifice are a fine late wooden rood-screen, and some splendid monuments to the Strelley family, who, after being lords of the manor for generations, got into pecuniary difficulties in the time of Charles II., and had to sell the estate to Mr. Ralph Edge in 1684. The last of the Strelleys, it is said, was compelled to earn his living as a glass-blower—a sad end for such an illustrious race. The Strelleys were connected with the Willoughbys by marriage, and the combined arms of the two families are frequently to be met with.

In the evening a paper was read by Mr. C. R. Peers, F.S.A., upon "Saxon Churches of the St. Pancras type."

Arms of Nottingham and Colchester.

Mr. W. H. St. John Hope followed with a short paper on "The Arms of Nottingham and Colchester." He stated that he had before described the arms of Colchester, and he then said that a precisely similar shield, but with the cross vert was claimed as the arms of Nottingham, and was so entered in the visitation of 1569. He could not, however, find any other or earlier authority for them, nor could he see how they were to be interpreted or what possible connection they could have with Nottingham. Since those words were written he had become convinced that his former conclusions were untenable. He therefore submitted a new explanation of the interesting arms which would, he hinted, not only make clear the meaning of those of Colchester, but also show that the ancient town in which they were assembled might, with equal propriety, lay claim to similar arms. The question that arose was to whom did the crowns refer? A paper on ancient legends connected with the arms of Colchester had lately been put forth by Mr. Gurney Benham, in which it was said that they might assume that the arms of Colchester, as of Nottingham, were meant to tell the story of St. Helena, that the cross alluded to her discovery of the holy rood, that the three crowns symbolised the magi, and that their position was in all probability intended to remind men of the specially important discovery attributed to her, the discovery of the three holy nails. He (Mr. St. John Hope) was unable to accept that theory, but it had suggested to him yet one other, which he ventured to put forth, namely, that the three crowns had reference to and must be regarded as being associated with the three nails. This reduced the arms to perfectly simple elements—the brow of Our Lord pierced by three crowned nails. They might thus at once see why the lowest crown encircled the cross, because it then hovered over the third nail, and that the honour due to the hallowed nails which were otherwise liable to be overlooked was clearly and emphatically set forth by the crowns in a manner quite in accord with Mediæval usage. With regard to Nottingham, they could see their way very

clearly, since they need no longer try to associate with St. Helena, in whom Nottingham had no interest, arms which might equally well refer to Our Lord alone. Such a shield might, in fact, be regarded as the well-known emblems of the Passion reduced to the simplest elements. He confessed to still being without earlier authority than the visitation of 1569 for the assumption of these arms by the town of Nottingham, and in default of any evidence of the former existence of any relics of the true cross, or of the three nails, he could only assume for the present that it was by mere coincidence that the arms of Nottingham were identical with those of Colchester, for the illuminated initial showed that in both cases the cross raguly should be green, or what the heralds now called proper.

Annual Business Meeting.

On Friday morning the annual business meeting was held. The fifty-ninth annual report of the Council was read. This recorded a balance in hand of 190*l.* 12*s.* 10*d.*, which, compared with last year, showed an apparent decrease, but a further sum of 100*l.* had been added to the deposit with the bankers, so that the gross total indicated an increase of 91*l.* 16*s.* The membership showed that nineteen members had died, of whom nine were life members, and five had resigned. Thirteen new annual subscribers had been elected. Of those who had passed away, Mr. Arthur Cates and Mr. J. Park Harrison were especially noticeable. Mr. Park Harrison was one of the earliest movers in the revival of the practice of Gothic architecture. He was an indefatigable worker, and had contributed often to the proceedings of the Institute.

In regard to the place of next year's meeting, the following centres were suggested by members:—Tewkesbury, Tenby, Cardiff, Brighton, Oxford, York, Newport and Swansea. The final selection was left to the Council of the Institute.

The President said he would like to take the opportunity which that meeting offered of throwing out the suggestion that steps might be taken for the publication of the charters of Rufford Abbey, Newstead Abbey and Welbeck Abbey. In regard to the latter, he believed that the matter had only to be mentioned to the Duke of Portland to be undertaken. It was also suggested that the local authority should be asked to take steps for the preservation of Stapleford Cross, and the secretary was requested to forward these recommendations to the proper quarters.

Hardwick Hall.

The members spent the afternoon in visiting Hardwick Hall, where they were received by Lady Louisa Egerton. Before entering a brief view was taken of the beautiful gardens, which have been laid out under the direction of her ladyship. A halt was made in the entrance hall, and after the fine tapestries and other antiquities which meet the eye at every turn had been inspected, Mr. J. A. Gotch, F.S.A., prior to the tour of the interior, read the following description of the building:—

Hardwick Hall is a building of considerable interest to the student of English Domestic architecture, inasmuch as it is a good example of one manner of the Elizabethan designers, and it has undergone no very serious alterations since it was built. It has suffered, like most houses of that time, from age and from the changing fashions of its inhabitants; but such changes as it has experienced have been in comparatively small matters, so that in the general disposition of its plan and in its external appearance it remains to-day very much the same as when the eye of its founder, Bess of Hardwick, last fell upon it. This Bess of Hardwick was a notable personage, a woman of great ability and strong will, and, being possessed of considerable wealth, she left her mark upon the times in the shape of several large houses, of which this is one, and the only one surviving, the others being Chatsworth—which has been rebuilt—and Oldcotes. She was the daughter of John Hardwick, of Hardwick, and was born in the old hall, of which the ruins still remain in front of this house, near the brow of the hill. That she was a woman of great ability and personal attractions is sufficiently proved by the fact that she married four husbands and survived the last. The date usually assigned to the house is 1576. There is a chimney-piece in one of the bedrooms dated 1588, another in the dining-room dated 1597, and the door of the room called after Mary Queen of Scots is dated 1599. The new hall and the old hall stood side by side, and both were in use for many years. The old hall is, indeed, not much older than the new. Much of it has disappeared, but judging by what remains its general disposition was symmetrical, its windows, as can be seen, are mullioned, and have rectangular lights; its whole appearance points to a date about the middle of the sixteenth century. Tradition gives this house as the birthplace of Bess in 1520, and perhaps a careful search might reveal indications of a building of that date. But if anything of it still survives it certainly would seem as though the old house had been modernised during the second half of the sixteenth century, an additional proof being the remains of a plaster frieze, with figures modelled in relief, of the same character as the frieze in the presence-chamber of the new house.

Having been thus brought up to date, the old house was not left to immediate decay in consequence of the erection of its rival, for we learn from the ingenious Mr. Collins, who quotes Bishop Kennet's memoirs of the Cavendish family in his account of the Dukes of Devonshire, given in his "Peerage," that one room was of such exact proportion and such convenient lights that it had been thought fit for a pattern for a room in Blenheim House. It would be, therefore, well into the eighteenth century before the old house fell to ruin. It is not unlikely that the older house was the more comfortable of the two, for Hardwick Hall can hardly be considered as a model of convenient planning. It belongs to that species of house of which a large number were built in Elizabeth's days; a house designed as an exercise in symmetry rather than as a dwelling. True, it contains the apartments which were then considered essential, but they are arranged with less than the usual care to secure comfort and convenience. What must strike everyone who first sees Hardwick is the great size and number of the windows. This has given rise to the well-known jingle, "Hardwick Hall, more glass than wall." It is a fault common to many of the houses of the time, and one which Lord Bacon protested against in his oft-quoted complaint that "You shall sometimes have fair houses so full of glass that one cannot tell where to become to be out of the sun or cold." The fact that windows were so large and plentiful is one of considerable interest and significance, for it emphasises the complete change which had come over house-planning in the space of a few years. Thirty or forty years earlier windows were somewhat jealously introduced, especially on outer walls, for the necessity for defensive precaution had then hardly ceased. Here at Hardwick, however, no thought of defence is apparent; everything is done to procure the largest amount of light and air. The windows, in fact, are overdone; they make the circuit of the walls with relentless symmetry, and not a few of them have been blocked up inside in order to render the rooms habitable. Some of them were shams from the outset and have fireplaces against them, whilst not a few of them are crossed by floors, so that the lower lights belong to one storey and the upper to another. The room called after Mary Queen of Scots, which is situated high up on the second floor in one of the projecting turrets, has three of its sides on the exterior filled with windows; on the inside, however, only one side is lighted, the fireplace occupying the second side and the bed the third. The room is called after Mary, and has the arms of Scotland over the door, but there is no record of the exact length of her residence in semi-captivity in this house. Mary was beheaded in 1587, and as the door of her room is dated 1599, the probability is that it was adorned in her memory, evidently not for her own proper decoration. The house consists of a large oblong with two projecting turrets on each of the long faces, and one on each of the short faces. The door, as usual, is in the middle of one of the long sides, but the hall into which it gives access is not disposed in the fashion which had been customary up to this period, and which still prevailed in most Elizabethan houses. That fashion is followed in the halls of colleges; it placed the hall lengthways with the building, at the entrance end a strip was cut off by a screen and became a passage, called the "screens." At Hardwick the hall instead of being placed lengthways with the building goes across it from side to side. This unusual disposition may not seem of much importance, and it may be said that although the hall lies differently in relation to the house, yet all the usual features are there—the screens, the buttery-hatch and so forth. But the difference of arrangement, nevertheless, is indicative of a momentous change, and one which distinguishes Mediæval houses from modern. This alteration of character became thoroughly established in the time of Inigo Jones, and has remained to the present day. One of the tests of the age of a house is the disposition of its hall. In Mediæval times it was a living room; in modern times it is a vestibule. The hall at Hardwick, owing to its plan, is leaving the Mediæval type and approaching the modern. It may have had a dais, but probably not. Even if it had, that end had not the snug feeling of the old-fashioned arrangement, with its bay window and the fireplace fairly close to the seats of the chief personages. It must have been somewhat uncomfortable, as on each side of that end is a passage leading to a principal staircase. But, indeed, Hardwick may be said to have no "staircase"; it has, instead, long flights of steps. By "staircase" is meant a special feature, either of wood or stone, such as is the pride of most Elizabethan houses. But throughout the house the detail is disappointing; everything is large and coarse, including chimney-pieces and doorways. It is rather in its general disposition and the size of its rooms that Hardwick is interesting, for when one comes to examine the work closely there is an absence of that fancy and fertility of design which distinguishes the better class of work of that period. But although the means of getting upstairs are not very interesting, there are some fine rooms to go to. There seem to be no family rooms on the ground floor, unless they

have been turned from their original purpose. All the principal apartments are on the upper floors, and as each storey is unusually lofty, the whole height of the building is much greater than was commonly the case. The hall itself is two storeys high, and the only access from one half of the house to the other on the first floor lies across the gallery over the screens. The principal rooms on this floor are those now called the dining and drawing-rooms. In addition to these there are a few bedrooms, and various small apartments contrived to meet modern requirements. The finest apartments, however, are on the second or top floor, where are the presence-chamber and library, and the long gallery beside a fine bedroom and the room named after Mary Queen of Scots. Above these rooms, and partly in the roof, are a number of subsidiary bedrooms. The presence-chamber is a large and lofty room, with a very deep frieze of modelled and coloured plasterwork, representing hunting scenes. The quality of the work is not very high compared with what was being done in Italy and France at the same time; but it has considerable vigour, and imparts a fine and stately character to the room. Over the chimney-piece in the library adjoining is an alabaster panel of very considerable merit, representing Apollo and the Muses. The long gallery occupies the whole length of the east side of the house, and is a lofty and handsome room. It is the only apartment which retains its original ceiling, and as the ceilings of Elizabethan houses exhibited some of the most original and attractive work of the period, Hardwick suffers much from their absence. The rigid symmetry of the external treatment has already been referred to. It is as complete in its way as that of Wollaton, but the latter house derived more than symmetry from the Classic proclivities of the day. It also obtained the pilasters and niches with which its walls are adorned. Hardwick has none of these, and is an example of the fact that they were by no means necessary, although they were a very constant ingredient in the design of the period. The treatment of the windows here resembles in some degree that employed at Wollaton, or rather one should say, Wollaton followed Hardwick to a certain extent. In both places there is a projecting moulding or architrave which makes a framework round the window, and rests at the bottom upon a projecting sill, which is supported by small brackets. The mouldings of the jambs, mullions, and transoms, however, differ in the two examples. The cornices which divide the various floors have only a general resemblance, and the balustrade which crowns the walls is as meagre in the one house as the other. The finish of the turrets here is not so ambitious as at Wollaton, as instead of an elaborate, curly gable, there are only the Countess's initials and coronet supported by a Dutch flourish, a humble member of the same family which is so conspicuous on the towers at Wollaton. There are at Hardwick valuable accessory features which are now wanting at Wollaton, as well as at most of the houses of that time which have come down to us, viz. the garden walls and lodge. The lodge was almost as much a part of an Elizabethan home as the great hall and long gallery, but being of small size and detached from the main building, it has in the majority of cases been swept away in favour of some kind of landscape-garden effect. Happily it has escaped in this instance, and remains together with its supporting walls as an example not only of the manner of laying out the approach to an Elizabethan house, but also of the quaint and sometimes unworkmanlike way in which artificers treated their materials. In conclusion, Mr. Gotch left the domain of architecture to call attention to the great amount and excellent preservation of the tapestry which clothes the walls and vividly illustrates this method of decorating them, and also to the interesting furniture which survives in considerable quantity. These two things reconciled one to the absence of fascinating architectural detail, and helped to make Hardwick one of the finest examples of a large Elizabethan house.

"Robin Hood."

In the evening the members assembled in the Exchange Hall, under the presidency of Mr. R. Evans, J.P. A paper on "Robin Hood" was read by Mr. E. W. Brabrook. He said that Robin Hood had always been a popular hero. His history existed principally in the form of ballads. Of those there existed a great number. That sort of history was not likely to lose in the telling. The songs with regard to him were popular as early as 1362, but a more effective method was used to keep his memory green—that of the Morris dancers. They were popular in 1538, and the performances continued until 1592. Latimer complained that he wished to preach on a certain day, but the people would not hear him because it was Robin Hood's day. The popularity of the story as to him was further attested by the many places associated with his name to be found in Notts, Yorkshire and Lincolnshire. The Royal Forest of Sherwood testified to the bold and merry doings of Robin Hood, and he proceeded to relate several of the stories. Notwithstanding all his misdeeds, Robin Hood gained Court favours, Queen

Catherine sending for him. The many pranks he played would take an age to tell. He was a good outlaw, for he did poor men much good. Charity covered a multitude of sins. Such were the traditions, but what were the facts of the case? There were some who denied Robin Hood any real history whatever. He (Mr. Brabrook) ventured to dissent from that idea, and he should not be surprised if more than one Robin Hood did not exist. There was a strong English flavour about the ballads, and he did not know why it should be doubted that they had some foundation in fact. They need not deny his existence because they could not believe all his exploits. It seemed that he was born about 1160, and his career was a long one. The circumstances as to his noble descent were conflicting, and the probability was that he had no high extraction. The time would, however, never come when the Robin Hood ballads would not be sung. Mr. Brabrook next offered some remarks as to Robin Hood's companions, making special reference to Little John. He said he must give up the reality as to Friar Tuck, which was too improbable, and they must also not put too much faith in the story of Maid Marian.

(To be concluded.)

ST. PETER'S HOSPITAL, BRISTOL.*

THIS is one of the most interesting specimens of ancient Domestic architecture remaining in Bristol. All Domestic architecture of olden times was picturesque in form, and this gabled building will probably be admitted to be one of the most picturesque and characteristic now in existence. The original mansion is believed to have been erected about the end of the twelfth century by John Norton, and occupied the ground from the churchyard to the river. It remained in the possession of the Nortons for several centuries, and in 1435 it was bequeathed by Thomas Norton to his two sons, Thomas and Walter, by whom it was divided into two tenements. Walter is said to have resided in the western part of the building, and Thomas in the eastern part, and the latter is believed to be identical with one Thomas Norton, who, according to various biographers, was reputed the most skilful alchemist of his time, and claimed to have found out the elixir of life and the art of transforming metals, but who nevertheless appears to have died, and to have died in poverty. The premises continued in the occupation of successive generations of the same families till 1580, when Sir George Norton, who then owned the whole, and also the Manor of Leigh (Abbots Leigh) sold it to Henry Newton, afterwards Sir Henry Newton, of Barr's Court. It does not appear, though, to have become the habitation of any of the Newton family. The next known owner is stated in 1602 to be Robert Chambers, gentleman, by whom it was sold in 1607 to Robert Aldworth, a wealthy merchant, whose monogram is to be seen on the river front with the date 1612. At the date named this gentleman made considerable alterations and additions, practically rebuilding the house in the style of the period, for in a later deed now in the possession of the Guardians it is described as having been "by the said Robert Aldworth erected and new built." The street frontage, with its gables and arabesque enrichments, belongs to this date (1612), and the court-room is also a part of the alteration made by him. There is a very fine tomb in the adjoining church to the memory of Aldworth, who died in 1634. Although the principal part of the building was reconstructed by Aldworth, a portion of the churchyard frontage towards the east is part of the original building of the Nortons. From Aldworth's time it was occupied by various families as a private residence, and then became appropriated to trade purposes, being in that capacity first used as a sugar house. It is supposed that this is the place in Bristol visited by the diarist Evelyn, who in 1654 wrote, "Here I first saw the method of refining sugar and casting it into loaves." Then in 1696, on the Government determining to supplement the coinage at the Tower by the establishment of branch mints in some leading provincial towns, the civic authorities pressed the claims of Bristol, and being informed that provision of a suitable house must first be made at the cost of the citizens, it is recorded that the Corporation appointed a committee "to make a bargain with Sir Thomas Day for the Sugar House, and the house will find the way to pay the rent." The Sugar House referred to was this building, and it was occupied as a mint from 1696 to 1698. Finally, in 1698, it passed into the hands of its present owners, then known as the Corporation of the Poor. This body was established, under special Act of Parliament, in 1696, and was the first board of guardians formed in England. The Corporation of the Poor, finding in 1697 their workhouse inadequate, appointed a committee to select some other building, and this body reported in December that they found "none so fit or convenient for the purpose as

* A paper read by Mr. J. J. Simpson at the meeting of the Somerset Archaeological Society.

the Mint." Negotiations were opened, and in 1698 it was purchased for 800*l.* from Edward Colston, and others, and thereupon converted into a workhouse for the poor. The beautiful Jacobean sitting-room, erected by Aldworth, was fitted up by the Guardians as a chamber or court-room for their meetings, and has been used continuously since October 1698 for this purpose. This court-room is a sumptuous apartment, and the plaster ceiling is constructed in square and diamond compartments with floral and other devices, and the deep cornice has a running series of armorial shields supported by griffins. All this was time after time for a long period covered with whitewash, but twenty years ago this encrustation of white lime was carefully removed, and the entire ceiling emblazoned with colours and gold leafage in supposed accord with the original designs. Over this Jacobean ceiling there exists a fine open-timbered Gothic roof of fifteenth-century date, which appears to have been the canopy of the great hall of the mansion before the reconstruction in 1612, and probably extended from back to front of the building. The entire premises are now occupied for administrative purposes only by the Guardians, who, finding the court-room too small for their larger numbers and greatly increased work, are now erecting a new board-room in the south-western portion of the building, but the present apartment will remain intact.

DERBYSHIRE ARCHÆOLOGICAL SOCIETY.

THE members of the above Society made a presentation on the 29th ult. to Mr. Arthur Cox on the occasion of his recent marriage and in recognition of his services as hon. secretary of the Society for nearly twenty-three years. A ready response was made to the invitation for subscriptions, eighty-nine members replying, and a handsome silver salver was purchased, engraved with Mr. Cox's coat-of-arms and a suitable inscription. The presentation was made by the Hon. Frederick Strutt, vice-president of the Society, who in a suitable speech pointed out how much the Society was indebted to Mr. Cox, who had been hon. secretary since its inception in 1878, and had done much to raise it to its present flourishing and important position.

Mr. Cox, in his reply, expressed the thanks of himself and Mrs. Cox to the members of the Society, and stated the pleasure and interest he had taken in the work, which nothing but the pressure of other duties would have caused him to relinquish.

BIRMINGHAM ARCHÆOLOGICAL SOCIETY.

THE Birmingham Archæological Society made an excursion to Gloucester and district on the 31st ult., and under a combination of pleasant circumstances the day proved most enjoyable and successful. The party reached Gloucester about 10.45, and at once proceeded to the cathedral, where an hour or more was spent in examining the many interests of this beautiful and well-known edifice. Thence a brake conveyed the members to Ashleworth, where an interesting group of buildings is to be found close down to the river Severn—the Court and its various outbuildings and huge barn, the church, with its west-end tower and spire, and the churchyard cross. The church and the cross in the churchyard were first inspected, and then, by the courtesy of Mrs. Clarke, the Court was examined. It is a structure of late fourteenth-century or early fifteenth-century date, originally having finely proportioned and lofty apartments enriched with open timber roofs, but is now cut up with modern floors and partitions. After examining the fifteenth-century (or late fourteenth-century) barn, the party drove on to the old vicarage, where Miss Fuljames most kindly permitted its inspection. It is a delightful, half-timbered house, in date about the end of the fifteenth century, and has its porch, gables and walls all of fine oak framings, moulded and enriched and in excellent preservation. By a small detour Hasfield Church was next visited, and then, by the courtesy of Miss Surman, the Great House, another interesting example of Mediæval domestic work of varying date and detail. Deerhurst Church was the next place reached, and its most notable Saxon tower and other details were carefully examined. Then the Saxon chapel of Duke Odda, of eleventh-century date, was inspected. It is partly incorporated in a half-timbered farmhouse not far distant from the church, and is an interesting relic of that pious and church-serving duke. Having taken tea at the farmhouse, the party drove into Tewkesbury, and caught the 8.33 train to Birmingham, after one of the most enjoyable excursions of the season.

The Plans for a central fire station in Durban, South Africa, are to be submitted to public competition, and a premium of 50*l.* is to be awarded for the best design.

GENERAL.

Mr. Walter Merrett has had the honour of submitting to the King the clay model of the marble bust he is executing for Mr. T. V. Bowater, C.C., for presentation to the City Corporation, and was favoured by His Majesty with a sitting.

Battle Abbey was opened last week for the first time since the death of the late Duchess of Cleveland. A small charge for visiting the Abbey is now made. It has been arranged that the Abbey can be visited on other days at a higher charge.

The Greek Ministry of Public Instruction has addressed the British Government, requesting it to express the thanks of the Greek Government to Mr. Seton-Karr for his gift to the Athens Archæological Museum of 140 ancient instruments of various descriptions, which are of great value.

Mr. H. Andrews has purchased the domain of Toddington, comprising about 7,000 acres, and formerly the property of Lord Sudeley. The mansion is a fine example of Gothic architecture, and cost upwards of 150,000*l.* The property is rich in historical associations. The ruins of the ancient abbey of Hailes are upon it, and it was here that Richard, Earl of Cornwall, King of the Romans, founded a Cistercian monastery in 1246.

Mr. John Palfreeman, who has been resident engineer at the Houses of Parliament for about three years, died last week after a few days' illness. Before his appointment at Westminster he was chief engineer at the Royal Courts of Justice. He was in his fifty-ninth year.

Mr. James Hawke Dennis, of Great Hurst Park, Surrey, who has provided the necessary funds for completing the Victoria Tower of Truro Cathedral, has presented a new organ and peal of bells to St. Buryan Church, near Penzance. The bells are from the works of Messrs. J. Warner & Son, of Cripplegate, and the organ from Messrs. Hart & Son, of Truro. The large bell has the following inscription:—"Edward VII. This bell was given by James Hawke Dennis, a benefactor of St. Buryan Church, to commemorate the accession of King Edward VII., A.D. 1901."

The Greek Pavilion from the Paris Exhibition, designed after the Byzantine Church of the Pantanassa at Mistra, is to be erected at Athens as the Church of the Saviour, on the spot where the attempt was made on the lives of King George of Greece and Princess Marie three years ago.

The Bristol Town Council have given their final approval to the Docks Bill, which has passed both Houses of Parliament, this form being necessary before the Royal Assent could be obtained. The present cost of the scheme is estimated at 1,950,000*l.*

The Board of Education (Secondary Branch) announce that the Museum of Practical Geology, Jermyn Street, will be closed as usual from the evening of August 9 until the morning of September 10.

The Housing Committee of the Westminster City Council have reported that they inspected several sites which might be suitable for providing accommodation for the working classes in the city. The committee were of opinion that a vacant site, about an acre and a half in extent, in Regency Street, part of the Westminster Chapter estate, was one suitable for the purpose, and as an initial step they recommended the Council to make an offer to the owners, the Ecclesiastical Commissioners, to purchase the land for the sum of 32,000*l.* The Council adopted the recommendation of the committee.

The West Ham new lunatic asylum at Chadwell was opened on Thursday in last week. The building provides accommodation for 800 patients, and has been erected at a cost of over 300,000*l.*

The York Council have under consideration a scheme for the improvement of a street near the Minster. Numerous experts have communicated with the authorities warning them that almost certain damage will be caused by vibration if heavy traffic be allowed to approach the building.

The Royal Hibernian Academy have elected Mr. Oliver Sheppard, sculptor, and Mr. Henry Jones Thaddeus, portrait painter, as members.

The Bishop of St. Asaph, at a meeting of the St. Asaph Diocesan Societies last week, expressed his willingness to take the risk of avoiding the expense of a second survey by appointing a commission to give their judgment upon the surveyor's first report.

Messrs. P. S. King & Son have in the Press for publication during September a work by Dr. J. F. J. Sykes on "Public Health and Housing," being the Milroy Lectures delivered before the Royal College of Physicians in February and March last.

Heaton Park, Manchester, containing 686 acres, has been purchased from Lord Wilton by the Manchester City Council for 230,000*l.*

THE Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—Sept. 16.—Competitive plans are invited for the laying-out of land to be added to the cemetery, with specifications, descriptions and estimates. Premiums of 30*l.*, 15*l.* and 5*l.* are offered. Mr. T. Loftos, town clerk, Town Hall, Blackpool.

CAMBERWELL.—Oct. 29.—Plans are invited for public baths and washhouses to be erected upon a site in the Old Kent Road. Premiums of 150, 75, and 50 guineas respectively are offered. The Town Clerk, Town Hall, Camberwell, S.E.

CHELSEA.—Oct. 1.—Competitive designs are invited for proposed new baths in King's Road, Chelsea. Premiums, 100 guineas, 50 guineas and 30 guineas respectively. Particulars at the office of the committee, 171 King's Road, Chelsea.

PENZANCE.—Sept. 1.—Competitive plans and estimates are invited for laying-out ground situate on the Western Promenade, to include a winter garden suitable for band and other concerts, and lavatory accommodation for ladies and gentlemen. Premiums of 21*l.* and 10*l.* 10*s.* respectively are offered for the best and second best designs. Mr. T. H. Cornish, town clerk, Public Buildings.

CONTRACTS OPEN.

AISH.—Aug. 15.—For erection of a farmhouse at Aish, South Brent, Devon. Mr. Thomas W. Pearse, surveyor, Stolford, Modbury.

ARGENTINE REPUBLIC.—December 10.—For construction of harbour works at Rosario. Particulars can be obtained at the Commercial Department Foreign Office, S.W., on personal application.

AUGHTON.—Aug. 22.—For erection of a new pavilion at the isolation hospital at Aughton, Lancashire. Messrs. William Rawcliffe & J. A. Seward, architects, Fishergate, Preston.

BATLEY.—Aug. 21.—For erection of buildings and chimney-shaft for the Corporation electricity works. Mr. J. H. Craik, town clerk, Batley.

BENWELL.—Aug. 12.—For erection of the new Benwell Board school. Mr. J. W. Thompson, architect, 63 Gray Street, Newcastle-on-Tyne.

WROUGHTON.—Aug. 17.—For rebuilding the Three Horse-shoes inn, Wroughton. Messrs. William Drew & Sons, architects, 28 Regent Circus, Swindon.

ANSWERS TO CORRESPONDENTS.

ARCHITECT'S FEES.—(H.E.H.)—(a) There was a clerical error in the reply to the legal inquiry in last week's *Architect*. The charge for obtaining tenders should be $\frac{1}{2}$ per cent. extra, not $2\frac{1}{2}$. The mistake was caused by one of the copying clerks.

NOTICE TO QUIT.—(Tenant).—Although you pay rent quarterly your tenancy is clearly an annual one, and you must give six months' notice to leave, such notice expiring at the date you entered.

An interesting archaeological search has just been concluded at a tumulus on the property of Mr. H. J. Smith-Bosanquet, at Hoddesdon, Herts. An excavation was made right into the centre of the mound, when a basin-shaped hollow about 15 feet across was found. In the middle of the hollow was charcoal of wood, and it is thought of bone also. The results of the search point to a cremation on a big scale, apparently on the level surface of the ground, the remains being afterwards covered with a mound of earth dug from all round the spot, and leaving it surrounded by a trench of considerable depth.

THE CUNDALL PATENT OIL ENGINE

COPY OF LETTER.

THE GREAT WESTERN HOTEL,
OBAN: October 29, 1900.

DEAR SIRS,—I have very great pleasure in testifying to the efficiency of the 20 B.H.P. Oil Engine which you supplied for driving the Dynamo, which gives current of equal H.P. for lighting and Motors in the Hotel. The Engine has now been in use almost daily for over three months, without the slightest hitch. It gives the utmost satisfaction and the most favourable results.

Practical men who have seen the Engine working pronounce it to be the best and smoothest working they have seen.

What I think is one of the features of your Engine is that my man can start it without any assistance. Most Oil Engines I have seen were difficult to start, taking three, four, and sometimes six men to start them.—I am, yours faithfully,
ALEX. MCGREGOR.

A NEW SAFETY WINDOW FITTING.

THE frequent occurrence of accidents arising from that obviously dangerous but apparently only method of cleaning windows by sitting or standing upon the sills, although long calling for some system of fitting windows that will entirely obviate the necessity for the continuance of this practice, has not yet led to any general adoption of what are known as "safety" windows. And although the by-laws recently made by the London County Council, which provide for a penalty from "any person ordering or permitting anyone in his service to stand on the sill of any window for the purpose of cleaning such window when above 6 feet from the ground immediately below it without sufficient support to prevent such person falling," and also from any person who is engaged in this act, have led to a fair amount of inquiry for "safety" windows, there have been, so far as we can judge, but a very small percentage fixed.

It has not been, however, so much the absence of these by-laws that has hitherto prevented the more general use of "safety" windows, but rather that the experience of those who have adopted many of the patents brought before the public has, unfortunately, been that from one cause or another they have proved unsatisfactory. There has, therefore, naturally been a desire to see something more practicable before deciding to experiment with others.

Another reason for their rather infrequent use has been the increased cost. In applying them to houses in the course of

erection owners naturally hesitate to incur the extra outlay on fixtures that might not be appreciated by the tenants, and the householder is unwilling to spend money on a house he may be leaving at any time. But we believe that a "safety" window which is safe, with an absence of intricate fittings and scarcely costing more than the ordinary kind, would be readily taken up, and that fittings which could be applied to existing windows without damaging in any way either the window or the walls, which are easy of attachment and, above all, moderate in price, would not fail to induce owners to supply and householders to adopt this very necessary safeguard.

Before giving a description of the "All England" safety window fittings, which we have carefully inspected and tested, we would call our readers' attention to the advantages they possess and which overcome the objections we have mentioned. One of the most important is that they can be fitted at a trifling cost to any ordinary window, enabling it to be raised or lowered at all times in the usual manner or opened into the room, so that the outside of the window can be cleaned, and without the use of steps, for the upper sash. When applied the windows are made rigid and rendered weathertight. Once fitted the "A. E." require no attention or outlay for upkeep, and, as will be seen later, are so simple that they can be operated by any domestic servant. The only alteration necessary to existing or new window frames is that the beading and the batten on one side must be hinged to enable the window to be swung into the room. This is held in place when not in use by means of a spring. Briefly described, the fittings and method of fixing the "A. E." are as follows. Two rods are fixed on the frame of the window, the one opposite the upper sash being on the parting-bead, and the one against the lower on the batten. These are held in position by brackets. At the sides of the sashes are fixed other brackets, through which the rod passes. When the upper sash is pulled down, the brackets coming together form the hinge on which the window swings, and the lower sash, when closed, holds the brackets in proper position.

The accompanying section will readily explain the system.

A, Sliding Bracket; B, Fixed Batten-rod Bracket; C, Parting-bead Bracket; D, Rod of Hinge; E, Roller with Strap-iron on Pulley stile; F, Spring; G, Batten Rod-hinge; H, Parting Bead-hinge; I, Sash-weight.

The fittings are well and strongly made, and while sufficient for carrying the heaviest sashes, are in no way clumsy or unsightly in appearance. The bracket used for the separating

bead on the upper sash is rivetted into a metal back-plate, as well as screwed into the pulley-stile, and can be relied upon to be always secure, notwithstanding that the bead gives such small holding surface. After they are fixed all that is necessary to swing the window into the room is to press down the spring, F, fold back the batten rod, raise the window slightly and turn it on its hinges.

This is effected by the windows having the fittings attached, the top batten of the window frame being hinged and acting as an automatic flap, which when the casement is raised turns inwards, allowing a current of air to pass as well as through the space left at the bottom. It is necessary to attach a sash weight as in the ordinary windows, to keep them in position when raised.

The "All England" Window Fittings Company, of 13 Victoria Street, S.W., who are now placing these fittings on the market, have also adapted them to French casements, by means of which, while acting in every respect in the ordinary way, they can be slightly raised to give ventilation without the objection of too much wind being admitted, causing doors to slam and the contents of the room to be blown about.

Taking into consideration their simplicity, the ease with which they are fixed and operated, and the absence of any parts liable to be damaged, we believe the "A. E." fittings are worthy of the attention of architects and owners of property and householders, and that they are not only a safeguard against personal accidents, but afford a simple solution to the difficulty of cleaning windows, no matter in what position they may be.

NO HOUSE, OFFICE, or FACTORY SHOULD BE WITHOUT A RELIABLE & GERM-PROOF FILTER.

Dr. ANDREW WILSON writes as follows:—"The filters sold by the Berkefeld Filter Co., Limited, London, W., remove all germs from water. They therefore represent ideal filters, giving pure (*i.e.* germless) water, and thus prevent typhoid fever and many other diseases."

**SIMPLE IN CONSTRUCTION,
MOST EASILY CLEANED.**

TRADE NOTES.

THE isolation hospital, Rochford, is being warmed and ventilated by means of Shorland's patent Manchester grates by Messrs. E. H. Shorland & Brother, of Manchester.

THE heating of the new Peel Brow Board schools for the Walmersley and Ramsbottom School Board is to be by Spencer's patent "Ventilo" radiators, of which the patentee and sole maker is Mr. W. F. Spencer, Cross Bank Works, Oldham, and 145 Queen Victoria Street, London, E.C., who is installing the apparatus.

A NEW clock and chimes has been erected at the parish church, Waddington, West Clitheroe, showing the time upon two large external dials. The clock was set going at twelve o'clock noon, August 1, by Master James Walmsley, son of the late Mr. Walmsley, New Hall, Waddington, to whom the clock has been erected as a memorial by his widow, Mrs. Lois Walmsley. The work was carried out by Messrs. W. Potts & Sons, clock manufacturers, Leeds.

THE new schools for the Hendon (London) School Board at Burnt Oak, Bell Lane, Algernon Road and Child's Hill are ventilated and warmed on Key's improved "Plenum" method, whereby the air, after being filtered and warmed in winter and filtered and cooled in summer, is propelled into the rooms and halls in such volume as will renew the air from seven to fourteen times per hour positively, and without draughts, the designing of the scheme and the whole work of fitting up the apparatus, including steam boilers, gas-engines and air-propellers, &c, being carried out by Mr. William Key, of London and Glasgow.

VARIETIES.

THE church at Llanddowror, which has been restored as a memorial to the Rev. Griffith Jones, was reopened on the 1st inst.

MR. HENRY SAGAR, assistant town clerk of Lancaster, has been appointed deputy town clerk of Richmond, Surrey, in succession to Mr. H. A. Millington, the newly-appointed town clerk of Great Yarmouth.

THE new Wesleyan chapel and schools at Monkton Hill, Chippenham, are to be erected from designs by Mr. R. Curwin, architect, of London. It is proposed to build the schools first,

and they will contain eight classrooms. The work will not be started until early next year. The total cost will be about 6,000*l*.

THE dispute in the slating branch of the Bolton building trade, which has extended over about fifteen weeks, has now been arranged, and the men resumed work on Monday last. About seventy slaters engaged by seven or eight firms were affected by the strike. The plumbers' dispute is referred to arbitration.

IT is officially stated that a contract has been concluded between the Mersey Railway Company and the British Westinghouse Electrical and Manufacturing Company for the construction of the works necessary to enable the Mersey Railway to be worked by electric traction.

THE Local Government Board has given its sanction to the proposed new electric-light works at Eastbourne, and has given the Corporation authority to borrow for that purpose sums of 43,287*l*. and 7,500*l*., the former for a period of twenty-four years, and the latter, which is expected to be realised within the next two years by the sale of the present generating station, in two years only.

DURING the course of excavations at Caersws, near Llanidloes, for a new house, the workmen discovered a Roman well 12 feet deep and 3 feet wide, containing 3 feet of water. The well, which is in a splendid state of preservation, is situated within a few yards of Caersws railway station, on the boundary side of the Roman encampment at one time in Caersws district.

At a new building on the Quayside for Messrs. Pyman, Bell & Co., shipowners, Newcastle, on Wednesday, a workman stumbled on a platform at a height of 40 feet. The son of the builder, Mr. Maughler, was close to him at the time, and the man, in falling, clutched young Maughler, and both were precipitated to the ground. The workman was killed on the spot, but the other escaped without hurt, he having fallen on the one who stumbled.

THE excavations for the foundation of the new Gaiety Theatre are now almost complete, and the foundation-stone will, it is hoped, be laid in a few days. The new house, which is situated at the western or Waterloo Bridge spur of the new street between Holborn and the Strand, will be ready by the autumn season of next year, and it has been arranged that the present Gaiety shall not be pulled down till the new theatre is opened. Attached to the house will be an hotel as well as the Gaiety restaurant and the well-known Short's new habitation.

Are invited to write for Samples and Prices of
the Asphalt supplied from the Company's
Freehold Mines in the SEYSEL Basin.

5 Laurence Pountney Hill, Cannon St., F.C.

SINCE the opening last year of the new court-house and police-station at Halifax, alterations have been in progress of the interior arrangements at the Town Hall. Amongst them has been the adaptation of the old police-court as a new council chamber. There is a stained-glass ceiling. The new chamber will probably be ready for occupation for the October meeting of the Town Council.

THE last stage in the construction of the north pier at the mouth of the Wear has now been entered upon, the caisson to form the round head having been sunk into its place. When both piers are completed another harbour of refuge on the north-east coast will have been formed, while the depth of water at the entrance to Sunderland harbour has been very considerably increased. The caisson is 101 feet by 96 feet, has a depth of 26½ feet, and was sunk at a depth of 23 feet below low-water mark. It rested on a bag-work cement foundation, the bottom of the bag-work being at a depth of 55 feet below low-water mark. The caisson weighed 3,000 tons; and when completely filled with concrete blocks and granite rubble will weigh 10,000 tons. Upon this will be built the superstructure with ordinary granite-faced blocks of cement, varying in weight from 43 to 57 tons, and on the top the lighthouse. The total weight of the round head will be about 28,000 tons.

THE Institution of Junior Engineers will hold a summer meeting at Plymouth and Devonport, August 12 to 17. Visits will be paid to H.M. Dockyard, Devonport, H.M.S. *Cambridge* (gunnery ship) and H.M.S. *Defiance* (torpedo school ship), Keyham Dockyard Extension Works, Keyham Steam Yard and Royal Naval Engineering College, Royal William Victualling Yard, Saltash Tubular Bridge and other works and places of engineering interest in the neighbourhood. The summer dinner of the Institution takes place at the Hôtel Continental, Plymouth, on Friday, August 16.

THE new hall at Larbert, built and presented to the district by Major Dobbie, was formally opened on the 5th inst. by the Duchess of Montrose. The new building is commodious and comprises both a large and a small hall. The latter is to the front and has accommodation for about 200 persons. The main hall, which is lighted by ten largewindows, accommodates 700 persons below and 300 persons in the gallery which runs round three sides of the building. There is a wide recessed platform at the end, framed in by an ornamental archway and flanking pillars. The high ceiling is divided into panels, from which the gas pendants for the artificial lighting are suspended. Adjoining the platform are retiring-rooms and other accommo-

dation. To the right of the main entrance of the building there are also cloak-rooms, ladies' retiring-room, and a kitchen with a lift to the service-room on the floor above. The architects were Messrs. A. & W. Black, Falkirk.

AT a sitting of the Consistory Court in York Minster, Rev. G. Trundle, surrogate, acting on behalf of Mr. C. A. Cripps, chancellor of the diocese, granted the following faculties:—To the vicar and churchwardens of Ackworth, to rebuild the roof of the nave, to build a clerestory and make certain other alterations; to the vicar and churchwardens of Marske-by-the-Sea, to take down the west wall and rebuild it at the extremity of a proposed addition to the churchyard; to the vicar and churchwardens of Skipton Thorpe, to erect a lych-gate at the entrance to the churchyard; to the vicar and churchwardens of St. Augustine, Sheffield, to insert stained glass in the east window in memory of William Fisher Fovell, erected by his daughter; and to the vicar and churchwardens of Clifton, York, to build a new vestry on the north side of the organ chamber and a porch on the west side of the north transept, thereby making a new entrance at that point.

THE new workhouse for Wolverhampton which is being erected at New Cross, Wednesfield, has been visited by a number of members of the Board of Guardians and their wives and many of the leading residents of the neighbourhood to inspect the progress of the work. Mr. A. Marshall, the architect, of Nottingham, with Mr. Smyth, the clerk of the works, conducted the party over the various buildings, which practically cover about six acres. The total area of the sites is 50½ acres, about 40 acres being utilised as airing grounds or for cultivation. The cost of the land was 11,128*l.*, while the contract for the buildings was placed with Messrs. Fish & Sons, of Nottingham, whose tender for the whole of the work reached 156,879*l.* The latter sum, however, is not inclusive of the cost of furniture, road-making and the cost of the greater part of the boundary walls. Provision will be made for 1,142 officials and inmates, the former numbering sixty. The main buildings are set well back from the road, and parallel to it, in the centre of which will be found the administrative offices, dining-hall, stores, &c., and a little in the rear the engine-house, laundry, workshops, &c. The infirmary pavilions are some distance in the rear of the main building, while provision for a resident medical officer is to be found in the centre. The pavilions are connected on the ground floor by enclosed corridors, the roofs of which provide means of communication between the upper wards. Contiguous to the infirmary pavilion

on the right is the nurses' home, which will contain mess-room, sitting-rooms, library, &c., on the ground floor, and twenty bedrooms. An isolation hospital to accommodate two males and two females, and rooms for a nurse, are placed near the boundary of the site on the right and furthest from the road. The contract with the builders was dated December 4, 1899, and the buildings are to be completed in three and one-third years from that date.

BUILDING AND BUILDERS.

THE Metropolitan Asylums Board invite tenders for the erection of four seaside homes for children at Rustington, near Littlehampton, Sussex, according to drawings by Mr. Rowland Plumbe.

THE foundation-stones of the new Sunday school adjoining the Baptist chapel at the pretty little village of Littleover (Derbyshire) were laid on the 31st ult. The new building, which will consist of one large room, will cost about 190*l*.

THE ceremony of laying the foundation-stones of the new Sunday school room which is to be erected at the rear of the Wesley English church, Pontmorlais, Merthyr, over the Morlais Brook, took place on the 1st inst. The cost of the proposed structure will be 975*l*. The architect is Mr. W. Jones (Messrs. Williams & Jones), and the builder Mr. S. Hawkins.

MR. F. H. TULLOCH, one of the Local Government Board inspectors, held an inquiry into the application of the Farnborough Urban District Council to borrow 20,000*l*. for the purpose of sewerage and sewage disposal. The clerk having given statistics and particulars as to the needs of the district, the inspector proposed to visit the site, and afterwards to go into details with the surveyor, and report thereon to the Local Government Board.

THE foundation-stones of the block of public buildings to be known as the Camberwell Institute and Baths, in Wells Street, S.E., close by St. George's Church, near the canal, have been laid by the Lord Mayor. The land was given for the purpose by Lord Llangatock. The entrance to the public library is in Neate Street, the porch leading into a top-lighted central hall, where the borrowers' space faces the vestibule beyond the arch below the dormer gable. To the right is the news-room and to the left the reference-room, with the lending library to the rear—all these departments being divided by

glazed screens. In the basement are stores, staff-room lavatory and w.c. accommodation for the librarian's use. The baths include fifty slipper-baths, the women's two classes being on the first floor. The office is central and the ticket clerk can serve all four departments as well as the laundry. The wash house accommodates thirty places, and to the front are the mangling-room, bonnet-room and stairway to basement. The establishment laundry is placed in the basement, with engineer's shop, boiler-house, messroom and other conveniences. Mr. H. L. Holloway, of Union Works, Deptford, is the general contractor. The contract, exclusive of engineering works, is between 18,000*l*. and 19,000*l*. The elevations are in red brick with Portland stone and Hopton Wood stone dressings. Glazed brick is extensively used inside and Broseley tiles for the roofs. Norwegian granite will be used for the bath entrance. Messrs. Maurice B. Adams and William Oxtoby are the joint architects. Mr. J. Lake is the clerk of works.

THE Duke of Portland has laid the foundation-stone of a church which is being erected at East Kirkby, Notts, at a cost estimated at 5,000*l*. The building will consist of a nave 78 feet long and 27 feet wide internally, with aisles (merely passages 4 feet wide), a chancel 30 feet long and 21 feet wide, vestries for clergy and choir, with heating chamber under and bell turrets at the west end. The principal entrance will be at the west end facing Lowmoor Road, the highway between Nottingham and Mansfield, and an internal porch will be formed by a screen and swing-doors. The style of architecture is English Gothic of the early fifteenth century, and the church is planned to accommodate about 360 adults, and to admit of lateral extension by increasing the width of one or both the aisles according to future requirements. The nave and aisles are divided into five bays, with octagonal stone columns and moulded arches springing from the piers without capitals. The chancel arch will be enriched with carving. The roofs will be of open timber construction, with hammer-beam trusses, the wood being stained dark walnut colour. The floor under the seats will be of wood blocks, and in the passages, &c., of "terrazzo" and marble mosaic. The walls will be of brick, with red facings and stone dressings externally, and plastered and distempered internally, except where stonework is used. The windows will be of stone, the arched heads being filled with tracery, that of the large west window being of a rich character. The glazing will be of leaded cathedral glass in small quarries. The roofs will be covered with red tiles and the turret roofs with lead. The

heating will be by means of hot water on the low-pressure system, with pipes chiefly above the floor level, and occasional radiators. The ventilation will be by means of hopper casements to some of the windows and ventilating tiles in the ridge of the roof. It is intended to have the choir seats and clergy stalls of oak, and the general seating of pitch pine stained brown. Space for an organ is provided between the chancel and vestry. The architect is Mr. Louis Ambler.

ELECTRIC NOTES.

A SPECIAL service has been held in St. Lawrence Jewry, Gresham Street, to inaugurate the installation of the electric light in that church.

THE electric-lighting and power committee, in their monthly report to the West Bromwich Town Council, state that they have been waited upon by a deputation from the West Bromwich Tradesmen's Association asking for a reduction in the prices charged for current for lighting purposes, and after carefully considering the matter they recommend that the alternative charges from April 1 to September 30 be on the basis of a flat rate of 4d. per unit, and further, that the maximum demand system be continued from October 1 to March 31 at the present rates. They also recommend that customers be allowed the option of paying upon either the maximum demand or the flat system during the summer quarters by giving notice of such intention in April. They further recommend that a flat rate of 4d. per unit all the year round be fixed as the charge for electric current supplied for lighting churches and chapels, which is in accordance with the practice in other towns of making special rates for places of worship.

A MOVEMENT for the introduction of electric lighting into North Berwick has been on foot for some time past, the Town Council having been in correspondence with a London firm regarding the matter. The Board has provisionally adjusted an agreement with that firm for the supply of electric energy for the burgh. Under that agreement the firm in question is bound at its own expense, within eighteen months of the Town Council obtaining a provisional order, to erect and completely equip the necessary plant, with all modern appliances for the supply of electricity within the burgh, and is bound to carry on these works for at least twenty-one years, unless they are

sooner acquired by the Council. Satisfactory terms for the acquisition of the whole works at varying periods by the Town Council have been adjusted. The community are now being asked by plebiscite if they are in favour of the supply of electricity to the burgh by the said firm, or if they would be in favour of carrying out the whole scheme by the Town Council themselves.

NEW CATALOGUES.

MESSRS. BARFORD & PERKINS, of Peterborough, take the opportunity afforded by the issue of a new and up-to-date catalogue to draw the attention of managers of all large establishments, public and private, county councils, boards of guardians, workhouse masters, &c., to the efficiency of their improved steam-cooking, heating, laundry and drying apparatus, for which they claim a large amount of merit from the point of view of economy, cleanliness, simplicity and expedition. The catalogue contains numerous illustrations of the various appliances and of actual installations where they are employed, as well as a lengthy list of testimonials from those who have them in use.

FROM Messrs. Saunders & Taylor, Ltd., of Manchester, we have received an illustrated price list relating to their "Waverley air inlet ventilator," a good point about which is the efficacy of the filter. The front valve of this ventilator, which is made with embossed metal fronts, carved hardwood fronts and plain hardwood fronts, can be easily removed for cleaning, &c.

ST. NINIAN'S CATHEDRAL.

A DEDICATION service has been held in St. Ninian's Cathedral, Perth, in connection with some considerable extensions, inclusive of a chapter-house, which have just been completed. The present additions do not quite mark the completion of the full architectural scheme for a cathedral in Perth as it was originally drawn up more than fifty years ago; but they go a long way towards that consummation, and they go far enough to make St. Ninian's Cathedral, as it now stands, one of the most complete and handsome places of public worship of its size north of the Tweed. The church, as originally opened in 1850, consisted of choir, dwarf transepts

47 STRAND, LONDON, W.C. (FIRST FLOOR).

and one bay of the nave; forty years later there were added three new bays to the nave, along with the transepts, and the space under the proposed tower; and now the choir has been extended internally across the transepts, a new episcopal throne, canons' and choir-stalls and pulpit have been provided, vestries for bishop, clergy and choir have been erected, and, not the least important of all, a tastefully-designed chapter-house has been built as a memorial to the late Bishop Wordsworth, who presided so long and so honourably over the diocese. For the remodelling and the furnishing of the chancel the same style of architecture has been adopted as that in which the rest of the structure had already been built, namely, Early Middle Pointed; but for the additions—the chapter-house, vestries and cloister—recourse has been had to what is known as "Jacobean Gothic." Into one of the walls of the chapter-house has been inserted a memorial tablet bearing a Latin inscription, of which the following is a translation:—"In pious memory of Charles Wordsworth, for almost forty years Bishop of St. Andrews, and for the use of the chapter of this church, this house built by his friends and dedicated to God, 1901. Here let the hope and clear faith of the clergy shine. Here ever let there be heard from the choir of the brethren Christian truth spoken in love." The present extensions, together with the cloistered passage from which access to the new apartments is obtained, represent an outlay of about 13,000*l.*, and bring up to about 20,000*l.* the amount which has been expended upon the church buildings within the past ten or twelve years.

FORESHORE PROTECTION.

A PAPER on "Foreshore Protection" was read by Mr. R. G. Allanson-Winn, M.I.C.E., of Dublin, at the Health Congress, Eastbourne. He first emphasised the fact that any methods or devices which tended to safeguard and improve the general condition of seaside health resorts conferred distinct benefits on hundreds and thousands of city toilers who annually seek a renewal of health and strength at those watering-places. Of the two chief means employed for the protection of the coast line from sea encroachment—groynes and sea walls—the former were probably the most important, since by their judicious application they might dispense with costly sea walls, induce the sea to do much of the work, and generally improve the shore. The duty of the foreshore engineer was to endeavour

to do first-class and effective work for his clients at the lowest cost, and not to show off his own skill at wall construction at those clients' expense. The speaker therefore placed groynes first on the list of protective devices, because they helped to utilise the current and wave forces of the sea, and at the same time might lead to an enormous saving in the expense. Of all the methods that employed by the late Mr. Case appeared to be the most scientific and successful. He described the benefits the groynes had conferred on Dymchurch and Deal, and said that Worthing and Eastbourne might be cited as examples, where the Case system had not yet been tried, though a few groynes on the Case principle had been put down on the shores, and it was to be regretted that Mr. Case ever gave his sanction to experiments on such a limited scale.

Criticising the high groynes which engineers had for years past adopted round these shores, they would find that in 99 cases out of 100 scours were caused at the very points it was necessary to protect. The Hastings and St. Leonards foreshore furnished an excellent example. There were deep scours on the lee sides of all the groynes, and the shore had the appearance of a large saw when viewed from the sea. Each groyne was a distinct source of weakness to the wall as a whole. The scours to the lee were turned into small deep fjords at high tide, and into those the sea rushed with terrific force whenever there was a storm dead on shore or from the south-east. On the Hastings shore they would observe that there was a marked scour all along the sea ends of the high groynes, the soft yellow sandstone being exposed and constantly subjected to erosion through the sawing action of flint shingle, which was carried laterally along the shore with every tide. In the course of time this encroachment must reach the line of the esplanade wall many feet below its present foundations, and the expense of underpinning, toe walls, sheet piling, &c., would be very heavy. He summed up the objections to high groynes as follows:—(1) Scour close up to wall; (2) scour at or about mean sea-level and general denudation of the shore between mean sea-level and low-water mark; (3) danger to children; (4) impossibility of getting along the beach without the exercise of more than ordinary agility in climbing up or down vertical structures of 8 or 10 feet in height. The Brighton authorities had expended, and were expending, large sums of money on the unsightly high groynes, and it was not going too far to say that the Brighton shore would be more attractive and more safe had these high groynes never been constructed. The speaker proceeded to advocate a slanting groyne, constructed

in such a manner as to be easily removable and adaptable to the varying conditions of the beach. In conclusion, he referred to the efforts that had been made to induce the Government to establish a department to undertake various duties in connection with the protection of the coast of the country against erosion by the action of the sea, and said that the serious disturbances in South Africa rendered it impossible to worry the Government department with a matter of secondary importance.

PROTECTION OF FACTORIES.

AN arbitration was held at the Royal Courts of Justice on July 29 between the London County Council and the Morgan Crucible Company, Limited, of Battersea, which involved a question of considerable interest to owners of factories and to the building trade in general, as to what is or is not a reasonable requirement on the part of the London County Council, as sanitary authority under the Factory and Workshop Act, 1891, in regard to the provision of a means of escape in the case of fire for persons employed in a factory. The Morgan Crucible Company's premises are in Church Street, Battersea, and consist of several blocks of buildings. Early in 1900 the premises were being reconstructed, and after inspection by an architect on behalf of the County Council certain requirements were made by that body that alterations should be carried out with a view to providing adequate means of escape for persons employed on the premises. The Morgan Crucible Company carried out the alterations in accordance with the requisitions made on them, so far as they thought them reasonable or necessary. Blocks A and B of the premises in question were practically one block and communicated with each other. Block A was provided only with an internal open wooden staircase, but at the corner of Blocks B and D an external iron staircase was erected. The owners considered that the internal staircase in Block A, together with the iron staircase in Block B, to which there was access from Block A, was amply sufficient as a means of escape from Block A in case of fire. The London County Council contended that this was not sufficient, and they required the owners to provide an external iron staircase at the south-east corner of Block A in addition to the staircases already provided. The owners declined to accede to this requisition, and the matter was therefore referred to arbitration.

The arbitrators were Mr. Thomas Blashill, representing the London County Council, and Mr. Maurice Adams, for the

Morgan Crucible Company; with Mr. F. R. Y. Radcliffe, barrister-at-law, as umpire.

Mr. Horace Avory, K.C., appeared as counsel for the London County Council, and Mr. Wood Hill was for the Morgan Crucible Company.

On the part of the London County Council evidence was given by Mr. W. E. Riley, architect, who surveyed the factory for the Home Office, and Mr. Roland Plumbe, architect, who inspected the premises at the request of the London County Council. They expressed their opinion that the present means of escape from Block A were insufficient and an additional staircase was necessary. They believed that in the case of fire the internal staircase in Block A would become filled with smoke, and the inmates of the block would be prevented from reaching Block B. Mr. Chatfield Clarke, surveyor to the Board of Trade, expressed a similar opinion.

For the Morgan Crucible Company Mr. Basil E. Peto, a director of the Company, said that when they received in January last year a notice from the London County Council alterations were being made in the premises, and the Council's requisitions were complied with, except so far as the erection of a staircase at the south-east corner of Block A was concerned. The owners considered that the present outside staircase in Block B was amply sufficient. There was practically no danger of fire, and no inflammable material was used for the premises. The ground floor at the time of Mr. Riley's inspection was used for packing, but now was only used on the storage of crucibles. The premises were fitted with all necessary appliances in the case of fire, and the men could clear out from the top floor in a little over a minute. He did not think that there was the slightest danger of the men in Block A being caught by fire. The estimated cost of the staircase proposed to be erected was 600*l.*, and it would involve a loss of 9,600 cubic feet of space, which represented a loss of 34*o*l.

The company's fireman, who had charge of Blocks A and B, said that thirty-six persons were employed on the top floor and twenty-two on the next floor. He found that it was quite easy to get away from the top floor of Block A by the iron staircase through Block B. There was no danger of a panic amongst the workmen.

The superintendent of the fire brigade at Leicester, who was also an inspector of factories, said that there were between 400 and 500 factories at Leicester. He had inspected, at the request of the Morgan Crucible Company, their premises in Church Street, Battersea, and he considered the means of

escape from the building ample. It was also easily accessible to a fire-escape.

The arbitrators reserved their award.

ST. PAUL'S CATHEDRAL.

A REPRESENTATIVE of the *Globe* has had an interview with Mr. E. J. Harding, the clerk of works at St. Paul's, from whom much of the following information was obtained:—

It may be said at once that there are numerous cracks in the Cathedral; in fact, the building "settled down" even in Sir Christopher Wren's time, and the famous architect had to carry out certain works for the purpose of remedying the evil. These precautions were continued for about one hundred years; iron ties were fixed in the walls where the cracks appeared, and the latter were carefully "stopped." The cracks, however, reopened at intervals, showing movement on the part of the building. It may be explained that the Cathedral, contrary to the generally accepted view, is not built on a bed of concrete, but on what is known as potter's earth—yellow clay—which needs moisture to keep it solid. If the clay is drained it becomes like powder, rendering the surrounding buildings very unsafe. Asked as to what had caused the recent fissures, Mr. Harding was very cautious in his reply, declining to give any definite opinion; but he stated that it had been known for many years that the walls of the building were cracking. When the District Railway was made, followed by the construction of the electric line from Waterloo to the City, and the numerous tunnelling operations carried out by various authorities, the cracks, which had been carefully filled up, again reopened, while others appeared. These were on the south side of the Cathedral, the nearest point to where the tunnelling work had been done. And it is a significant fact that the slight fissures in other portions of the sacred edifice remained practically stationary.

The Cathedral authorities are doing everything in their power to lessen the evil caused by the withdrawal of moisture from the clay. One of the windows in the south transept and the wall which is vis-à-vis to it are in the worst condition. The bars of windows just below the Whispering Gallery are slightly buckled, and underneath are several cracks; while on the corresponding side there are similar fissures, and in addition the cornice beneath has "settled down" at one end. A number of strong ties have been fixed in the walls on either side, and as

the results of the movements of the building are imperceptible to the naked eye, ties of cement, which stand out about a quarter of an inch, have been placed across the cracks, so that the slightest movement will cause the cement to break, thus indicating at once the seat of the mischief. These ties of cement are examined at stated intervals, and if anything wrong appears steps are immediately taken to put matters right. It may be pointed out that experience has proved that the public works carried out during the last twenty or thirty years have had the effect of drawing away some of the moisture from the clay.

The foundation of St. Paul's is several feet below the floor of the crypt, or about 15 or 20 feet lower than the street level. The proposed new electric line from the City to Kensington, which, if sanctioned, would pass under Carter Lane, close by, has caused some anxiety to the Dean and Chapter, for, although in theory the driving of the shield (by means of which the clay is got out to make room for the "tube") is absolutely without danger to surrounding buildings, in practice it is not always the case, because it cannot be foretold what kind of strata is likely to be tapped; and even when the operations have apparently been successfully carried out fissures may appear years later in these buildings. The walls on the south side of St. Paul's, as has already been pointed out, contain many cracks; but owing to their slow development it is very difficult to localise them. In no part of the Cathedral is there a great fissure, only a number of small ones, all tending in the same direction, thus increasing the danger by aggravating the older ones. As showing that the authorities are fully alive to the importance of keeping the Cathedral in thorough repair, it may be stated that there are about forty men, representing practically the whole of the building trades, permanently employed in carrying out what may be described as repairing work. These are, of course, in addition to those who are engaged from time to time in executing the larger alterations.

It has not yet been definitely decided what action the Cathedral authorities will take in view of the proposed new electric railway; in fact, great reticence is being observed in the matter, but it is understood that Mr. Somers Clarke, the consulting architect, has been in communication with a well-known builder, and it may, we think, be taken as practically certain that the scheme will be opposed on the ground that it will tend to weaken the structure which the genius of Wren erected, and which is regarded as the central object, the very palladium, of modern London.

The Architect.

THE WEEK.

THE opposition to the appointment of the late Mr. BRYDON's principal assistant by the Office of Works, in order to insure the faithful realisation of the designs for the public offices in Westminster, is unreasonable. It is well known that when an architect attains the position of Mr. BRYDON the greater part of his time cannot be occupied at the drawing-board. He has to trust to the skill of others, and the chief assistant has necessarily to be imbued with the spirit of the principal. The assistant sometimes is a more able architect, but out of loyalty he accommodates his own style to whatever is supposed to be the characteristic of the office. He has, moreover, to be self-suppressing, and cannot by speech or writing suggest the extent of his principal's indebtedness to him. To say, as Professor AITCHISON has done, that "BRYDON's draughtsman is unknown to most of us, and though he may be the most brilliant of architects we do not know it," is to pay a tribute to the fidelity of that gentleman. To suppose that any architect in large practice would entrust the direction of a drawing-office to an assistant who was no more than a substitute for a machine, would be as absurd as saying that the great legal firms employ men taken from law stationers' desks as managers of departments instead of fully trained solicitors. Professor AITCHISON's own practice hardly qualifies him to pose as an authority on the conducting of a large office with many draughtsmen, and the "most of us," to whom he refers, we believe to be gentlemen in a similar position. Through the modern system of architectural procedure it is indispensable that assistants who are competent in all branches of office work, and yet reticent about their abilities, should be available. Sometimes their engagement is intended by them to be no more than temporary, and it must be allowed that in the majority of cases the prospects of a "clerk," if he possessed the ability of a STREET or a NORMAN SHAW, are rarely encouraging. The late J. M. BRYDON also occupied that position in several offices, as did the late WILLIAM YOUNG, but both were shrewd enough to realise how duteous services were likely to be rewarded. If assistants are to be deprived of the very few opportunities which arise for making their work known to "most of us," or to the small clique who, without any authority or right, assumes to judge the ability of architects, it must be expected that only inferior men will seek for employment in architects' offices.

ARCHITECTS who visit Paris during the present season will find interesting studies in the premiated buildings selected for the "Concours de Façades," and which have received official approval. In 1899 a competition was organised among Parisian architects, in which those houses built during the year that were judged to be most beautiful were to be distinguished by rewards to those who could be considered as their creators. The names of the architects and the houses which have gained success for them are M. BOUVENS VAN DER BOYEN, jun., for No. 8 Rue de Lota; M. BRUNEAU, for No. 270 Boulevard de Raspail; M. MARCEL, for No. 17 Avenue de Breteuil; M. MORIN-GOUSTIAUX, for No. 1 Rue Le Peletier; M. RIVES, for No. 45 Rue du Château-d'Eau; and M. SINELL, for No. 11 Rue Edmond-Valentin. A report by M. NÉNOT, the architect of the New Sorbonne, gives the reasons for the selection. Of the first house it is said the façade is of a charming and artistic simplicity. Its character, slightly inspired by Florentine architecture, has been modernised and becomes French by the judicious employment of ceramics and coloured bricks. The façade in the Boulevard Raspail is of brick and stone; the ornaments are described as sober and well studied. The building is in harmony with the district, and the seven storeys have been superposed with good taste and without monotony. The façade in the Avenue de Breteuil is said to show a charming design, the whole being well united; the bow window is in harmony with the other features, and an elegant solution of an architectural difficulty is seen in the treatment of the bays under the grand balcony. In the house

in the Rue Le Peletier, according to M. NÉNOT, the climax and the maximum of architectural decoration have been reached. The eye is charmed by all the statues, ornaments, gilded grilles, and there is boldness shown in the design of the upper part of the entresol sustaining the balcony on the first storey. The house in the Rue Château d'Eau is recommended especially for the bow window and the able superposition of the three principal storeys. Finally, the example in the Rue Edmond-Valentin is mentioned as exemplifying the progress which has been made in the past thirty years in modern construction.

IT was long supposed that the greatness of Genoa had passed away, for although there might seem to be activity in the port the trade was thought to be only local, for TASSO'S "la reale, la nobil città," appeared ill adapted to compete with younger and more go-ahead seaports. The construction of the Saint-Gothard railway caused a change. Genoa became the principal port for Switzerland and Germany, and attracted much of the traffic which used to find its way to Marseilles. When the Simplon railway is completed it is anticipated that Genoa will make a still further advance. The inhabitants, who always seem to carry about with them the state and glory of their superb ancestors, have realised that a different manner must be assumed if they are to have a share in modern commerce. The chief contest is with Marseilles. Both cities realise that improvements are indispensable, and it may be expected that during several years there must be a large outlay in both on hydraulic works.

AN addition has been made to the series of tractates on the designing of ironwork by Mr. HENRY ADAMS. It relates to built-up steel stanchions, and about fifty varieties of sections are discussed. From the author's experience as a professor, he is able to communicate his knowledge to the student in a very clear manner, and with ordinary diligence what is said can be understood by novices in designing. Unlike many similar treatises, the pages do not bristle with formulæ requiring advanced mathematics. The little book will consequently be found most useful to those who are engaged in a variety of engineering which is in constant demand.

OLD railway carriages have long been used for occupation as if they were cottages and also as small stores. Although they are not more dangerous than caravans, still few people would care to have them near their houses. Whether they can be treated as buildings is a question which has several times been tried in the law courts with varying results. Tram cars are, however, more easily obtainable, and generally are in a better condition. Occupants must have a very humble opinion of the requirements of a home who would venture to live in the cast-off carriages of several English railways. If sanitary laws were administered as they ought to be a great number of those carriages still in use would be at once consumed by fire, for they are storehouses of infection. The tramway cars have to be kept in cleaner condition, and they are therefore more eligible as residences. It must be owned, however, they do not comply with the ordinary by-laws relating to buildings. But it is difficult to discover points which will insure conviction. The Sheffield Corporation have just had to encounter those difficulties. They summoned a possessor of transformed cars for neglecting to give notice to the city surveyor of his intention to erect a new building, and also for failing to make the roof and walls of incombustible materials. The magistrate dismissed the summonses relating to the notice. One of the cars was to be used as a meat-shop and the other as a warehouse for oil-cloth and linoleum. Neither was considered as a "domestic" building. There was, in the absence of fireproof materials, the magistrate said, an infringement of the law. Owing to the obscurity in the term "new building," the offence was so trifling only a nominal punishment was inflicted, and so the order made was to pay 2s. and costs on each of the two summonses upon which conviction was made. The defendant was allowed costs on the two summonses dismissed. After the decision we may expect to see a rise in the value of cars which are no longer adapted to run on rails.

THE NEW YORK STOCK EXCHANGE.

AMERICAN architects are not afraid to have particulars of their latest works divulged. They know that one of the best means of securing new clients is by explaining how they had met the demands of those who had given them commissions. There is no desire to conceal new arrangements from other architects. The rivalry of competitors is not to be overcome by darkness. Like DIBBIN'S "Poor Jack," it is believed that "the world's wide, and there's room for us all," since in a country that is every day extending with the rapidity of the United States it would be impossible for any individual or firm of architects to be able to carry out more than a very small fraction of the commissions which are constantly arising. It is stated, for example, "that the yearly cost of building in New York amounts to more than the yearly cost of the food for its inhabitants." There is more likelihood the amount will be increased than diminished. An American building must be an exemplification of scientific improvements, and in order to introduce in it some new method of ventilation, electric light or heating an existing building is sacrificed without scruple. American inventiveness is, therefore, one of the best auxiliaries to new commissions which architects can utilise. This is to a large extent exemplified by the history of the New York Stock Exchange which is now approaching completion, and of which the *Architectural Record* of New York publishes an elaborate description.

The building which has had to be supplanted did not date beyond 1870, and could not be considered as ancient, but the American financial system is being expanded from year to year, and it was found that the convenience of members could not be secured in premises which were thirty years old, in spite of the numerous alterations which were accomplished at a large expense. It was therefore resolved to meet the difficulty by the erection of a new building. The committee had two projects prepared by Professor WARE and Mr. C. W. CLINTON to guide the selected competitors who were to be invited to contribute designs. The difference between the two was whether the ground floor should be arranged as a large bank, which could be let to a company and bring in a revenue. Each competitor had therefore to prepare two designs. Those by Mr. GEORGE B. POST, who is responsible for many of the lofty buildings in New York, were approved. The committee decided to abandon the banking storey at the desire of a majority of members. But they wished that the elevation, of which it formed a prominent part, should be preserved and adapted to the new conditions.

The principal elevation to Broad Street therefore shows a structure of the Corinthian order, with a sculptured pediment, which to some extent recalls the Pantheon of Rome, but instead of standing on the ground it is supported by a podium pierced by two rows of doors and windows, which correspond in number with the openings between the columns. There is in consequence no grand entrance. The columns, which are 52 feet 10 inches in height, with a diameter of 6 feet 10 inches, stand in front of an immense window which stretches between the piers or pilasters at the sides, and has therefore an area of about 50 feet by 100 feet. This window, with another of equal size, gives light to the great Board-room, which has a floor area of about 15,000 square feet and is the essential part of the structure. In other words, the members of the Exchange, instead of entering the hall from the street-level have to ascend about 12 feet at one side. So much American business is transacted in upper storeys the ascent does not count for much, and on one side of the building the height is greatly diminished. By the building committee's project the Board-room would have been placed on the second storey about 20 feet above the level of Wall Street, and over 30 feet above that of Broad Street. But the brokers gave more attention to the contingencies which might arise on occasions of failure or of panic, when members would be eager to reach their offices without loss of time, and as staircases were impracticable on account of height and insufficient space, the rush for the lifts or elevators was likely to bring about dangerous consequences.

The site was difficult to deal with, especially as water was to be met with at different levels, and could not therefore be easily controlled by one system

of conduits. The architect decided to have a caisson foundation, and the question then arose whether the foundation should be carried down to the rock, a distance of 60 feet, or only a part of that depth. The foresight of Mr. POST determined the difficulty, for we are told he "discovered by computation that, owing to the fact that there were no interior supports in the immense Board-room, the upward pressure of the water in the subsoil would be three times greater than the superimposed weight, which would have resulted in the upheaval of the Board-room floor, together with the storeys underneath." Another impediment to planning was an existing safe deposit vault which, having resisted the ingenious methods of American thieves, found favour with the committees. It was therefore necessary to arrange the new deposit vault in such a position that the older one could remain in use until nearly the completion of the building. Beneath the Board-room there are consequently three basements and a cellar. The subterranean part serves a variety of purposes. There will be found hat and cloak-rooms, the inevitable barber's shop, baths, private rooms, toilet-rooms, locker-rooms. Special accommodation is found for the employes, who henceforth need not mingle with the members unless when on business purposes.

It is not uncommon in the Exchange for over three millions of shares to be made the subjects of financial transactions during one day. To aid in the work 500 telephones are put up in the Exchange, and they are generally in constant use. The arrangement of the telephones was one of the difficulties of the planning. They have been placed in one group in the New Street end of the building. The loss of a second might mean a serious blow to a member, and everything has therefore been done to facilitate the use of the telephones. We are told "that despite the large amount of space which the great piers take up on the floor, they are turned to such good purpose by the system of encircling telephones that an actual saving in space is effected; for more telephones have been designed in these positions than would have been possible had the piers been replaced by a simple running wall only thick enough to support the end of the building."

The old Exchange was not well lighted, and it may be on that account it was decided to obtain the utmost amount of daylight. There are two storeys above the Board-room, which measures 112 feet by 130 feet by 80 feet. Mr. POST therefore decided on his colossal screens, by which there would be one window occupying the front of the Board-room on two streets. It is not enough in such a case to propose and design. It is no less necessary to provide for the needs which will be involved by the existence of the vast masses of glass. In the first place there is wind-pressure, which at 35 lbs. per square foot would average a force of 75 tons on each window. In addition each window weighs about 13 tons. Mr. POST has arranged to use 18-inch iron mullions, which will be placed in pairs directly at the back of the Corinthian columns and hung from girders overhead as window frames. The temperature in New York is sometimes freezing, and, as the two end walls of the Board-room can be considered as entirely glass, an immense amount of cold air will be introduced to the Board-room. To compensate for this the following arrangement has been adopted:—"Steam radiators will be installed at the bases of the windows for the express purpose of heating their interior surfaces. The glass for a certain distance up will be made double, the space between serving as a cold air slit through which the air will circulate down and over the steam coils placed at the gallery floor. The heated air then arising will be dispersed over the interior surface of the window." Provision has likewise been made for cleaning the windows, and blinds have been invented which can be drawn backwards or forwards by touching electric buttons. A large skylight will also be constructed; the room will likewise be illuminated by means of electric and incandescent lights. If Sir JOSEPH PAXTON were still on earth he would be the first to congratulate Mr. POST on his success in drawing inspiration from the Exhibition building of 1851, and improving on the original model. Assuming the Stock Exchange screens can withstand the elements and the

settlements of the building, which are inevitable, we may expect to hear from America of the revival of projects for hospitals, convalescent homes and similar buildings, in which glass would be used instead of other materials.

One feature in the Board-room is the "bulletin-board." This is an arrangement of 1,200 squares in a space of about 300 square feet. Each square has a number which belongs to a member of the Exchange, who pays for the privilege. If any member is required the appearance of his number attracts his attention amidst the utmost din of the Exchange. In the bulletin which will be used in Mr. Post's Board-room, the numbers will be inscribed in opaque glass, which will be illuminated by various coloured electric lamps, according as the member is required to return to his office or meet a visitor in a particular part of the building.

The Corinthian façade does not occupy the whole frontage of the site in Broad Street. On one side of it is a strip of building containing no less than seven storeys. The windows are of the plainest, as if it were intended to suggest how little importance was to be attached to any other part of the building except the great Board-room. It was an architectural problem that might have been turned to account in an artistic sense, although not to financial profit. So much austerity appears to express the belief that unless a Classic façade is imitated there is no power in America that can produce a Stock Exchange that will answer its purpose, and be adapted to the necessities of the site. If there must be masquerading in Classic forms, the poor relationship of the seven-storeyed structure should at least have some superfluous Classic odds and ends cast to it in order to conceal its poverty. Perhaps, however, it was intended to make the front symbolic of DIVES and LAZARUS; but, whatever the meaning, it would be an advantage if so elongated a fabric, which is even unfitted to serve as a foil to the Board-room, and can only be detrimental to its effect, should be removed.

The building is likely to cost 3,000,000 dols. The committee declined to adopt the system of tenders, and the work was entrusted to Mr. C. T. WELLS, who has been largely employed in New York.

ON A POEM BY SCHILLER.

ACCORDING to CARLYLE, the poets GOETHE and SCHILLER lost much precious time through *Kunst*, or art, which could be more usefully employed. The assertion was partly inspired by his own aversion to art. He records with so much delight the expression he heard uttered by a politician, "May the devil fly away with the fine arts," we are surprised he did not write a biography in several volumes of that approved individual. There was, however, another reason. CARLYLE was undoubtedly a great writer, with a marvellous command over words; but his was not a creative genius. His best writings deal with the demolition of theories or institutions that were obnoxious to him. He was incompetent to give outlines of the substitutes for them which would bring happiness to the world. Now artistic power is simply creative power. CARLYLE was deprived of it, and therefore it became to him as sour grapes, and all those who devoted themselves to its consideration became in his eyes mere dilettanti folk, windbags with a peculiar vocabulary which was of no use for the salvation of man.

GOETHE is like a world, and it would be ridiculous to attempt any description of his theories about art in a very limited space. But SCHILLER's genius is of a simpler class, and art was so potent with it we can at least obtain a glimpse of some of the results which followed. In one word, art with SCHILLER became almost synonymous with law. This will appear rather remarkable to those who have not given more than a passing attention to his career, for he began as a law-breaker. The first work that made SCHILLER's name known to his countrymen was the chaotic drama of "The Robbers," which out-horrored any known example of the Early Elizabethan drama. Now "The Robbers" was a protest against life as it existed, and was inspired by the too rigid system of instruction through which SCHILLER had passed. The Grand Duke of WÜRTEMBERG, under whom the poet's father acted as inspector of forestry, was desirous of establishing a school or institute for favoured

youths in which law in the form of military discipline was to be supreme. SCHILLER, who believed he was destined for a pastor's life, was unable to follow the training which was to prepare him for the army. He was therefore drafted to jurisprudence, but he could not relish a science that was expounded by professors who seemed to derive their pedagogy from drill-sergeants. Then he was turned over to another class of professors who taught medicine as if it were exercises in a barrack-yard. Finally, as he found he could not comply with the conditions of the ducal seminary, SCHILLER ran away from Württemberg to Mannheim, having the manuscript of "The Robbers" as his only worldly wealth. He consequently was held to be a deserter, a rebel, an ingrate, and not until his name had become famous was he allowed to revisit the house of his parents.

From such a start in life it might be concluded that SCHILLER was destined to lead a revolt against everything sacred or secular which was upheld by authority, and that all established institutions would appear to him as only variations of the Württemberg Academy. But his genius was too just, his observation too keen to allow him to fall into an error of that kind. The professors had endeavoured to enslave his mind; at least he thought so, and against such a system he rebelled. But there was never a poet who was more amenable to discipline when properly applied. That he could discriminate between license and liberty, the greater part of his works in prose and poetry are sufficient evidence. All the hours which he devoted to *Kunst* and which CARLYLE thought were spent in pastime, were in reality an exhausting investigation of the rule and restraint which every artist must observe if he would attain to perfection. In saying this it should be remembered that to SCHILLER art was a vast power, whose operations were to be observed in every variety of creation which could be regarded as worthy of man.

The earliest exhibition which SCHILLER gave of his principles may be taken as being found in the poem of "Die Kunstler," or "The Artists." It was written at the end of the eighteenth century, when, as is common in modern times, imaginative men believed that a new era was about to commence which was destined to surpass all its predecessors in obtaining happiness for the human race. The poem also marks the close of SCHILLER's second period, although from its character it seems better adapted to stand at the head of those of his third and greatest period. It cost him more time than any of the poems he had previously written, and he admitted that he was satisfied with it, which was unusual for SCHILLER.

He begins by representing Man as standing haughtily on the incline of the eighteenth century, feeling the pride which was natural with the ripest son of time. Reason had made him free, law had given him strength. He could believe he was lord of nature, that appeared to love the fetters he imposed, and served his purpose in thousands of ways. Man might become intoxicated with the thought of his victories over nature, but the poet asks him to remember in his exultation the hand that was first stretched out to him on the barren strand of life where he was left a forsaken orphan. It was Art who rescued him, and by slow degrees taught him moderation in all things, and inspired him with ideas of goodness, duty and virtue. Science at the close of the eighteenth century appeared to be the coming providence of man, but the poet tells him to bear in mind that in industry the bee is superior to him, in craft a worm can be his teacher, in all his knowledge he never can approach the seraph. Art, however, he could claim as his special prerogative, "Die Kunst, o Mensch, hast du allein." When Mr. RUSKIN, in the article by means of which he expected to win a bride, told his readers that in the railways of which they were so proud they were merely trying to emulate the swiftness of the gnat and of the swallow he was expressing a truth in SCHILLER's spirit. The pith of much of RUSKIN's teaching is also conveyed by the two lines in which SCHILLER informs his representative man that it is only through the beautiful as a gate he can enter into the region of knowledge:—

Nur durch das Morgenthor des Schönen
Drangst du in der Erkenntniss Land.

The poet was a faithful believer in the law of progress.

although it had not been explained with the precision which belongs to the special studies of the nineteenth century. In the remote period when man struggled to rise from the savage state no one can say what it was that compelled him to become differentiated from the mammoths and other beings who shared the world with him. It was, therefore, allowable to SCHILLER to suppose that ideas of order and of law were introduced when rude attempts were made to produce art. It matters little whether the initial experiment was the scratching of the portrait of a reindeer on a bone, as the geologists would have us believe, or the burning of lines on a gourd, which, according to Mr. WHISTLER, was the earliest symphony in black and yellow, or the arranging of threads with bone needles in zigzags, which was SEMPER'S theory; once the first step was made in creation it became possible to go further and to continue the operations until human thoughts and nature's works were exhausted for representation. The important postulate is, Can we grant that progress of civilisation or intellectual development began with very crude experiments in art? and if so the rest becomes easy. SCHILLER'S contemporaries who followed science would give a negative answer.

It is difficult, if not impossible, for an ardent man to go on repeating his first success; he is always aspiring for something better. In course of time, and just as men surpassed one another in lifting weights, shooting with arrows, in wrestling or swimming, we can suppose that less imperfect representations of objects were produced and admired. If a woman of a tribe produced angular lines on a piece of stuff she would have to hide her diminished head if another woman made use of double lines, or reversed the position of the angle. Every endeavour in competition would diminish the vast distance between the contours of a living being and the sketchy strokes on a bone, a gourd, a piece of stuff, or a stone. Once let a few imperfect lines be accepted as representative of the form of something else, in course of time lines or marks would be employed which would also serve to express qualities. In that way symbols would be introduced. SCHILLER, let us remember, was to some extent combating science, and he therefore urges that thousands of years before SOLON and other law-makers had written their edicts, the virtues which were desirable for man to practise were made plain to a childish understanding by the aid of artists. With much subtlety he suggests that VENUS who was taken simply as a beautiful woman, that was not always believed to enclose a moral spirit was originally intended to be URANIA, who was so resplendently virtuous that only the purer celestial spirits could gaze upon her as she sat upon her sun throne. She it was, however, who came down to man and endeavoured to give him some consolation by painting on the walls of his earthly prison (Kerkerwand) a vision of Elysium. At a later time her beneficence was entrusted to artists. Men of letters, says CARLYLE, are a perpetual priesthood; but before him SCHILLER had expressed a similar idea, although artists took the place of writers. They were, he affirmed, the purest out of millions who were consecrated to that service, for they alone were able to see the bodiless URANIA ("Vor deren Aug' allein sie hüllenlos erscheint"), and to tend the fire on her altars here below. To MILTON also she was a goddess. SCHILLER was a devotee of the ideal, and he believed it was possible to have notions of beauty which no pencil could express or any words describe.

It is reasonable to suppose with SCHILLER that to savage man the earth appeared a terrible wilderness, which was as fearful as fields in the dark may still be to young children. To the uncultured mind it was immeasurable and black as night ("ein unermessner Bau im schwarzen Flor der Nacht"). But as soon as it became the subject of representations much of the terror must have vanished. It grew more familiar, and the rudest attempt became like a reflection on the water, a sort of duality which made the artist a wonder-worker and a possessor of mysterious power. We cannot in referring to those primitive times count by centuries any more than by days, and the poet is not to be blamed if he only mentions the visions which passed before him, without any regard to the intervals of time that came between them. We must therefore accept what SCHILLER says, that imitation in time brought men to creation, and that the obelisk, the pyramid, the hermes, the column were all derived from imitations of natural objects; that

through the reed torn from the river came a faint echo of forest melodies, and that victorious deeds were made to live in primitive song.

SCHILLER lived at a time when the study of man was not pursued in a scientific manner. He does not attempt to make any research about the first experiments in art. He could not have known of the carvings of animal life then lying in the Kesserloch Cave in Switzerland, and there were no prehistoric collections to excite thought about the origin of the curved lines which are to be seen in weapons, ornaments and utensils. He had, no doubt, read about the contest between the Greek painter and GLYCERA, the flower-girl, in which the latter made more beautiful garlands than the artist could paint. He therefore boldly says that art began with the arranging of flowers, that the nosegay or bouquet subsequently became a crown, and later man did his best to imitate the flowers. In the same way, as flower was added to flower, there was a combination of distinct existences for the sake of unity; pillar was added to pillar, and ballads relating to individual heroes became the elements of an "Iliad":—

Die Säule muss, dem Gleichmass unterthan,
An ihre Schwestern nachbarlich sich schliessen,
Der Held im Heldenheer zerfliessen,
Des Mäoniden Harfe stimmt voran.

SCHILLER would expect that an example of modern art should express individuality; but he could not help realising how much in ancient art was repetition, and as a lover of Greek architecture he must have felt that the temples in which the columns belonged to one order were preferable as exponents of law, which is the basis of all art, to buildings such as some Early Christian churches which were made up from the spoils of temples and in which the majority of capitals were of a different form. It was the regularity which was exemplified in his own works, and especially in architecture, which made man come to the conclusion there was law all round him and above him. Thus it happened that laws of nature, harmony of the spheres and similar expressions were known long before experimental philosophy discovered there was a mathematical expression for many of the laws of nature:—

In selbstgefall'ger jugendlicher Freude
Leiht er den Sphären seine Harmonie;
Und preiset er das Weltgebäude,
So prangt es durch die Symmetrie.

Again and again SCHILLER returns to the same theme, that whatever was best in science, as known in his day, was earlier suggested by the artist. It may not be evident how far a building, a statue or a picture, can express facts in physical science, but if their works are supplemented by those of the artist-poet the difficulty is diminished. When SHAKESPEARE makes a character promise that he will be "true as earth to the centre," he must have had in his mind's eye that law of gravitation which NEWTON was afterwards able to demonstrate by the fall of an apple.

SCHILLER wrote much which was due to inspiration in the truest sense of the word, but there never was a poet who laboured with more assiduity to obtain the facts to which genius could impart life. He was the first of the labour-poets, for to him the ordinary workman, or rather craftsman, could be as interesting as any painter or sculptor. Large prints made up of a series of illustrations from his noble poem, "The Lay of the Bell," can consequently be seen in many workmen's rooms in Germany. They are as encouraging as any treatise on political economy. In the poem he exhorts the workman to have pride in himself by showing how important a part an ordinary church bell in a village can play in relation to the lives of the inhabitants. But, as the founder declares, it is not merely the labour of the hands that suffices to gain recognition, for every true man must despise all those who execute work without giving it a thought, and everyone should in his inner heart be able to trace out whatever he has to create with his hands. Indeed, all that CARLYLE says about the dignity of labour is only cold and pessimistic if compared with the glowing lines of the German poet, who still remains the idol of his countrymen, especially in their youth and in their old age.

Many poets draw varied illustrations from natural objects in the fields and woods and from lakes and rivers

because they believe with COWPER that GOD made the country while man made the town. SCHILLER loved the beautiful landscapes which are to be seen in so many parts of Germany, and which even humble people can enjoy from little summer-houses. But his delight was no less found in places where men congregated. In the "Spaziergang" we have country and town united. But the town was dear to him because there the arts flourished. An artistic heaven is described by him as resting on slim Ionic columns, and the whole of Olympus was revealed within its dome. Lightly as IRIS springing through the air or as an arrow from the cord the bridge crossed the impetuous stream. The painter imparted a new life to his subjects, and the sculptor's mallet infused a soul in stone. In all this SCHILLER could see no difference from nature, for as became a student of SHAKESPEARE he believed that nature can only be bettered by some means which should be described as nature's creation.

LYCH-GATE, BOGNOR.

THIS lych-gate has recently been erected at the Royal Naval Academy, Bognor, Sussex, for Mr. H. WILLIAMS-WHITE, B.A., the Principal of the well-known Academy for special tuitions for cadetship in the Royal Navy. The gateway, which has been erected as a memorial

to the late QUEEN, is built entirely in English oak, which has been specially selected for the purpose, and the roof is covered with plain brown tiles. The work has been well carried out by Mr. T. START, builder, of Bognor, from the designs and under the superintendence of Mr. W. PUTTICK, architect and surveyor, of 56 East Street, Brighton. Other important alterations and additions have also recently been carried out at the Academy from Mr. PUTTICK's designs.

FURTHER DISCOVERIES IN CRETE.

LIKE other Cretan traditions, says Mr. D. G. Hogarth in an article in the *Times*, the claim of the island to have had a hundred cities is proving not altogether vain. Remains of primitive settlements, too considerable to have been villages, are coming to light at far more points of the Cretan coast than

bear a name in classical atlases. There are half a dozen such in a part only of the eastern half isle, and the recent exploration of two among these supplies a key to the rest. One now suspects a "Mycenæan" site in every larger plain of the periphery. So far as searched at present, these towns show little or no sign of having continued into the historic period. Their civilisation was blotted out with the "Mycenæan" domination. The succeeding class of remains is found for the most part higher up inland, on difficult heights or in remote gorges. The coastal plains were secure no longer. An age of seafaring and communication between ancient seats of luxurious life had given way to one of local and jejune development. But why and how we may only guess.

The crown of the great Cretan civilisation was in Mindan Knossos. No other site in the island has furnished, or is likely to furnish, evidences of so high artistic achievement. But there is at least one notable site better preserved. Knossos, owing to its revival in later epochs and the proximity of its site to the Mediæval capital of Crete, has suffered wreck and plunder beyond other sites. Much knowledge and more imagination are required to invest with full significance its "shorn and parcelled ruin," which, lying low in a featureless valley, conveys no immediate impression of magnificence. One must study its cracked and faded fragments of fresco, and look narrowly into the work of its reliefs and stone vases, to realise why it claims to rival Mycenæ in interest. The house must be reconstituted from its furniture rather than the furniture from the house.

The ordinary visitor, not a specialist, will, therefore, prefer the ruin at Phæstos, on the south of the island, the full revelation of which has certainly been the sensation of the past spring. When Professor Halbherr announced in 1900 that he had begun upon a lesser Knossos no one expected that he and his Italian colleagues were to find in the event a palace more uniform, complete and imposing. What they have now laid bare stands alone in Crete as a spectacle. Even those fresh from the Mycenæ walls and the Treasury of Atreus, or even from Egypt and Syria, must admire the broad staircases and majestic courts of Phæstos, all on so intelligible a plan and preserved to a point which excites without overtaking imagination. The ruin covers a promontory of rock. Far below the greatest of Cretan plains stretches to Mount Dicte in the blue distance. Ida hangs right over the site, and through a gap in the screen to west show the snows of Sphakia, all three high-masses of the Cretan relief being visible from this one point. In so superb a setting it is the more pity Phæstos should be so difficult of attainment. It may, indeed, be reached in an hour from the sea, but it is from the stormy, harbourless Libyan Sea. A steamer that had landed its passengers in the sunrise-calm at Dybaki would often be unable to re-embark them at noon. One must ride, therefore, from Candia, making a three-days' expedition, which will include also Gortyna; but the days are long and the paths are rough.

This palace of Phæstos is contained in a vast rectangle, obvious at first sight. There has been an earlier structure, but the building now revealed is of one character and period—that of the acme of the "Mycenæan" age in Crete. The visitor, approaching from the north, sees, from a terrace, the ruin below distinguished into three main quarters. On his left a broad stairway descends to a spacious paved court, containing an altar and tiers of stone seats built up against the rock, evidently to hold an assembly. Flanking this on the east and raised high above it is the main building, entered by a truly majestic flight of steps, extending the full width of the fine pillared hall at their head. But the entrance from without is from the opposite side, where a second and larger paved court stretches to the brink of the precipice. Thence is admittance not only to the pillared vestibule and main hall, but to a double rank of galleries, and a maze of small chambers to southwards, which form the third quarter. This great court, round which the walls and doors are admirably preserved, vies with the region on the west, where the two main stairways meet, as the best point of view on the site. To one standing in it the uses of the various blocks about it are manifest. Here were the living and sleeping rooms of men, there of women. Their common hall of assembly occupies half another side; the store galleries for the produce of the plain fill the other half. In the chambers to south they bathed, worshipped and lodged their retainers and their beasts.

All this is constructed of an excellent limestone, which has retained its sharp and square outlines, while the Knossian gypsums have crumbled and collapsed. The general impression, therefore, is the more convincing. But in details the inferiority of Phæstos is unquestionable. The elaborate frescoes, the sculptured friezes and the delicate plaster relief of Knossos were never here. Phæstos was provincial. It could command good stone and good masons, but not the materials or the men for the more subtle crafts. The noble shell was decorated only in the rudest manner, and its ruin is not comparable to that of Knossos as a museum of art. On its plastered walls appear none but conventional patterns of

primitive sort: the only sculptured thing of any note yet found is a fragment of shell; the clay vases are interesting, but of common ware, and fine stone vases have not come to light at all: trinkets in the precious metals or stones have not been found, and two small tablets make a poor show beside the immense clay library of Knossos. Indeed, all the smaller finds are conspicuously wanting. For example, clay impressions of lost signet intaglios, a most valuable class of which Knossos has yielded to Mr. Evans scores of admirable examples, and Zakro some hundreds to me, remain unrepresented among the Italian discoveries.

Certain problems raised by these mid-Cretan excavations it was hoped would be resolved by exploration in the east of the island, the reputed home of the Eteocretan aborigines. There a non-Greek tongue long survived, and at Præsos a short inscription, couched in this language, but in Greek script, had actually been found. The further exploration of that site by the British School of Athens has indeed resulted in a second inscription, broken and imperfect, but containing more words. But no writing in the primitive scripts has come to light there, nor indeed anywhere else in East Crete but at Zakro. Nor has Præsos, while yielding to Mr. Bosanquet several notable objects, been fruitful of anything else having much bearing on the prehistoric problems. Its remains seem to be the leavings of earlier plunderers on the site of a comparatively wealthy community of the Hellenic and Hellenistic ages.

What the Eteocretan capital, however, has failed to produce has come in abundance from two unknown sites, Zakro and Gorynia. These, to compare small to great, stand to one another as Phæstos to Knossos. Gorynia is the more complete and comprehensible. Indeed, it is the most perfect example yet discovered of a small "Mycenæan" town, unconquered with later remains, and at this moment after the two great palaces, it is the "sight" best worth visiting in Crete. It lies on the deep gulf of Mirabello, at the head of the lowest and shortest pass to the south coast. Unobserved till now, though close to the main road from Candia to Sitria, it was discovered by the perseverance of the American lady, Miss Harriet Boyd, who has been directing its excavation. Her workmen have now laid bare two narrow and tortuous streets, paved, and here and there ascending by flights of steps, on either hand of which are preserved to a considerable height houses of stone with party-walls of brick. This style of structure, often suspected on Ægean sites, has never been actually found before. The two streets converge towards a large building of fine masonry, on the highest point of the knoll, in which it is easy to recognise the house of the local chieftain or governor. The contents of these buildings are as interesting as their structure. If almost everything in precious metal has vanished, everything in bronze seems to have remained, in the shape of weapons, tools and vessels. Among the many clay vases occur complete specimens of types previously inferred from fragments only; and among the chambers is one which, from the objects and symbols found in it, may safely be inferred to have been a small shrine.

These houses, however, and their contents, though the more intelligible from belonging all to one primitive epoch, are, for that reason, less instructive than the scantier remains which I found at Zakro. For these illustrate all the immense interval between the Neolithic and Hellenic ages. Zakro lay (and lies) remote from any centre of civilisation, behind high mountains on the extreme south-east angle of Crete. But every captain of sailing craft in the Levant knows its safe bay, and there the sponge fleets, bound in spring for the Libyan shore, muster, take in water, receive the blessing of a priest, and await a favouring norther. It is not wonderful, therefore, that the little plain of Lower Zakro is full of primitive remains, mostly like those of Gorynia, illustrating the close of the "Mycenæan" age. There are, however, earlier things, for a pit in the limestone rock had been filled with discarded vessels in clay and stone belonging to a previous epoch. Vases in a delicate painted fabric of the same type as the "Kamâres" ware of mid-Crete occurred here, but they seem more deeply affected by foreign influences. The caves about the plain contained still earlier evidence, having been used for sepulture in an age verging on the Neolithic. But the native objects from all these sources are mixed with elements of outside origin, parallel to things Cypriote and Egyptian.

The main site has suffered greatly from denudation, but the ruins of the town show it to have been of more massive character than that at Gorynia. The houses have like party-walls of brick, but their outer walls are true cyclopean. They are also of great size; one, for example, was found to contain over twenty chambers, and, utterly ruined though it was, it yielded over seventy vases besides many fragments, and objects in silver, bronze and stone. The most productive structure lies on the crown of the knoll, a fragment of a large group of connected blocks, which probably formed the residence of the chief. In one room of this were found not only the two inscribed tablets mentioned above, but a deposit

of bronze implements and vases, among which one with decoration of shells and marine stars may claim to be the most graceful of "Mycenæan" ceramic products. Here, too, were found the hundreds of impressions of lost signets already alluded to, lying in a heap as if once contained in a box, long ago perished. The separate types represented number 150, and illustrate in a remarkable way not only late "Mycenæan" glyptic art, but also "Mycenæan" religious symbolism. For instance, we note several bull-headed human figures, associated in two cases with women draped in the typical flounced skirts of the period, pre-Greek Minotaurs and Ariadnes. So well preserved are these impressions that it has been possible to take casts of them for study in England.

The general result of East Cretan exploration seems likely to establish the fact that the Pan-Ægean civilisation, which it is agreed to call "Mycenæan," was foreign in that part of the island, and that the native civilisation, existing before and coincident with it, was much ruder than, and perhaps of different character to that of mid-Crete. If this be really the case an important inference must be drawn, viz. that the Knossian tablets have probably nothing to do with the Præsos inscriptions, and that the non-Greek language of the latter, if ever interpreted, will supply no key to the most interesting puzzle that Cretan excavation has supplied.

RECENT DISCOVERIES IN ARMENIA.

EXPEDITIONS have recently been engaged in exploring the ruins of Armenia on behalf of the German Government. The first of these was under the direction of Dr. W. Belck in 1891, and he likewise conducted a second course, in which he was assisted by Dr. C. F. Lehmann, in 1898-99. The reports of these expeditions, which are now issued, contain most important discoveries.

The history of the Armenian kingdom is an extraordinary example of the recovery of a nation, all traces of which had been entirely lost. Similar results have taken place with regard to the Hittites, the people of Mittani or Northern Mesopotamia and the pre-Hellenic inhabitants of Crete. But the present is an age of resurrections. The restoration of the history and the civilisation of the pre-Aryan race of Armenia is, however, most important, as it fills up a gap which has long been open in any attempt to reconstruct the history of Western Asia.

It is evident that in the latter part of the tenth century B.C. the Assyrian kings pushed their forces into the mountains of Uratu or Ararat (as the country was then called). They invaded the regions round Van, and exacted tribute from the King Sardur. To commemorate these victories the Assyrian monarchs carved upon the rocks of Tebenek-su and other places near the head waters of the Tigris, long inscriptions. These incited the Vannic kings to have similar records, but they possessed no script of their own. Assyrian scribes were accordingly employed to cut them, and both Sardur I. and Ispurnis (the contemporary of Samsi-Rimman, king of Assyria B.C. 825-12) had such inscriptions carved. The Armenians soon adapted the Assyrian syllabary to their own tongue, and Mermas, who reigned with Ispurnis for a time and then succeeded him, placed his records on rocks all over the country, no less than seven long inscriptions of his having been copied by the German expedition.

The capital of the empire at this time was Van, known then as Duspuria (the modern Topsh), but it was also known as Khaldistun, from the national name Khaldini, the Khaldai of Xenophon and Herodotus. The chief royal residence was in the palace temple, the ruins of which are known as Toprak-Khalah. This site was partially explored by Mr. Hormuzd Kassam, and the British Museum possesses some shields of Rusas and Argistes, kings who ruled there about B.C. 700-660. But the German expedition has brought to light many inscriptions and some fine bronze shields and part of an altar, all now in the Museum at Berlin. There was also a fine Hittite inscription, no doubt captured by King Mermas in his wars with that race.

The remains of Armenian art are extremely interesting, as, like the writing, the style has been borrowed from the Assyrian; but the winged bulls, the lions and the curious thrones supported by lines of captives (similar to the throne of Sennacherib in the Lacish sculptures) are all somewhat conventional. It is, moreover, important to note that these conventional forms are reproduced in the Persian sculptures at Persepolis. It is impossible that Persian art could have been borrowed direct from Nineveh, and in Armenian art we have manifestly the connecting link. In the same way it was the Armenians who first taught the Persians to set up rock inscriptions. On the fortress at Van there is a tablet with a trilingual inscription of Xerxes, but it was really cut for Darius, and it was probably during the suppression of the Armenian revolt that the Persian king saw this, and formed the desire to have such an inscription. The Behistun text is certainly later. A fine copy and photographs of this were obtained by Dr. Lehmann.

KING'S COLLEGE, LONDON.

THE following prizes given by the Carpenters' Company have been awarded in the Division of Architecture at the recent examination:—

Architectural History (third year)—Silver medal and prize of 2*l.* in books, Stanley Churchill Ramsey (*Occ.*). Architectural Studio—Silver medal and prize of 2*l.* in books—Stanley Churchill Ramsey (*Occ.*); bronze medal and prize of 1*l.* in books—Gilbert Warren Rogers (*Occ.*); bronze medal and prize of 1*l.* in books, Leslie Kenneth Wright (*Occ.*). Architecture and Building Construction—Silver medal and prize of 2*l.* in books (second year)—Alfred Henry Bristow; bronze medal and prize of 1*l.* in books (second year)—Thomas Harry Vitty; silver medal and prize of 2*l.* in books (first year), Frederick Richard Fairmaner; bronze medal and prize of 1*l.* in books (first year), Stanley Churchill Ramsey (*Occ.*). Architectural History—Professor's prize for best note-books (third year), Gilbert Warren Rogers. Building Construction—Professor's prizes for best note-books (second year), Luis Baldasano-y-Lopez; (first year), José P. Katigbak and Alfredo Rodriguez (*eq.*).

Certificates were granted as follows:—Building Construction (second year)—William John Marlow and Oliver Charles Thompson, certificates of distinction; Arthur Henry Imber and Ernest Arthur Soames (*eq.*), John Gardner and Edouard Karam (*eq.*), Edward Woodward and Robert Melville Smith, George Purdon Geen and Harold Osmond (*eq.*), and Herbert Charles Swayne, certificates of merit; (first year)—Reginald Victor Gregory and Thomas John Rawsom Kiernan, certificates of distinction; James Howard Priestley Bilbrough, George Henry Rutland, George Wright Norton Rose and José P. Katigbak, certificates of merit. Architectural History—Gilbert Warren Rogers, certificate of merit.

TESSERÆ.

Jewish Architecture.

THE Hebrews borrowed from the art of every people with whom they had relations, so that we encounter in the few extant remains of their architecture Egyptian, Assyrian, Phœnician, Greek, Roman and Syrian-Byzantine features, but nothing like an independent national style. Among the most interesting of these remains are tombs of various periods, principally occurring in the valleys near Jerusalem, and erroneously ascribed by popular tradition to the judges, prophets and kings of Israel. Some of them are structural, some cut in the rock; the former (tomb of Absalom, of Zechariah) decorated with Doric and Ionic engaged orders, were once supposed to be primitive types of these orders and of great antiquity. They are now recognised to be debased imitations of late Greek work of the third or second century B.C. They have Egyptian cavetto cornices and pyramidal roofs like many Asiatic tombs. The openings of the rock-cut tomb have frames or pediments carved with rich surface ornament showing a similar mixture of types—Roman triglyphs and garlands, Syrian-Greek acanthus leaves, conventional foliage of Byzantine character, and naturalistic carvings of grapes and local plant life. The carved arches of two of the ancient city gates (one the so-called Golden Gate) in Jerusalem display rich acanthus foliage somewhat like that of the tombs but more vigorous and artistic. If of the time of Herod or even of Constantine, as claimed by some, they would indicate that Greek artists in Syria created the prototypes of Byzantine ornament. They are more probably, however, Byzantine restorations of the sixth century A.D.

Choragic Monument of Lysicrates.

This interesting monument consists of a circular building surrounded by a colonnade of the Corinthian order, resting on a square base, and surmounted by a cupola. On the top of the cupola, which appears to imitate a covering of leaves, is a sort of flower, similar to a Corinthian capital. The ornament on the top, the cavities for the reception only of which are now remaining, appears to have been a tripod. The frieze, by the sculpture on which travellers appear to have been puzzled, is ornamented with a variety of figures; the story they are intended to represent Stuart explains to be Bacchus and the Tyrrhenian pirates, the scene of action being on the seashore. On the architrave is a curious inscription, which has been translated as follows:—"Lysicrates, the son of Lysithides, of Cicynna, exhibited a musical instrument; the boys of the tribe of Achamas gained the victory; Theon was the flute-player; Lysides of Athens composed the play; Euenetus was Archon." From the Fasti Attici we learn that this was in the second year of the 111th Olympiad. From this inscription, compared with another which is recorded in the life of Themistocles by Plutarch, Stuart infers that the game mentioned was not an

athletic combat, but a musical or theatrical entertainment. The prizes obtained were called choragic tripods, since they were bestowed on such choragi as had exhibited the best musical or theatrical entertainments.

The Venetian School.

Chiaroscuro and colouring, being but varied effects of the same medium, assimilate so kindly together, that since the time of their junction at Venice, no school and scarcely any individual artist has existed who has been eminent in one of those branches, without at the same time possessing considerable excellence in the other. By this union, aided by the introduction of oil-painting, which supplies, through the medium of glazing, richer, deeper and more perfect shadows and tones than any other method, the Venetians were enabled to give that clearness, force, relief—in short, that perfect illusion which amounted in their limited conceptions of the subject to a complete representation of nature. Their conceptions were limited because, though "the gorgeous East, with richest hand," showered pearls and gold into the lap of Venice (and painting was, in consequence, liberally and enthusiastically encouraged), she possessed no remains of antique sculpture to elevate the imaginations of her artists, generate ideas of true beauty and lead them to attempt combinations of greater purity and consistency than are to be met with in ordinary life. Acquainted more with Asiatic luxury than with Grecian taste, the painters of Venice sought rather for magnificence than grandeur, are more remarkable for splendour than for elegance, and possess more truth of effect than refinement or character in their works. Correctness of design being in no wise necessary to illusion was, of course, neither attempted nor thought of by them, and painting, under their tuition, instead of speaking an universal language, equally intelligible to all nations and in all ages, only learned to speak with surprising volubility her mother-tongue. It cannot be denied that they painted nature, but it was nature in its everyday dress, disfigured by accident, unchosen, unimproved and "sent to its account with all its imperfections on its head."

Polygnotus the Painter.

The first great name of that epoch of the preparatory period of painting in Greece, when facts appear to overbalance conjecture, is that of Polygnotus of Thasos, who appeared in Athens about 463 B.C., and who painted the Poecile at Athens, and the Lesche, or public hall, at Delphi. Of these works, but chiefly of the two large pictures at Delphi, which represented scenes subsequent to the eversion of Troy, and Ulysses consulting the spirit of Tiresias in Hades, Pausanias gives a minute and circumstantial detail, by which we are led to surmise that what is now called composition was totally wanting in them as a whole, for he begins his description at one end of the picture, and finishes it at the opposite extremity, a senseless method, if we suppose that a central group or a principal figure, to which the rest were in a certain degree subordinate, attracted the eye. It appears as plain that they had no perspective, the series of figures on the second or middle ground being described as placed above those on the foreground, and the figures in the distance above the whole. The honest method, too, which the painter chose of annexing to many of his figures their names in writing, savours much of the infancy of painting. We should, however, be cautious to impute solely to ignorance or imbecility what might rest on the firm base of permanent principle. The genius of Polygnotus was, more than that of any other artist before or after—Phidias, perhaps, alone excepted—a public genius, his works monumental works, and these very pictures the votive offerings of the Gnidiens. The art at that summit, when exerting its powers to record the feats, consecrate the acts, perpetuate the rites, propagate the religion or to disseminate the peculiar doctrines of a nation, heedless of the rules prescribed to inferior excellence and humbler pursuits, returns to its elements, leaps strict possibility, combines remote causes with present effects, connects local distance and unites separate moments. Simplicity, parallelism, apposition, take place of variety, contrast and composition. Such was the Lesche painted by Polygnotus, and if we consider the variety of powers that distinguished many of the parts, we must incline to ascribe the primitive arrangement of the whole rather to the artist's choice and lofty simplicity than want of comprehension. Nature had endowed him with that rectitude of taste which in the individuum discovers the stamen of the genus; hence his style of design was essential with glimpses of grandeur and ideal beauty. Polygnotus, says Aristotle, improves the model. His invention reached the conception of undescribed being in the dæmon Eurynomus; filled the chasm of description in Theseus and Pirithous, in Ariadne and Phædra, and improved its terrors in the spectre of Tityus, whilst colour, to assist it, became in his hand an organ of expression. Such was the prophetic glow which still crimsoned the cheeks of his Cassandra in the time of Lucian.

NOTES AND COMMENTS.

THE outcry about the condition of St. Paul's has had one important effect. Public opinion exercises an influence on Parliament, and any shrewd solicitor or agent with experience in the conduct of private Bills must know that no line of railway would be allowed to succeed in a committee-room of the Lords or Commons which proposed to run through the strata on which the cathedral is built. One scheme of the kind has been abandoned, and it is proposed to modify the plan of another in such a way as to remove any likelihood of danger. The determination to keep St. Paul's safe which has been already so efficacious must surely convince the Dean and Chapter of the wisdom of their policy in playing with decoration while dangerous forces were undermining the structure. It is possible, moreover, that the danger was not entirely caused by underground railways. Sir BENJAMIN BAKER, in a recent letter, says:—"It may be well for me to state on the basis of the experience gained in driving more than 20 miles of 'tubes' that no such settlement ever has occurred or ever can occur with the cast-iron tube and shield construction carried out with the usual precautions. Bow Church steeple is 1 foot 9 inches out of the perpendicular, not on account of the Central London Railway, but because WREN ventured to build a tower over 200 feet high on no better foundation than an old Roman paved road, the stones of which, judging from a similar road which I came across in constructing the Metropolitan Railway, in all probability rested on consolidated mud with occasional layers of brushwood." The appearance of defects in the walls of St. Paul's, it is true, was manifested after the District Railway had been for some years in operation. But engineering authorities do not agree that the excavation of the latter was the cause of the evil. WREN, it should be recollected, was no more than an able amateur, and there is no evidence to show that he made a special study of foundations, or instituted experiments like those which would be carried out if a similar building were now to be erected.

THE late GUSTAVE MOREAU was a painter who never was appreciated by his countrymen as he merited. He seemed to have taken a lesson from the system of the English pre-Raphaelites. Instead of laying on his colours boldly and with broad strokes, he preferred to work up a picture by a series of most delicate touches. His pictures were very brilliant, but it was thought there was too much labour in them, and that he had not learned the art of concealing his art. Modern life had also little charm with him, for he preferred to draw inspiration from old legends, poems and chronicles. If his works were better known in this country they could hardly fail to be favourites. MOREAU possessed one friend, or rather worshipper—a writer, M. RUPP—who was grieved by the general lack of admiration of the painter's works. He resolved that posterity at least should be able to judge of the greatness of a genius who, although he was a member of the Institut, never succeeded in obtaining from his brother artists a higher reward than a second-class medal. M. MOREAU was not only laborious in painting, but he devoted a long period to making preparations for every picture he produced. In the course of fifty years some thousands of these designs, studies and other drawings were accumulated, and they were left, with the house where the painter lived in the Rue de la Rochefoucauld, to M. RUPP. He resolved to constitute the property as a GUSTAVE MOREAU museum or gallery. But the State and the municipality already possess so many institutions of the kind in Paris, there was no desire to accept the gift. M. RUPP resolved, therefore, to bestow a sufficient sum to enable the authorities to undertake the charge; this will amount to nearly 15,000*l.* Paris will consequently be enriched by a collection which must always have a special interest for artists. M. RUPP's generosity is enough to refute the cynical theories about the non-existence of friendship that imposes self-sacrifice.

THE history of Carthage was better known than its position. Ruins were found on the coast which indicated Roman Carthage, which was the first city of Roman

Africa, but it was, and to some extent still remains, doubtful whereabouts the great commonwealth which so long defied Rome was to be found. From the explorations which are in progress by the French Government, under the direction of M. GAUCKLER, we may expect that many of the uncertainties will be removed. The ancient cemetery of Desmesch has for some time been the scene of excavations. All that were discovered, however, were several Punic and Roman graves. Recently a more important find has been made. The ruins of a great building of the late Roman period have been disclosed. It is now evident it was surrounded by a wall of great thickness. The water supply was a serious consideration, both with Carthaginians and Romans, and for a long time the only memorials of the renowned state were the remains of its cisterns. An immense cistern has been found which formed part of the theatre, and probably was occasionally used as a property-room. There is much confusion in the intermingling of the remains, but enough has been brought to light to show the grandeur of the theatre. The building was evidently adorned with columns of vert-antique and other costly marbles. The name of the building appeared on the front in bronze letters, which were gilded, and the builders were apparently called VIGELLIUS SATURNINUS. M. GAUCKLER has been also fortunate in revealing, besides numerous fragments of inscriptions, no less than seventeen marble statues of deities and emperors, which have, however, suffered from the action of time and vandals.

ILLUSTRATIONS.

THE NEW CATHEDRAL, WESTMINSTER.

THE progress of the work at the new Cathedral can be judged from the view given this week. Owing to the position of the site, which is behind the lofty houses in Victoria Street, residents in London are not acquainted with the character of the building unless from occasional paragraphs in the newspapers; while to country visitors that part of London is an unknown region. It will be seen from the amount of work executed there is a possibility of having the Cathedral sufficiently advanced to allow of its opening in next July. But the decoration, which is so essential a part of every building in the style adopted, will require many years to accomplish. The erection of a structure 360 feet in length, and in a style that was novel to builders, was an ambitious undertaking, especially when it is remembered how poor are the majority of the people belonging to the Roman Catholic Church. The numerous and large subscriptions which have been received have justified the courage of Cardinal VAUGHAN and those who shared the responsibilities which so vast a building imposed. That Mr. J. F. BENTLEY was capable of successfully designing a remarkable structure would not be doubted by any architect who had seen his churches, colleges and schools in the Mediæval style. Moreover, he has shown himself to be a master of detail, and skill of the kind is indispensable in such a building as the Westminster Cathedral, which will contain so little that can be considered as familiar to architectural sculptors or other ornamentists.

NEW ACADEMY, LINLITHGOW.

THE foundation-stone of the new Academy for Linlithgow was laid by the Earl of HOPETOUN. The style adopted is the Scottish Baronial, simply treated. The outstanding features are two circular towers at the principal entrances, after the style of the round towers of Holyrood and Falkland Palaces. There is a large main hall for examination purposes, and in two of the classrooms provision for the teaching of science and cookery. The front elevation faces to the south, with a slight angle to the west. The building, including the laying-out of playground and the erection of a wall round it, cost about 7,000*l.* The architect is Mr. J. GRAHAM FAIRLEY, F.R.I.B.A., of Edinburgh.

CATHEDRAL SERIES.—CHICHESTER. CAPITALS, SOUTH CHOIR AISLE.

SKETCHES AROUND WARWICKSHIRE.

INGATESTONE.*

IN Ingatestone we have a very good centre; within a radius of four or five miles we have Mountnessing, Stock, Margaretting, Blackmore, Chipping Ongar and Chelmsford. A stroll through the town cannot fail to give points to all of us. The varied styles of building, and often old-fashioned customs we find in its houses, the undulations of its roads, the little jutting-out steps which are possibly intended to hinder the hurrying man, the curious mixture of the trades carried on in the same shop, the charm of foliage interspersed, and above all the splendid brick tower of the church with its own glorified colour in the western sunlight, appeals to all alike, only in such different wise that nature alone can appeal in to every human being, to each individual mind.

From the town to the Hall is but a short walk through

INGATESTONE HALL.

characteristic Essex roads, which are not flat in accordance with the popular idea of them. Under shady trees, through the avenue to the Clock gateway, with its motto, "Sans Dieu rien"—without God nothing—above us, and we reach the ancient Hall of the Petres.

There is little fear that we shall meet Lady Audley or the ghost of her husband as we approach the lime-tree walk to the south; but should we do so we pass her ladyship with whatever feelings and views of her conduct we choose, and we arrive in front of the house. We look around and can see for ourselves that we are in a large square or quadrangle, three sides of which only remain. Morant says that the scarcity of building materials in Essex is believed to have been the cause of the destruction of many of its architectural antiquities; this probably was one of the causes, but there has been a lack of reverence for old work in every period of building—the old has had to make way for the new, from the Roman to the Norman, from the Norman to the Early English and so on to the degraded taste in such matters of the Georges. There is now a strong feeling and desire to look upon a building as it stood in its newness 500 or even 800 years ago, as witness Hever Castle.

Ingatestone Hall was in the fifteenth century a grange belonging to the Abbey of Barking; it became part of the estate of William Petre, LL.D., in December 1539, granted to him by Henry VIII. in consideration of the sum of 849*l.* 12*s.* 6*d.*, and Sir William then made Ingatestone Hall his residence. It had been of course monastic property, and little is known of its early history, but it has fared better than many others, which were allowed to fall into ruin altogether and simply become a source of income to their owners as old building materials. The hall was originally built in the form of a double square, but is now greatly reduced in size. The family and servants occupied the south wing, the prominent feature of which is the octagon turret containing an oak staircase. The centre is now the chapel and the north wing is assigned to visitors. Modern considerations and the removal of the family caused a subdivision of the building into several much smaller but still roomy residences.

But the general outlines, the picturesque gables and octagon-shaped chimney-stacks, well-broken wall surfaces, which give so much light and shade, the mullioned and latticed windows, all tend to increase one's interest in the old pile, which somewhat reminds one of the older parts of Hampton Court.

I have already mentioned the turret staircase. Little change has been made here except that a roof of conical shape has taken the place of a flat one, with the embattled parapet.

* A paper read at Brentwood before the members of the Upper Brentwood Athenaeum by Mr. H. G. Quartermain on July 27.

The oaken steps and newel are as good as ever, and up this staircase we go, our guide proceeding to take us along a corridor, through a bedroom to a trap-door in a corner, which gives access by way of a step ladder to the priest's hiding hole. It must have been a dreary place to have remained in even for only a few hours—a narrow space of about 2 feet wide, but rather long (14 feet and 10 feet high), with no light and with little air, and only a sanded floor. For a seat there was a long trunk or chest used at that time for secreting vestments, altar furniture, books and perhaps the sacred vessels. Discovery meant certain punishment, and perhaps death.

Such, however, was the place, when in 1855 it was reopened, and there was found a chest with a rounded top used for the above purpose; beside a packing case directed "For the Right Honourable the Lady Petre at Ingestall Hall, in Essex." The Petre family left the Hall between 1770 and 1780.

Newcourt says:—"William Petre, LL.D., ancestor of the noble family of Petre, having grown so eminent in his profession in the time of Henry VIII., he was employed in divers important affairs, especially in what conduced to the dissolution of religious houses, and as a reward for his services obtained grants of their possessions, of which this manor and advowson of Ingatestone were a part."

But in Queen Mary's time, with whom he was in no less esteem, discerning that the restoration of the Romish religion might endanger his enjoyment of those abbey lands, he got a special dispensation from Pope Paul IV. for retaining them on promising to employ them for spiritual uses; one promise to Ingatestone was to build an almshouse for twenty poor people, with allowances of 2*d.* a day, to each a winter gown and two loads of wood, and amongst them all feeding for six kine winter and summer, also a chaplain to read service daily.

Sir William had been Secretary to the Privy Council to four kings and queens (Henry VIII., Edward VI., Mary and Elizabeth) and seven times an ambassador in foreign parts. He died January 13, 1572, and lies buried in the parish church.

The almshouses, founded in 1577, were removed by the railway company, and others erected on a new site.

In 1565 Sir W. Petre added eight fellowships to Exeter College, Oxford, for the counties of Devon, Somerset, Dorset, Oxford, Essex, and any others in England in which he or his heirs might have lands or possessions. These are called Petrean. His second daughter became the wife of Nicholas Wadham, of Merryfield, Somersetshire, the founder of Wadham College, Oxford, and at his death she gave the manor of Fryening and the advowson of the church to that college. An enumeration of his lands and possessions as confirmed to him by a bull of Pope Paul, and as given by Morant, is too long to read now, but he had manors formerly belonging to Barking, London, Waltham, Colchester, Westminster and many other abbeys.

CHURCH PORCH, MARGARETTIN

To see his monument and those of his immediate descendants we must go into the church, of which I now proceed to give some poor description. In the north and south chapels of the church for more than two centuries members of the family of Petre have been buried, and in them are contained some very handsome monuments to their memories.

The church is, as a writer remarks who has greatly assisted me by his careful work on some Essex churches, "worthy of attention, if only for the magnificent brick tower and stately monuments within its walls." It is dedicated to the Virgin Mary, and consists of west tower, nave, south aisle, chancel, with north and south chapels.

We have seen the red brick tower of Rochford Church, and some of us have seen that of Fryening close by, but the chief of them is Ingatestone. It is remarkable for its beautiful proportions and detail.

As it rises upward the builder-artist has diminished its outside size in all its storeys, the buttresses also following the same lines. Yet they are so arranged that perfect quoins or angles rise nearly to the full height. Its form by these methods is made most pleasing. Many towers appear to be top-heavy

ness, Avarice, Sloth, Lust and Anger, but for some reason the walls were fresh plastered; this work is lost to us.

There is a quaint Puritan hour-glass fixed where the pulpit used to stand. The bells are not so old as many we meet with, the earliest being dated 1610; they have quite recently been rehung. The roofs of the nave and south aisle are very good, and are now clear of the lath-and-plasterwork once covering them. The font is not remarkable. There are indications of the stairs to a rood-loft, and the arcading between the chancel and south chapel belonging to the Petre family is built of brick, although now hidden with plaster.

Now we come to the very handsome monuments already mentioned. The first on the south side under an arch is to the memory of William, Lord Petre, and Ann, his second wife, daughter of William Browne, a Lord Mayor of London. It is an altar-tomb of alabaster and choice marbles, beautifully carved with panels and columns and armorial bearings, on the top being recumbent figures of Lord Petre and his lady in the costume of the period. A charming bit of wrought ironwork, holding a marble escutcheon, fills up the arch over the tomb.

The walls of this chapel were either rebuilt or cased with

INGATESTONE CHURCH.

because they are built almost the same size at the top as at the bottom; but with this method the result is very satisfactory.

In building this tower you will observe that no other materials except bricks were used. They are the thin bricks generally met with, and five of them make but 12 inches in height, including the thick mortar joints. Our modern brickwork runs four courses to the foot. One of the charms of the work in this tower lies in the fact that no stonework was used for weathering the buttresses, as at Rochford, the effect of which is to make the building look "spotty." This brickwork has all toned down to the rich colour we see. Together with Rochford and Fryening, Ingatestone was being built about the same time in the fifteenth century. Brick was used for the arches and division mullions of the windows, with darker vitrified bricks for diaperwork decoration.

The belfry staircase is interesting in its construction. The interior of the church has undergone many alterations, and several objects of great interest have been destroyed. For instance, there was discovered some years back a painting generally known as a "Doom"; it was of circular form, over 7 feet in diameter, containing seven compartments, each with a figure-subject of a deadly sin, such as Pride, Perjury, Drunken-

ness, Avarice, Sloth, Lust and Anger, but for some reason the walls were fresh plastered; this work is lost to us. Another monument of costly marble to the memory of Robert Petre, youngest brother to Sir William (he died in 1593), is against the east wall—to the left of the chapel.

The north chapel, also called the Petre Chapel, was formerly used by them for burial; but, divided from the chancel by iron railings, is now used as a vestry. Against the west wall is another stately monument of the Elizabethan period, built of coloured marbles (said to be British), commemorating two generations of this family. John, Lord Petre, and his wife Mary, daughter of Sir Edward Waldgrave, and their son William, Lord Petre, and his wife Catherine, daughter of Lord Edward Somerset, Earl of Worcester, are recalled in side compartments.

Near by there is an altar-tomb to the memory of Mary, widow of Lord Robert Petre; she was the mother of three barons, William, John and Thomas, and died 1684-85, aged eighty-two.

Margaretting.

I must now attempt a brief description of the church of Margaretting. This to my mind is of surpassing interest, and I was tempted to bring you here to view an object which I

considered would form a great contrast to the ordinary stone or brick structure most churches consist of.

Morant says it is called Yng Margaret and Yng Magna. The name is derived from that of the saint to whom the church is dedicated, with the addition of the Saxon particle *ing*, referring to its rich meadow lands. The manor belongs to the Petre family, having been held by them since 1572. The church of Margaretting, formerly Yng St. Margaret, is an example of the early Perpendicular style—temp. Henry VI.—and is fairly complete. Its chief feature is in its spacious west tower, which unlike the majority of those we have the good fortune to visit in these rambles, is entirely built of oak timbers of very large dimensions, firmly framed and braced together, and presenting to the unaccustomed eye a most interesting and picturesque contrast to the ordinary four stone walls usually met with.

This tower gives support to a ringing chamber, a bell chamber and to a graceful spire, all of which are constructed in a most workmanlike manner, and possess an interest it is difficult to express in words, alike to the student and the archæo-

nave has been (probably when built) painted in square panels, like the eastern bay over the rood-loft, to represent clouds. The principals forming bold arches, with hammer-beams, collar and braces, were also painted, together with stone corbels, four of which represent St. Luke (an ox), St. John (an eagle), St. Matthew (an angel) and St. Mark (a lion), make up a very pleasing feature. The screen has been cut down and removed, but there remains enough for us to judge of the loss such a fine bit of work must be to the church. There is not much old glass; a few fragments remain in the north windows of the chancel, also in the east window and in the north window of nave, the colours of which are very fine. Some of the remains have been altered and made up of other fragments. The designs are in circles, each containing two robed figures of the patriarchs and prophets with their names inscribed on scrolls, among them being Asa, David, Ozee, Jonas, Roboam, Elind Obeht, Achim, Sadock, Salateil, Yyacc; amongst other fragments is the rose *en soleil*, the badge of Edward IV., and several quarries of the "herb-Margaret." All round this church you will find other points of interest, which time will not allow me to more than

MARGARETTING CHURCH.

logist. The body of the church is made up of the usual chancel, nave and south aisles and south-east chapel. But when we come to examine the south porch, which, like the tower, is also of oak timbers, we view one of those masterly specimens of carved decorative work which absorbs for the time our whole admiration. It is one of several examples remaining to us in the neglected county of Essex. Essex is particularly rich in such ornamental adjuncts, and although these may not be of equal importance to those in adjoining counties, they possess great interest to us. There is that beautiful one at Benfleet, Bloomfield and others; there are the seven round towers; again there are the timber towers of Stock, Blackmore, Mountnessing and Wix, all of which add in their own degree to the abundant architectural variety and wealth of this almost forgotten part of our country. There was, as an able writer described, a magnificent south porch, but the neglect of ages worked the ruin of this part of the building, and no doubt other portions would have gone too had not the ivy's picturesque but destructive growth been terminated. The roofs of both chancel and nave are very good, and similar to many other Essex roofs we have seen. That of the

note. The Perpendicular font is unusually high, 3 feet 11 inches, but its state is perfect. Several old open seats remain, likewise a square piscina, and the brick arch which opens between the nave and tower, to which I feel I must again refer. You will notice it is built in three divisions, as it were, a nave and side aisles; the clear space is 11 feet wide, and some of the timbers are 18 inches by 22 inches square; these are supported by arched pieces in the side spaces or aisles, acting as buttresses which support the spire.

You will notice the wooden west window and door, also the quaint memorial inscriptions in the floor.

Climbing up into the bell-loft you will find the four old bells in their original frames put together with oak pegs. Each bell has its dedication, some of the letters of which are crowned, such as the M in Margaret, whilst others show signs of an attempt to destroy the words which follow the name of each, e.g. that to St. John—Sancte Johannes, *ora pro nobis*—which is the smallest bell, and it is said to be the oldest bell in the country.

The access to the bell-loft is so easy and the light so good that all may see it and judge of the bells for themselves.

With these scanty remarks upon three very interesting places I must hasten to a conclusion, having a wholesome dread of what may fall from the lips of our editors, whose friendship may it ever be preserved to me.

The illustrations are from photographs by Mr. H. G. Quartermain, M.S.A., and Mr. Arthur J. Quartermain.

ROYAL ARCHÆOLOGICAL INSTITUTE.

(Concluded from last week.)

THE annual meeting of this Institute was concluded on Saturday and Monday, July 27 and 29, by the following visits:—

Newark Castle.

The members spent Saturday in Newark and the neighbourhood. Within the Norman gateway of the castle Mr. John Bilson, F.S.A., delivered an address on the history and architecture of the building. He said that the earliest mention of Newark was in a charter, marked, however, as doubtful, of the reign of Edward the Confessor, in which Newark was given to the church of Stowe, then a newly constituted church of secular canons, by Leofric, Earl of Mercia, and his wife Godiva. Remigius, the first Norman bishop of Lincoln, held the manor of Newark at the time of Domesday Survey. Robert Bloet, successor of Remigius, redeemed the lands, which had been given to Stowe, and Bishop Alexander (1123-47), nephew of Roger, bishop of Salisbury, erected the castles at Newark and Sleaford. Mr. Bilson referred to the surrender of the castle to Stephen by Alexander in 1139, to the siege by the barons under Gilbert de Gaunt, Earl of Lincoln, and to the death of King John in 1216. Tradition said that the monarch died in a room in the western tower, but there was nothing to verify this surmise. The fortress was visited by Henry VII. on his way to the battlefield of Stoke in 1487, and by Cardinal Wolsey in 1530 on his way to Southwell. The castle was then in the hands of the Bishops of Lincoln, but seventeen years later it alienated to the Crown, with whom it remained until a short time ago, when a lease of it was taken by the Corporation from the Commissioners of Woods and Forests. Newark took an active part in the Civil Wars, and in 1646 the earthworks were destroyed and the castle dismantled. The site of the castle was between the river and the Fosse way, and Bishop Alexander obtained a license to divert the road in order to obtain more space for his castle. A second license was obtained for the same purpose, and a third to build a bridge over the Trent. The castle area measured 294 feet along its western side, but the extent of it in other directions was doubtful. It was 84 feet from the north-west angle to the centre of the gatehouse, and the gatehouse might have been in something like the centre of the northern side, but there was no information as to the eastern boundary of the enclosure. It was protected by the Devon on the west, and no doubt by a moat on the other sides, with a barbican over the moat in front of the principal gatehouse, which was the finest part of Alexander's work remaining, and one of the finest castle gateways we had left. There were very few of these twelfth-century gateways remaining, and this at Newark was of unusual size. Mr. Bilson then proceeded to point out the chief architectural features of the gateway, remarking that there was some Decorated work in the upper storeys, which was exceedingly nice, like the work of Alexander's time, of which they saw a good deal in the western part of Lincoln Minster. In a little room off the terrace they would see a fragment that had lately been uncovered of zigzag moulding with a sort of ball between which was reused work of Alexander's time. There were traces of considerable rebuilding during the thirteenth century, to which period probably the hexagonal turrets might be referred.

Mr. Bilson then gave a description of the crypt, and pointed out other features of interest in the building. In answer to Mr. St. John Hope he said nothing was known of the keep. He did not think anybody had any definite information about any of the building except what they saw above ground.

Sir Henry Howorth expressed the thanks of the members to Mr. Bilson, and said they were indebted to him for having given them direct information without rhetorical phrases. With regard to the early charters in which Newark was mentioned, the fact of their being marked with an asterisk did not imply altogether that they were spurious, but that they were replacements of charters destroyed by fire and other means. He noticed that when they came to these castles they had elaborate descriptions of the stonework as it remained, and as they supposed it to be original, but he often wished attempts were also made to depict the wooden parts as they saw them preserved on the Moselle and in some parts of southern Germany.

Mr. Bilson acknowledged the compliment, and alluding to the beautiful oriel window said it was of the fifteenth century and had a coat of arms of three stags over it, but he did not know whose it was.

Hawton Church.

The party proceeded to Hawton Church, which was described by Mr. St. John Hope, particular attention being paid to the Easter sepulchre, one of the finest of its kind to be found anywhere, and to the richly decorated sedilia and other features of architectural interest, including the founder's tomb. At the Town Hall the church and corporation plate, together with the original grants of arms, were laid out for inspection and greatly admired.

Newark Church.

At the parish church an address was delivered by Mr. John Bilson. He said the church had been described in two papers read in 1856, one by Mr. Dimock on the documentary history, and the other on its architecture by Sir Gilbert Scott, both of whom had, in their opinions, been more or less followed by subsequent writers. In the main, he must follow their description, but there were certain points in regard to which it might not be too rash to differ from the conclusions then arrived at. He referred to the early history of the town in his paper on the castle. With regard to the church, Robert de Chesney, bishop of Lincoln (1147-67) founded the Gilbertian priory of St. Catherine, near Lincoln, and Newark was one of the churches which the bishop bestowed on his new foundation. Important works were undertaken. Fragments remained which might possibly represent the complete rebuilding of the earlier church. Alexander had built the castle, and they had seen the importance of its connection with Lincoln, and the priory might have had to do with the rebuilding of the church on a larger scale. The early fragments included the crypt, which consisted of two bays, and which presented in its features an interesting study of mid-twelfth century vaulting. Another fragment of the same date was the four pillars only complete on the south side next the nave, where they consisted of three shafts, the centre of which was larger than the two flanking ones. The capitals were characteristic specimens of the third quarter of the twelfth century. The four piers indicated a cruciform church, and Sir Gilbert Scott thought that their small size showed that a central tower was not contemplated or erected. He found it difficult to accept that view. The complete pier which existed meant an arch of 3 feet 8 inches in thickness, sufficient to carry a low lantern tower, while the walls of chancel, transept and nave would be a sufficient abutment to these crossing arches. The work of the western tower dated from 1230, and was designed on a grand scale. During the progress of the work the design was altered, and the tower, which was originally intended to stand clear, had aisles carried up to the western face. Of aisles thus carried up to the western face of a tower, the earliest example was at Conisborough, but the northern and eastern arches of the church of Tick Hill were more in line with Newark. Mr. Bilson went on to point out the gradual growth of the church, coming to the early part of the fourteenth century when the south aisle was erected, likewise the upper stages of the tower and spire. There was documentary evidence with regard to the south aisle, for in 1312 Archbishop Greenfield granted a license to Henry of Newark to remove a chantry chapel in the churchyard, and to convert the materials to the use of the church, and "the fabric of a certain aisle which it was proposed to construct anew." This proved the intention in 1312 to build a new aisle, but he thought the work was of a somewhat later character, though it was exactly in line with the extremely fine fourteenth-century work found in South Lincolnshire, and especially in the neighbourhood of Boston and Sleaford. The aisle was set out the same width as the nave, designed for a pitched roof, and was probably only just completed before the Black Death of 1349. The effect of the Black Death in Newark might be seen by a license to enclose a new churchyard. Of the later rebuilding after the Plague they had the nave, the north aisle and transept, and a chancel. There was little difference in detail in the work here; in fact, no difference in the north side until they came to the extreme east end, where there was a slight difference in moulding which might indicate a little later date. Documents showed that in 1460 payments were made for church work, and in 1483 Nicholas Cayser bequeathed money to the new building of the chancel "in case it should be built anew." The fourteenth and fifteenth-century builders modelled the church into a harmonious whole, working round the parts of an earlier date. The preservation of the early pillars was probably due to the fact that the work was undertaken in sections, and the pillars afforded a convenient point around which it could be carried out. Mr. Bilson went on to speak of the large number of chantries which existed and of the adornments of the church, noticing the reredos, the chantry chapels, the screen, and other features of interest.

Holme.

Mr. Bex spoke of the brasses, notably the Fleming brass, and thanks having been given to Mr. Bilson for his admirable paper the party left Newark for Holme, where an account of

the church was given by the Rev. A. F. Sutton. He said the estate was at one time in the possession of the Bartons, who had considerable property in Lancashire, and one of whom, according to Thoroton, built a fair stone house, and being a merchant of the staple, placed in the windows of it this poetry:—

I thank God, and ever shall,
It is the sheep that paid for all.

From the Bartons the estate passed to the noble family of Bellasis, the gallant defender of Newark, who died in 1689 and was buried at St. Giles-in-the-Fields, London. The church, some parts of which were of great antiquity, owed much to the Barton family, in whose chantry chapel was a raised tomb with effigies. The lower part of the tomb did not seem to belong to the rest, and the whole had the appearance of having been reconstructed. Under the arch was the figure of a skeleton with a winding sheet, of which there was a similar example in Lincoln Minster. There was an old altar slab with five crosses, and other interesting remains. Mr. Sutton described the porch, adorned with seven shields of arms, particulars of which were given by Bishop Trollope in 1871.

After a few remarks from Mr. Mickelthwaite and the vicar (the Rev. J. Barry), Mr. Sutton was cordially thanked for his excellent paper.

Worksop Priory Church.

On Monday the Priory Church, Worksop, was first examined. The Rev. H. T. Slodden, vicar of Worksop, said it afforded him much pleasure to welcome the members, and to show them the only relics of Mediæval times which remained in a town which was sadly becoming modernised in every sense. Parenthetically, he might mention that up to a year or two ago there existed, about a quarter of a mile from that church an old house, called Jesus House, which was supposed to have been connected with the priory as a sanatorium, but the building had given way to a modern cottage erection.

Before describing the architectural history of the church, Mr. Slodden gave a brief account of the ancient lords of the soil, with whose history the foundation and subsequent elaboration of the church was closely interwoven. For this purpose he quoted from a book by Richard Nicholson, the architect, who restored the church in 1850. The Manor of Worksop, which had formerly been held by Elia, a Saxon, was given by William the Conqueror to a certain Roger de Busli, a man of great possessions, whose principal residence was at Tickhill, a few miles away. From him it passed to Sir William de Lovetot, who founded the monastery in 1103. The lordship continued in this family for three generations, when Matilda de Lovetot was married to a noble young Norman, Gerard de Furnival, who thus became lord of Worksop in the right of his wife. This Gerard de Furnival was a Crusader, and served under Richard I. The manor remained in this family till the time of Edward III., a certain Thomas Lord Furnival being present at the battle of Crecy. Thence, the male line being extinct, it passed to Sir Thos Merle, by his marriage to an heiress of the Furnivals. This lady left an only daughter, who was married to the renowned John Talbot, Earl of Shrewsbury (vide Shakespeare's Henry VI.), and from this family the manor passed, in 1617, to the Howards, the family of the Duke of Norfolk, with whom it remained until 1837, when it was purchased by the Duke of Newcastle. The present Duke of Newcastle sold the manor estate a few years ago, but still retained the manorial rights. In passing, it might be mentioned that at the coronation of the Sovereign, the Lord of the Manor of Worksop was to find the king a right-hand glove, and to support the Sovereign's right hand so long as he held the sceptre, and this service was performed at the coronation of the late Queen Victoria by the Earl of Surrey, acting as proxy for his father, the Duke of Norfolk.

In describing the building Mr. Slodden said that the nave of the church was dedicated to St. Mary and St. Cuthbert, and was originally cruciform, the eastern end or choir, together with the transepts, being used by the monks for their monastic services, whilst the nave was devoted to parochial purposes. The nave was 135 feet long, and the columns were alternately cylindrical and octagonal. The pillars were ten in number, and he believed that the two on either side of the extreme east end of the present building were pure Norman work. The rest of the church westward appeared to be of later date, probably about 1117, and it was possible that the choir was built first, the remainder of the original design being abandoned for a less massive style, and were, to his mind, less stately. Mr. Slodden also directed attention to the porch, and particularly to the beautiful ironwork on the lower part of the door. He went on to relate that when the monastery of Worksop was dissolved in 1537, the arches which terminated the nave and aisles were walled up and the windows at the east end added somewhere about 1560. The cloisters were on the north side, as was, he believed, the case only in Augustinian monasteries. A small piece of the cloisters remained, however, and this was now used as a vestry. The beautifully orna-

mented door on the western side was that through which the prior passed when entering the monastic part of the building near the north transept. The triforium was particularly beautiful, and seemed to have escaped the too complete renovation which was so conspicuous in the lower part of the church, restored about fifty years ago, before architects came to understand the proper canons of church restoration. The arrangement of the round-headed clerestory windows, he was told, was irregular, they being placed on the columns instead of over the arches of the nave. The roof of the church was formerly of oak and nearly flat, the present roof dating from the time of the restoration, whilst the font also was modern. As regarded monumental memorials, the church formerly was full of interest, having been the principal burying-place of the Lovetots and Furnivals. They had it on good authority that Thos. de Furnival, the heir of the family, who was slain in Palestine in 1237, was buried in that church, having been, according to an ancient writing, brought home and "tumulat" at Worksoppe, on the north side of the Minster. He was told that the architecture of the arch coincided with the date of Thos. de Furnival's death, but he thought it quite likely that it was the resting-place of one of the priors, as he noted the cross of St. Cuthbert on the slab. They had three figures in alabaster. A female figure which he had had placed at the western end of the church was supposed to represent Joan, wife of Sir Thomas Nevil, and heiress of the house of Furnival, who died in 1466; and one of the last of the Furnivals, possibly the Thomas, Lord Furnival, who was at the battle of Crecy.

After a close inspection of the interior of the church had been made, Mr. Slodden conducted the archaeologists to the interesting remains of the former monastic buildings on the north side of the church, observing that a string-course on the top of a piece of the old wall seemed to indicate that there had once been a building above it—possibly the dormitory. He said that the gem of the monastic remains was the chapel, commonly known as St. Mary's Chapel, at the eastern end of the south transept. When he first came to Worksop this building was in a dilapidated condition, and he called in an architect, who advised that a piece of rough masonry should be built up to keep the western arch from falling. The walls were, however, only pointed, and the building made secure. He had waited twenty years since then in the hope that some person of means might restore the building for use in the daily offices of the Church, but no one had yet come forward. The date of the chapel was about 1250, and might possibly have been built by Maud de Lovetot, who, by her marriage with Gerard de Furnival, carried the Worksop estate to that family. The chapel appeared to have been the burying-place of the Duke of Norfolk's retainers, which possibly accounted for the fact that it, alone of the monastic remains, had had more care bestowed upon it. Before leaving the ruins Mr. Slodden said there was a local tradition that much of the beautiful carved stone of the ancient monastery had been used for repairing the roads, and richly ornamented fragments had been found in all sorts of unfrequented places whither they had been carried by sacrilegious hands. In a brief account of the gateway, Mr. Slodden pointed out that the structure presented a gable to each point of the compass. On the south side was the porch which formed the entrance to the staircase leading to the large room above. In the richly canopied niche within the porch was a shrine with a figure—probably that of the Blessed Virgin. The porch was later than the rest of the building. The whole of the south front was full of detail, and was worthy of careful inspection. The interior of the niches on either side of the window contained the figures of the Virgin Mary and of St. Augustine, whilst in the gable was a figure of the Holy Trinity. But if the interior of the building had been beautifully embellished, the exterior was also possessed of the greatest charm until its ornamentation was ruthlessly destroyed. Even now they could just trace on the east side a sculpture of the Angel of the Salutation, and on the south side a representation of the Adoration of the Magi.

Blyth Church.

The party afterwards went to Blyth, where the church was inspected under the guidance of Mr. W. H. St. John Hope.

The priory church of Blyth, explained Mr. Hope, like the fragment of early architecture at Thurgarton and the magnificent nave at Worksop, owed its preservation to the fact that it was the parish church of Blyth as well as part of the old monastic establishment. A monastery of the Benedictine order was founded at Blyth in 1588. This monastery was an alien one, being dedicated to St. Catherine of Rouen. Nothing was now left of the monastic part of the church, and there was no material to guide in speculation as to what its original plan had been. From an examination of the existing building it seemed as if the church had been built straight away from end to end. On the north wall of the nave there were indications that the setting out was different from what they now saw, and instead of the compartments of the aisles being oblongs they should

have been squares. It was the earliest Norman work seen by the members of the Institute during the week. The elevation showed a storey of arches with the triforium and clerestory above, but, owing to the lowering of the roof, the triforium had been raised and turned into a clerestory. On the south side the groining was work of a much later date. The large south aisle was said to have been erected in accordance with the deed of endowment of the vicarage of Blyth in 1287, but there was no mention of the matter in the deed, and the probability was that the increase in the population of the place, and the fact that a large part of the church was required for monastic use necessitated an enlargement of the structure for parochial purposes. In the fourteenth century the parishioners seemed to come to the conclusion that instead of sharing a bell tower with the monastery they would have one of their own, and so they built one, a curious point in its construction being that instead of adding it to the existing structure, the builder encroached upon two bays of the nave, a parallel instance of which was to be found in Furness Abbey. There seemed to have been no reason why they should have followed such a plan unless there had previously been a fall of part of the building, or there had been no room in the churchyard for a further extension of the fabric westward. The tower was of graceful form and of good proportion, crowned with a very effective though roughly worked parapet of pinnacles and open work. As to the fittings of the church, the blank wall at the east end of the north aisle had been built up into the archway which gave entrance to the Mediæval monastic choir, destroyed with the other parts of the monastery at the time of the Dissolution. The screen placed under the extreme archway of this aisle was in all probability a good deal further east than it had been originally. The screen in the south aisle was formerly, as now, the rood-screen of the parish church. Among the monuments in the church were the interesting fragments of a tomb, with recumbent effigy of a knight of the period of Richard I. In the reign of Henry VIII. the priory was of the annual value of 125*l.*, and it was granted to Gervase Clifton, but the rectory of the church remained in the hands of the king until he made it over to Trinity College, Cambridge.

Mr. Micklethwaite, Sir Henry Howorth, and the Vicar of Blyth pointed out other points of interest. After these gentlemen had been thanked for their services, an external inspection of the church was made, and, by permission of Major Willey, of the fragmentary remains of the old monastery.

The concluding evening meeting, held in the Exchange Hall, was devoted to the passing of votes of thanks to the Mayor and Corporation of Nottingham for their reception of the Institute, to the owners of the historical houses, and the clergy of the churches visited; to those who had offered hospitality, to the authors of papers, to the officials, to the local hon. secretary (Mr. G. H. Wallis), the local committee, and all who had contributed to the success and interest of the meeting.

BASINGWERK ABBEY.*

DURING the Middle Ages devotees from all parts of Christendom were in the habit of visiting St. Winefred's Well. That a place of this religious celebrity should be long without its monastic establishment is hardly to be expected, as such a course would be contrary to the custom of the times. Accordingly we find that a society of monks did exist here previous to the year 1119, for it is said that Richard, the son of Hugh Lupus, Earl of Chester, was attacked by the Welsh on his pilgrimage to the Virgin's Well, and was obliged to take refuge in an abbey in the neighbourhood, but how long it had existed prior to that date we have no means of ascertaining. Nor is it known who the original founder was. The charters of Prince Llewelyn ap Iorwerth and his son David confirm several donations "to God, St. Mary, and the Monastery of Basingwerk," bestowed on them by their predecessors, and from this it may be inferred the founder was a native Prince of Wales. From King Henry II.'s charter to the abbey we learn that the primitive institution consisted only of a chapel in which the monks dwelt. It is probable the Cistercian order was introduced into Basingwerk by Randle, the second Earl of Chester, A.D. 1131. He was one of the greatest benefactors to the abbey.

In the "*Annales Cestriensis*," or Chronicle of the Abbey of St. Werburgh, at Chester, there is the following entry under the year 1157:—"In this year the Abbey of Basingwerk is founded." We are able thus to fix the date when the building (the ruins of which now lie before us) was erected. I will give you the description of the remains as they were in 1846 from the first volume of the "*Archæologia Cambrensis*":—

"The general style of the remains of this religious house is

the Early Pointed, corresponding closely in character to the time of Henry II., or the latter half of the twelfth century. The masonrywork is good and carefully finished, but there are very few traces of ornament remaining, not even any foliations being observable in the windows. The ruins consist of the abbey church, running from west to east, with a little deviation to the south, the refectory, abbot's buildings, barns and grange, and probably a portion of the porter's lodge. The church was cruciform, consisting of a nave, with a single aisle at each side, transepts without aisles, and a chancel, probably also without aisles. Of the edifice nothing is left standing except the southern transept and a few courses of the outer wall of the southern aisle. Nevertheless, from the traces of rubbish, &c., the plan of the church may be made out satisfactorily, except for the chancel. It is probable, indeed, that if some heaps on which trees now luxuriantly grow were dug into with proper precautions many valuable fragments and perhaps tombstones might be discovered. As far as can be guessed, then, from the present condition of the church, the nave was about 80 feet long by 25 feet wide, the aisles were 10 feet wide, the piers of the nave arches were circular or octagonal, massive and supporting bold arches very slightly pointed, like those of Buildwas Abbey; one pier and half an arch are still remaining. The transepts were 20 feet long by 17 feet wide; the northern one had probably lofty lancet windows below and three smaller lancets above in the gable, judging by the analogy of the southern transept, where the upper lancets remain. Against this southern gable the refectory set on so that no lower windows were there practicable, but a low circular-headed doorway, without any chamferings or mouldings, leads from the south-western corner of this transept into the refectory, while at the south-eastern corner of the southern aisle was a circular-headed doorway, with good mouldings and capitals to the shafts, leading probably into the cloisters. The chancel could not have been more than 25 feet or 30 feet long, and was probably as wide as the nave; no traces, however, remain whereby to judge of its architectural character, but the tenant of the adjoining buildings says that a few years ago a gable with three lofty windows fell down, and these might have been either in the chancel or the northern transept. There are no means of judging whether any tower sprang from the crossing of the aisles, but from the plainness of the remaining pier we should infer the negative. A very beautiful and unusual bracket or corbel occurs here, from which the main arch of the southern transept sprang. There was a doorway in the western end of the nave, but no traces are observable of any in the western ends of the aisles; the roof of the southern aisle had probably been altered in its pitch, if we may so infer from a double line of junction observable in the transept wall. The refectory, entered by a circular-headed door from the cloister, extended southwards from the wall of the southern transept, about 75 feet and 17 feet wide; it had the dormitory above, and both apartments were lighted by small lancet windows with very wide and bold internal splays. At the southern end of the dormitory the gable is pierced with three bold lancets still visible, though two had been blocked up by the monks, and the easternmost converted into a fireplace from the outside. Southward of the refectory must have been originally a small court, but this was afterwards occupied by buildings perhaps for the improvement of the abbot's house, for they consisted evidently of two storeys, and in the southern wall is still remaining a fireplace and two perpendicular windows, one of two, the other of three lights. At the north-eastern corner of the refectory was a room, or parlour, entered by two circular-headed archways, the central pier between them being longer than those at the sides, and standing in front of what seems to have been a hole in the ground, the use of which it is difficult to conjecture. This room, 13 feet by 17 feet, is lighted by three lancets in the eastern side and one in the southern, of bold internal splays and deeply cut labels. The roof was vaulted in stone, and above was an apartment approached by a staircase in the wall having a double-light window in the eastern gable and a doorway into the dormitory. The roof of the dormitory seems by the traces on the wall of the church to have been flat at top, and not to have run up into a ridge, at least at the northern end. Westward of the refectory are the remains of one or two apartments, the use of which cannot be assigned, and also a beautiful room or hall, which Tennant and Grose call the Chapel of the Templars. It might very well have been the chapter-house or library. It runs north and south, and was approached (to judge by Grose's view) by a doorway in the south gable under three or five lancet windows. In the western wall is a range of seven lancet windows of unequal dimensions, but of excellent design and workmanship; three of these must have continued to be used as windows till a late period, but the other four had been blocked up, perhaps by the monks. They were divided by banded shafts, have bold splays, and the heads of two of the splays are circular. There are brackets against the wall, showing that probably the roof was of timber, and

* A paper by Mr. Henry Taylor, F.S.A., read at the visit of the Chester and North Wales Archæological Society.

indeed the pitch of the gable was rather low. Eastward from this runs a long range of abbey barns, ending at the eastern extremity in a plain square stone building, which was no doubt the granary, and having a return towards the south, the gable of which still shows its post and pendant. All the lower storey of the barns was of stone, the upper of timberwork, brick or plaster. The beams of the room and walls are untouched, in excellent preservation, all plainly chamfered, and of unusually ponderous dimensions."

I have given this able description almost in full because it is evidently from the pen of some learned ecclesiastical architect and antiquary of half a century ago, and may be of assistance to those of you who are interested in the roof of the ancient church of St. Mary-on-the-Hill, at Chester, which is said to have come from here, and probably from the chancel or choir. You will remember the entry in the churchwardens' accounts of 1536, "also in their tyme (viz. that of the two churchwardens holding office then) the quere (choir) was bought at Besewerke, and sett up with all costs and chargis belonging to the same." There is also a legend that part of the roof of Cilcain Church came from Basingwerk. By taking measurements it may perhaps be possible to ascertain how far both these legends are correct. No doubt the roof of St. Mary's at Chester is Perpendicular work, but then Basingwerk appears to have had alterations and additions made to it about the time of King Henry VII. The late Mr. Loftus Brock, F.S.A., the learned architect of the diocese of Canterbury, in a paper read before the British Archaeological Association, said of Basingwerk:—"The style of the church is Early English of a good type, and when perfect of an excellent effect. The base of the south wall of the south transept seems somewhat earlier, and may be a portion of the 'small cell' which existed in the time of Giraldus Cambrensis. It has a small round-headed opening into the sacristy, a chamber, however, now quite destroyed, but we trace a round-headed and chamfered doorway which afforded entrance to it from the cloisters, and also a portion of a Perpendicular window eastward." This latter, like the roof, may have been made in the time of Henry VII. There is a tradition about this king with regard to church building and restoration in the neighbourhood. You will remember the Stanley family were very powerful in Flintshire and Denbighshire. Sir William Stanley, of Holt and of Flint castles, had rendered most valuable services to the king at the battle of Bosworth; yet upon suspicion of favouring the cause of Perkin Warbeck the king had him seized at his castle of Holt and beheaded. At that time the first Earl Derby of the Stanley family had married Margaret, the king's mother, so to soothe the feelings of his step-father he honoured him and his mother with a visit in 1495 at their castle of Hawarden for the amusement of stag-hunting, and, it is said, to show his repentance for the death of Sir William Stanley, he assisted with money the restoration of the churches of Wrexham, Gresford and Mold, as well as the little chapel over the holy well at Holywell, which in the time of Richard III. was served by a priest from Basingwerk, the abbot and convent being paid by the Crown ten marks annually as a salary for his maintenance.

In 1188 Giraldus Cambrensis, in the train of Archbishop Baldwin on his progress through Wales to preach the crusade, lodged a night in this monastery, and King Edward I. made Basingwerk his headquarters while he was building Flint Castle, but before then Henry II., as I have already mentioned, had been a good friend to the abbey. He became acquainted with the monks on his military expedition into Wales, and by a charter (the first witness to which was the great martyred Thomas à Becket, Archbishop of Canterbury) the king granted to them considerable lands in Glossop, Chatsworth and other parts of the Peak of Derbyshire, which they held at the time of the Dissolution, and both the native princes of Wales and their rivals, the earls of Chester, made them considerable grants of property. They had property at West Kirby and Caldy in Wirral. With respect to the right of presentation to the living of West Kirby, they had a long dispute with the monks of St. Werburgh at Chester. At Northwich they had a salt pit, at Chester, the Lache and Saltney; they also held property as well as the manor of Holywell, and their large possessions in this neighbourhood. Tennant mentions that the monks obtained for Holywell the grant of a market and fair, and that both had been lost until the former was renewed in 1703. On the Welsh Recognisance Rolls I find this grant in 1387, and by it the monks were allowed to hold the market every Thursday instead of Friday, as they were accustomed to do by a previous grant of Edward I. The pious monks evidently felt that it was a desecration of the weekly fast day that the market should be held on a Friday, but their good intentions are now frustrated by the townspeople of Holywell, who do their marketing on a Friday as their forebears did in the time of King Edward I. Tennant also mentions that he could recover the names of only two of the abbots, viz. Thomas ap David Tennant, in the time of Guttyn Owain, and Nicholas Tennant, the last abbot, but the Recognisance Rolls mention William in 1316, Ralph in 1351, Richard de Acton in 1362, Henry in 1395

and Henry de Wirehall in 1432. At the Dissolution, or soon after in 1540, the house and lands were granted to Harry ap Harry, whose only daughter Anne, by her marriage with William Mostyn, of Talacre, conveyed them into that family, who are the present owners. So late as 1647 burials took place here.

THE HOSPITAL OF ST. JOHN, BRISTOL.*

I HAVE for some time past been seeking to clear up the obscure history of St. John the Baptist's Hospital, formerly situated in what was called Redcliff Pit, and in some way connected with the neighbouring church of St. Mary, and propose to lay the result of my researches before the Bristol and Gloucestershire Archaeological Society, of which I am an unworthy member. But as the Hospital was formerly a Somerset institution, and may be of interest to some Somerset antiquaries, there will, I hope, be no great impropriety in my first communicating the chief facts I have collected before those who are now honouring this city with a visit.

The date when the Hospital came into existence cannot be precisely fixed. There is, indeed, a very definite statement in the last edition of Dugdale's "Monasticon," but it can be proved to be erroneous. Under the heading, "St. John's Hospital at Bristol," the writers say, "The chief which we know of the Hospital is from the founder's charter," and they proceed to reproduce a charter of King John, confirming a charter granted by him whilst Earl of Moretain, such grant being specifically made to the lepers of Bristol of a croft "extra portam Lacford" on the road to Bath. John's foundation is thus conclusively shown to have been in Gloucestershire, and was, in fact, the Hospital of St. Lawrence, outside Lawford's Gate, situated on what is now known as Lawrence Hill, and suppressed by Edward III. nearly 500 years ago. According to the Little Red Book of the Corporation of Bristol, the real founder of St. John's was one John Farceyn, alias Farcey. But the entry to this effect is near the end of that remarkable volume, upon a page of which the first two items are dated 1481 and 1475, so that the statement seems to be merely the record of a tradition. That the Hospital was in existence in the time of King John can, however, be proved beyond dispute. In the collection of local deeds belonging to Mr. Jerdone Braikenridge, of Bath, is a charter of Robert de Berkeley, Lord of Redcliff, who kept a gallows there handy for the summary punishment of felons. His lordship granted to the church of St. Mary Redcliff a well called Rugewell, with a proviso that the Hospital of St. John the Baptist should have a pipe of the dimensions of a medium-sized thumb for carrying water to their building. One of the witnesses of this charter was John, Abbot of St. Augustine's, who died in the last year of King John's reign. The deed was probably executed about 1207.

I have recently discovered in the archives of the Council House four more charters relating to the Hospital, of about twenty-five years later date, tending to show that the place was founded for the relief of lepers, inasmuch as its beneficent purposes were administered by a mixed community of men and women. In the mayoralty of James la Warre, who became chief magistrate in 1235, Elena Russell granted to the Hospital of St. John of Redcliff, and to the brothers and sisters thereof, a house in the Marsh of Avon, near Baldwin Street, and some adjoining land, in consideration of religious services to be rendered by the grantees for the souls of her late husbands, her children and others. By another charter of the same year this lady made a further grant to the brethren and sisters of all her land in the Marsh, reserving a small quit rent. A third deed, by Adam Havering, attested by several of the witnesses to the above charters, granted in the same way a yearly rent of 5s.; whilst a fourth (Jordan le Vieke) granted the Hospital all the land that his father had in Bristol Marsh. The next document, in point of date, which has also escaped the notice of local historians, and is of greater interest, inasmuch as it affords the only information now extant in reference to the erection of the Chapel of the Holy Spirit, formerly in the churchyard of St. Mary Redcliff, is dated 1254, and is in the archives of the Dean and Chapter of Wells. It is an undertaking of the master and brethren of the Hospital—the sisters apparently being held of no account—and sets off by stating that forasmuch as the late Henry Tessum, Precentor of Wells, and Prebendary of Bedminster in Salisbury Cathedral, had built at his own expense the Chapel of the Holy Spirit in the cemetery of St. Mary Redcliff, and had likewise given rents to the Hospital, the master and brethren undertook to support the chapel and to provide a secular chaplain, or one of themselves to serve therein daily, guaranteeing that the rector of Bedminster should suffer no loss thereby. The precentor's munificence was doubtless due to the fact that sufferers from leprosy, and those succouring them, were forbidden to attend

* A paper by Mr. John Latimer, read at the meeting of the Somerset Archaeological Society.

the daily services in parish churches. This chapel continued in use until the Hospital was suppressed, and remained in the hands of the Crown until 1571, when it was granted by Queen Elizabeth to the parish of Redcliff for the establishment of a free school. It was finally demolished in 1766.

From another document at Wells it appears that the dean and chapter in 1306 confirmed a grant made by their bishop, Walter de Hazelshaw, of a portion of the rectory of Backwell, Somerset, to the authorities of St. John's Hospital on account of their extreme poverty and starving condition. By another deed in the Council House, dated July 1322, Thomas, master of the Hospital, with the consent of the brothers and sisters, sold off some of the Hospital lands in Bristol Marsh, which seems to indicate that the charity was still in financial difficulties. Matters apparently went from bad to worse, for Barrett, without giving his authority, states that about 1442 the community was reduced to the master and a single brother. The history of the house for the next ninety years is a blank, but the place turns up again in 1534 in a manner characteristic of the age. Queen Anne Boleyn, during her brief reign of favour, followed the example of the courtiers around her, who habitually sold what influence they possessed to those willing to buy it, and on January 20, 1534, she addressed what was practically a mandate to the Corporation of Bristol, requiring them to confer the next presentation of the mastership of St. John's Hospital upon two of her servants and a Bristol grocer named Hutton, asserting that they would appoint a fitting person on the next vacancy. The Corporation obeyed the command with the utmost alacrity, their grant of the presentation, which is copied into the Little Red Book, being executed only four days later. Whether Mr. Hutton, who was doubtless the leading spirit in this transaction, got his money's worth for his money is uncertain. Nor can the date be precisely fixed when the Hospital came to an end, the deed of surrender to the king having perished. But proof exists that the Corporation made a vigorous but unsuccessful effort to secure the royal plunder. A deputation was sent off to Court, and the two members for Bristol are recorded to have taken great pains before the Court of Augmentations, for which the corporate body entertained them to a sumptuous breakfast for the small consideration of ninepence. Their exertions were of no avail, for in April 1544 Henry VIII. granted the Hospital and its estates to his physician, Dr. George Owen, reserving an insignificant rent. The buildings seem to have been demolished soon afterwards, and even 120 years ago Barrett was unable to find a trace of them. It is not improbable that the cemetery now belonging to the Society of Friends was adjacent to, if it did not form part of, the Hospital premises. At all events, a hermitage was founded there by Thomas, Lord Berkeley, in 1348, and the hermit's cell, one of the few remaining in England, is still intact, being cut out of the solid rock, and is approached under the original arch.

A few words illustrative of the increasing value of real property in Bristol will bring these dull details to a conclusion. After holding the king's gift for nine years, Dr. Owen, in May 1553, handed over the Hospital estates situated in Bristol to the Corporation, in trust to expend the income, which he estimated at about 15% a year, in maintaining additional almspeople in Foster's Almshouse. So recently as 1836 the rents do not appear to have exceeded 150%. In the hands of the Charity Trustees the profits increased by leaps and bounds, and have now reached upwards of 1,500% per annum, the whole being devoted to charitable and educational objects.

GENERAL.

The Architectural Profession will hear with regret that Mr. Alfred Waterhouse, R.A., is somewhat seriously indisposed at his country residence, Yattendon Court, near Newbury. By the latest account some improvement in his condition is happily apparent.

A Tablet has been erected by the Académie Française on the modest house in the village of Gargilliesse which from 1848 to 1876 was the residence of George Sand. It has been described by her in "Promenades autour d'un village."

M. de Madrazo, painter, has been made commander of the Legion of Honour. He is of Spanish origin, but for the last thirty years has lived in Paris.

Lady Algernon Gordon-Lennox (states the *Birmingham Gazette*) has made some interesting architectural discoveries at Broughton Castle, near Banbury. In removing the plaster from the walls of the great hall, five or six early fourteenth-century doorways have been revealed, which have been blocked up since 1554. Some very fine windows of the fourteenth-century period have also been disclosed, one of them still showing tracery.

The Parliamentary Vote for the British Museum, National Gallery, National Portrait Gallery, Wallace Collection and the universities and colleges of Great Britain, and the National Gallery and the Queen's Colleges, Ireland, &c., has amounted to 208,675%.

Mr. F. Bond, of Lincoln College, on Saturday lectured on "Architecture" at Oxford in connection with University Extension. Mr. E. L. S. Horsburgh dealt with "Early Italian Art."

M. Bartholdi has modelled a statue for the old "Maison des Fêtes," in Colmar, Alsace. The town, of which he is a native, already possesses memorials by the sculptor of General Rapp, Admiral Buat, Martin Schoen the painter, and other celebrities of Colmar.

Sir Charles Robinson, of Newton Manor, Swanage, has made the munificent offer to the Dorset County Museum of his complete collection of antique Roman glass. The glass was collected in Rome by him.

The Sanitary Institute will hold their next congress and exhibition in Manchester in the second week of September 1902, under the presidency of Earl Egerton of Tatton.

A New Bridge, spanning the Seine between the Louvre and the Mint, is to be constructed, in order to afford communication between a proposed extension of the Rue de Rennes and the Rue du Louvre.

Mr. W. Q. Orchardson, R.A., has been commissioned to paint the portrait of Sir John Leng, M.P., for the Art Gallery in Dundee. It is intended as a memorial of Sir John's public services to the city, which he has represented in Parliament since 1889.

The German Emperor has paid visits to Saalburg, near Homburg, formerly a Roman camp, where the architect, Herr Jacobi, is superintending the restoration of the old Roman fortress.

Mr. James Stirling, the Government geologist of Victoria, at present mining representative of Victoria in London, has been appointed to represent the Australasian Institute of Mining Engineers at the meetings of the International Engineering Congress to be held at Glasgow next month.

The Annual Congress on Literary and Artistic Property which was held at Vevey decided, as the result of a report on publishing contracts in artistic matters, to appoint a committee to draw up a model contract applicable to works of art, and especially engravings and sculptures. A report was presented by M. Mack, of Paris, on the suppression of false signatures, and the congress adopted a resolution declaring that special penalties should be provided in all codes dealing with frauds committed by the substitution or alteration of names or marks.

The Bill authorising the expenditure to secure the isolation of the National Gallery has been passed.

The Reparation Committee of South Bersted Church tower have issued a report to the effect that the underpinning and binding of the north buttress of the tower of the ancient church has been well carried out by Messrs. Booker Bros., in accordance with the directions of the architect, Mr. F. L. Pearson. The depth of the new foundation is 7 feet below the surface of the ground.

Leipzig is to have the largest railway station in Germany. The present existing six railway stations of that Saxon city, consisting of one Saxon, one Bavarian and three Prussian stations, are to be united into one huge central station into which all the various lines will in future run.

The Foundations of the Victoria and Albert Museum being completed—the contract was for 33,410%—a second contract has been made for building to the ground-floor level, and this work is now being proceeded with. As soon as this is finished tenders will at once be invited for the superstructure, the plans being now practically ready. No alterations have been made which would reduce the size of the museum, and no delays of importance have occurred, the work being completed within the allotted time. The contract for the foundations was not entered into until some time after the laying of the memorial-stone, that ceremony having taken place in advance to suit Her late Majesty's arrangements.

The Sanitary Institute will commence the course of lectures and demonstrations on September 2, and will continue until November 15.

A New Steel Bridge over the Tyne between Newcastle and Gateshead, which has been completed at a cost of 80,000%, was opened last Tuesday. The bridge has been built on the site of the one that existed there previously, and traffic has been carried on uninterruptedly during its construction. The new structure was built round about the old bridge, which was removed piecemeal. The engineers were Messrs. Sandeman & Moncrieff, Newcastle, and the contractors were Messrs. William Arrol & Co., of Glasgow.

Dr. Stein, of the Indian Education Department, has arrived in England from Chinese Turkestan. He has made many valuable archaeological finds dating back 1800 or 1900 years. It is probable that the greater portion of the collection will find its way to the British Museum, where Dr. Stein is at present engaged in the work of arranging them, while the remainder will go to the museums at Calcutta and Lahore.

THE Architect and Contract Reporter

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BLACKPOOL.—Sept. 16.—Competitive plans are invited for the laying-out of land to be added to the cemetery, with specifications, descriptions and estimates. Premiums of 30*l.*, 15*l.* and 5*l.* are offered. Mr. T. Loftos, town clerk, Town Hall, Blackpool.

CAMBERWELL.—Oct. 29.—Plans are invited for public baths and washhouses to be erected upon a site in the Old Kent Road. Premiums of 150, 75, and 50 guineas respectively are offered. The Town Clerk, Town Hall, Camberwell, S.E.

CHELSEA.—Oct. 1.—Competitive designs are invited for proposed new baths in King's Road, Chelsea. Premiums, 100 guineas, 50 guineas and 30 guineas respectively. Particulars at the office of the committee, 171 King's Road, Chelsea.

PENZANCE.—Sept. 1.—Competitive plans and estimates are invited for laying-out ground situate on the Western Promenade, to include a winter garden suitable for band and other concerts, and lavatory accommodation for ladies and gentlemen. Premiums of 21*l.* and 10*l.* 10*s.* respectively are offered for the best and second best designs. Mr. T. H. Cornish, town clerk, Public Buildings.

SHEFFIELD.—Aug. 31.—Sketch plans, sections and elevations, &c., are invited for the alteration of the Ecclesall Church, i.e. the removal of the galleries, the reseating of the nave and the building of chancel, &c. Accommodation required for about 800. The Rev. T. Houghton, Ecclesall Vicarage.

SHEFFIELD.—Sept. 30.—Designs are invited for a Memorial to Her late Majesty, Queen Victoria, on the site now occupied by the monolith in Fargate, such Memorial to include a statue of Her late Majesty. Prizes of 100*l.*, 50*l.* and 25*l.* respectively will be awarded to the three best of the unsuccessful competitors. Messrs. Wm. E. Clegg & George Franklin, honorary secretaries, Town Hall, Sheffield.

CONTRACTS OPEN.

ARGENTINE REPUBLIC.—December 10.—For construction of harbour works at Rosario. Particulars can be obtained at the Commercial Department Foreign Office, S.W., on personal application.

AUGHTON.—Aug. 22.—For erection of a new pavilion at the isolation hospital at Aughton, Lancashire. Messrs. William Rawcliffe & J. A. Seward, architects, Fishergate, Preston.

AYLESBURY.—Aug. 27.—For rebuilding of two culverts over the road, one situate near the post office, Ludgershall, and the other abutting on the County Council road in Ludgershall. Mr. W. J. Cook, surveyor, 69 High Street, Aylesbury.

BARNSELY.—Aug. 20.—For erection of a Primitive Methodist chapel and Sunday schools, &c., at Hoyland Common. Mr. Walter J. Sykes, architect, Hoyland, near Barnsley.

BATLEY.—Aug. 21.—For erection of buildings and chimney-shaft for the Corporation electricity works. Mr. J. H. Craik, town clerk, Batley.

BETHNAL GREEN.—Aug. 20.—For additions to a bake-house at 24 Calvert Avenue. Specifications, bills of quantities, form of tender and other particulars at the Architect's Department, Housing of the Working Classes Branch, London County Council, 18 Pall Mall East, S.W.

BIRKENHEAD.—Aug. 19.—For erection of engine-house, boiler-house, drying-shed, chimney and kiln at Moreton. Mr. George Howard, Moreton, near Birkenhead.

BIRKENHEAD.—Aug. 27.—For erection of a mortuary in Livingstone Street, Birkenhead. Mr. C. Brownridge, borough surveyor, Town Hall, Birkenhead.

BLACKBURN.—Aug. 22.—For erection of a chimney and buildings at Throstle Street. Mr. William Stubbs, Municipal Offices, Blackburn.

BLACKPOOL.—Aug. 19.—For fitting-up the proposed reference-room at the public library. Mr. John S. Brodie, borough surveyor, Town Hall, Blackpool.

BOSTON.—Sept. 3.—For erection of a cookery centre, pupil teachers' centre and evening science classrooms in Norfolk Street, Boston, Lincs. Mr. Jas. Rowell, architect, Market Place, Boston.

BRIDLINGTON.—Aug. 22.—For erection of a dwelling-house, two-storey stables and covered yard. Mr. J. Earnshaw, architect, Carlton House, Bridlington.

BRIMSCOMBE.—Aug. 19.—For erection of a mission-room at Hyde, Brimscombe, Gloucestershire. Mr. G. P. Milnes, architect, Town Hall Offices, Stroud.

BRISTOL.—Aug. 20.—For erection of a disinfecting station at Feeder Road, Bristol. Mr. T. H. Yabbicom, city engineer, 63 Queen Square, Bristol.

BRISTOL.—Aug. 22.—For erection of a coroner's court and mortuary, Quakers' Friars. Mr. T. H. Yabbicom, city engineer, 63 Queen Square, Bristol.

STURTEVANT

SYSTEM OF Warming & Ventilating.

STURTEVANT ENGINEERING COMPANY, LD.,

147 QUEEN VICTORIA STREET, LONDON.

GLASGOW, PARIS, BERLIN, STOCKHOLM, MILAN, AMSTERDAM,

DARFIELD.—Aug. 20.—For erection of four dwelling-houses at Darfield, Yorks. Plans, &c., may be seen at the Rising Sun inn, New Street, Darfield.

DARFIELD.—Aug. 21.—For erection of eighteen houses and a shop at Darfield, Yorks. Mr. A. B. Linford, architect, Carlton Villa, Wombwell.

DARLINGTON.—Aug. 22.—For erection of three model cottages and a reading-room on the Neasham Hall estate, near Darlington. Mr. G. Gordon Hoskins, architect, Darlington.

ENFIELD.—Sept. 3.—For erection of a junior mixed school at Chesterfield Road, Enfield Lock. Mr. G. E. T. Laurence, architect, 22 Buckingham Street, Adelphi, W.C.

GOOLE.—Aug. 28.—For erection of porches and other works at the schools, Swinefleet. Mr. F. Chambers, architect, Clifton Gardens, Goole.

HALIFAX.—Aug. 19.—For erection of several blocks of conveniences, outbuildings, &c., at Holywell Green, near Halifax. Mr. W. Clement Williams, architect, 29 Southgate, Halifax.

HOVE.—Aug. 26.—For construction of laboratory and alterations to the town clerk's, rates and sanitary offices at the town hall. Mr. H. H. Scott, surveyor, Town Hall, Hove.

HULL.—Aug. 19.—For erection of a warehouse at the Waterloo Mills, Cleveland Street. Messrs. Wellsted & Easton, architects, Prince's Dock Chambers, Hull.

HUNSTANTON.—Aug. 21.—For erection of a purifying-house and other buildings at the gasworks. Mr. J. S. B. Glasier, clerk to District Council, Hunstanton.

ILFORD.—Aug. 26.—For erection of a 34-bed ward, discharging block, additions to administrative block, two cottages, boiler-house, stable and addition to laundry, at the isolation hospital. Mr. Herbert Shaw, 7 Cranbrook Road, Ilford.

IRELAND.—Aug. 19.—For erection of a tankhouse at the electric-power station, Sutton; and a fitting-shop and a sand-drying store, in connection with the electric-car shed at Sutton, Dublin, for the Great Northern Railway Company (Ireland). Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

IRELAND.—Aug. 20.—For repairs to the old abbey church, Bangor. Mr. Henry Seaver, architect, Royal Avenue, Belfast.

IRELAND.—Aug. 20.—For the formation of an avenue between Malone Road and Lisburn Road. Mr. Henry Seaver, 128 Royal Avenue, Belfast.

IRELAND.—Aug. 21.—For erection of schools for the Sisters of Mercy, Cappoquin, co. Waterford. Mr. Samuel F. Hynes, architect, 21 South Mall, Cork.

IRELAND.—Aug. 26.—For erection of a lecture hall at Stewartstown, co. Tyrone, adjoining Presbyterian church. Mr. Henry Hobart, architect, Dromore, co. Down.

IRELAND.—Aug. 31.—For erection of a rectory at Belmullet, co. Mayo. Mr. Joseph S. Cairns, architect, Dillon Terrace, Ballina.

IRELAND.—Sept. 3.—For erection of a coastguard station at Knightstown, county Kerry. Plans, &c., can be seen at the Office of Public Works, Dublin.

KENDAL.—For alterations and additions to Romney House, altering Romney House and converting back buildings, stables, coach-house, &c., into two cottages. Mr. John Hutton, M.S.I., architect, Kendal.

LEAVESDEN.—Aug. 28.—For certain alterations and additions to the laundry at the Leavesden Asylum, near Watford, Herts. Messrs. Newman & Newman, architects, 31 Tooley Street, London Bridge, S.E.

LEEDS.—Sept. 4.—For erection of twenty-nine blocks of buildings and the alteration of several others, with roads, drains and all fittings forming the extension of the City Hospital, Seacroft. Mr. Edwin T. Hall, architect, 54 Bedford Square, W.C.

LONDON.—Aug. 28.—For erection of an external staircase, composed of granolithic concrete, with iron and concrete enclosure, wooden roof, &c., from the ground to the first floor of one of the buildings at the workhouse in the Fulham Road, S.W. Mr. Edwin T. Hall, 54 Bedford Square, W.C.

LONGTON.—Aug. 22.—For alterations and additions to the Queensberry Road school, Longton. Mr. J. H. Beckett, architect, Stafford Street, Longton.

LUTON.—Aug. 23.—For erection of fire-station and other buildings in Church Street and St. Mary's Road. Mr. Geo. Sell, town clerk, Town Hall, Luton.

MARKET WEIGHTON.—Aug. 24.—For erection of a chapel at Market Weighton, Yorks. Mr. W. G. Smithson, architect, 13 Bond Street, Leeds.

MIDDLESBROUGH.—Sept. 2.—For extensions of the borough asylum. Mr. A. J. Wood, architect, 22 Surrey Street, Victoria Embankment, W.C.

ANCIENT PERUVIAN SEPULCHRAL POTTERY.

THERE will shortly be dispersed under the hammer of the auctioneer one of the most interesting collections of ancient pottery ever got together, these consisting of over 400 pieces of ancient Peruvian pottery, collected by Sir Spenser St. John, Her late Majesty's former Minister at Lima. Every piece is different, and have been unearthed in all parts of the Peruvian continent, one piece, a tigress with her cubs, having come from the Temple of the Sun at Trujillo. Another specimen is supposed to represent the Buddhist Trinity, though how the doctrines of Buddha got into South America requires some explaining. Other specimens represent animals, fish and fruit, and the human form, some being represented as in a diseased and deformed condition. The collection is absolutely unique, and it is the first occasion that such a representative lot of ancient sepulchral pottery from Peru has been offered to the public. Mr. Stevens, of Covent Garden, will offer them about the end of September.

TRADE NOTES.

THE heating of the new fire station, Blackpool, is being carried out by Mr. W. F. Spencer, Cross Bank Works, Oldham, and 145 Queen Victoria Street, E.C.

MESSRS. GEO. JACKSON & SONS, of 49 Rathbone Place, W., have been appointed decorators in relief to His Majesty the King. Messrs. Geo. Jackson & Sons have had Royal warrants granted to them by the three previous sovereigns—George IV., William IV. and Queen Victoria.

In the south-east corner of the Ambulatory of the Royal Exchange a panel is being prepared for the reception of the work of Mr. Edwin A. Abbey, R.A., on the commission from the Skinners' and Merchant Taylors' Companies, to commemorate the founding of their annual feast. In the reign of Richard III. there occurred a dispute between the companies as to which should take precedence of the other at civic functions. Lord Mayor Billesden (1483) decreed that they should enjoy precedence in alternate years, and should dine together, in token of amity, on the eve of St. John's Day, June 24.

BUILDING AND BUILDERS.

THE corner-stone of a new chancel to Westwood Edge Church, Golcar, was laid on the 3rd inst.

AN apprentice slater named John Clark, eighteen years of age, fell from a scaffolding in Shaw Street, Greenock, N.B. He fell nearly 40 feet, and was so badly injured that he died while being conveyed to the infirmary.

THE London and North-Western Railway Company, which is just completing extensive improvements and alterations at Lancaster station, costing nearly 60,000*l.*, is about to construct a new goods station in Ashton Road, Lancaster, at a further cost of 40,000*l.*, on the site of the old passenger station.

THE Lincoln City Council have passed plans for a new Congregational church in the High Street (St. Botolph's), for alterations and additions to the Church House, a temporary church mission room in Long Leys Lane, six houses on Newark Road, a house and shop in Scorer Street, a house off Saxilby Road, an office in the High Street, and for additions to the Horse and Groom public-house and to the Ripon Arms.

THE new post office at Kirkcaldy, N.B., is now well advanced, and a commencement has been made to the large new police buildings. In various parts of the town new houses, chiefly cottages and tenements, are being erected, while plans have just passed the Dean of Guild Court for a new hotel of large dimensions in the vicinity of the railway station. The building trade in this town, which is fairly busy at present, is expected to be very active in the immediate future.

THE great works in connection with the Dublin main drainage at Burgh Quay, at the corner of Townsend and Brunswick Streets, and at the junction of Tara and Townsend Streets, are making fair progress, considering the heaviness of the operations. At Burgh Quay excavations to the depth of 56 feet, which is a considerable distance below the bed of the river, have been made, and at the other points mentioned deep excavations are being proceeded with by the workmen engaged by the contractors, who will require a considerable further time to complete these portions of their contract.

THE sub-property (city buildings) committee of the Leeds Corporation are considering the question of providing new law courts for the town. Councillor Beaumont, the chairman of the committee, brought forward in October last a report upon the inadequacy of the existing accommodation at the courts provided in the Town Hall, and the arrangements made with

regard to accommodation in other towns visited by a deputation appointed for the purpose. The report was submitted at the Council meeting held on December 5, when Alderman Gordon proposed an amendment that was ultimately adopted, accepting the report.

THE corporate property committee of the Scarborough Corporation, at a meeting on the 6th inst., discussed the question of the conversion of St. Nicholas House into new municipal buildings. The new town hall estate sub-committee, having opened the tenders for the alterations and additions to St. Nicholas House, now recommended the property committee to accept them, and the tenders having been sealed it was resolved, after considerable and animated discussion, to recommend that the work be at once commenced. The total amount of the tenders sealed was 16,209*l.*

THE contractors for the Scarborough Marine Drive, whose time for the completion of the contracts, it is stated, has expired, have written to the Marine Drive sub-committee denying the accuracy of the resident engineer's figures, and contending that the extra time allowed for stress of weather, &c., has not expired. They also question the right of the Corporation to make deductions owing to the contract not being completed. In addition, they state that they are of opinion that the suspension of their certificates is contrary to the conditions of the contract.

THE foundation-stones were laid on the 11th inst. of a new Roman Catholic church at Latchford, Warrington. The cost of the new church, which will have accommodation for 600 people, will be about 6,000*l.* It will be of transitional Gothic design, built of Yorkshire stone with red stone dressings. The length of the interior will be 124 feet and the width 48 feet, and the total height, including tower and spire, will be 130 feet. There will be a nave and two aisles, with six granite columns on each side of the nave, resting on a Yorkshire stone base, a large sanctuary, with altar, two side chapels and vestries. The organ gallery and choir accommodation will be over the main entrance, which will be from St. Mary's Street.

THE Town Council of the City of York having applied to the Local Government Board for sanction to borrow 2,845*l.* for the purchase of land for the purposes of street improvement, and also for approval of the borrowing of 1,465*l.* for the purchase of land situate in the parish of Water Fulford, in the East Riding, for purposes of a lunatic asylum, a Local Government Board inquiry into the subject-matter of the applications

was held on Tuesday in the Guildhall by Colonel A. J. Hepper, D.S.O., R.E., Local Government Board inspector. There was no opposition and the proceedings were very brief. At the conclusion of the inquiry the inspector viewed the property and land involved in the applications.

AFTER inspection of crematoria at Manchester, Liverpool, Hull and elsewhere, the sanitary committee of the City's Public Health Department recommend that the Corporation should erect at the cemetery at Ilford a crematorium at a cost of 10,500/. It is proposed that the tower of the structure be 80 feet high. The committee record that they are strongly of opinion that if this mode of sepulture is to be made popular, buildings should be erected of a character that will permit of cremation being carried out in good surroundings, and in a manner which will recommend itself to the most sensitive. The columbarium under the crypt will be fitted up for the reception of urns, and various monuments can be attached to the walls or niches.

IT is announced that Colonel Hay, who recently succeeded to the estate of Inverpeffray, a few miles to the east of Crieff, is about to have the ruins of the ancient castle of Inverpeffray restored. The castle is situated on the north bank of the river Earn, and within a very short distance of the ancient church and library of Inverpeffray. The castle was built in the sixteenth century by James Drummond, first Lord Madderty, whose family is now represented by Viscount Strathallan. One of the Lords Madderty was educated along with James I., and was esteemed by that monarch "a man of parts and learning," and became a special favourite of the Court. The castle, like many other buildings at that distant period, was designed for a place of defence as well as a dwelling. The ground floor was mostly arched, with small windows, as they might be used for shooting out arrows or balls. Like many other old buildings it had been mostly finished with oak, but a former Earl of Kinnoull, who was then the proprietor, is said to have ordered the best of the woodwork to be taken to erect offices at Dupplin Castle. The castle has been in ruins, it is said, for from 150 to 200 years, but the walls appear still to be in a fair state of preservation, although partly overgrown with vegetation. The remains of a once noble avenue of trees leading to the castle are still extant, and the whole had been enclosed by a wall and gateway fronting the north. The plans for the restoration are now, it is stated, in the hands of Mr. George T. Ewing, architect, Muthill.

MR. R. H. BICKNELL, Local Government inspector, held an inquiry at Oldbury respecting the application of the District Council for sanction to borrow the sum of 18,150/ for works of sewerage and sewage disposal. Mr. Shakespeare (clerk) explained that the sewers in the town were laid between 1879 and 1888, the bulk of them being laid between the former date and 1883, at a total cost of 37,313/. In April 1899 complaints were made by the county medical officer and other persons of the nuisance arising from the sewers, and in consequence the Council instructed Mr. Shipton, their surveyor, to prepare a report upon them. This he did, and he suggested the reconstruction of the sewers and certain alterations being made. The Council considered that report so serious that they decided to consult Mr. Eayrs, a sewerage engineer, who had considerable experience in that work, and he prepared a report which confirmed the decision arrived at by Mr. Shipton. Acting on the instructions of the Council, Mr. Eayrs prepared a scheme for the reconstruction of the defective sewers, which the Council decided to adopt. The scheme provided for their reconstruction, and it was hoped that this would render the system sufficient to last the district for the next thirty years. The cost of the work was 18,150/. Mr. J. T. Eayrs detailed the scheme, and said the reconstruction of the sewers was necessary mainly owing to damage caused by mining operations, and also that they were badly constructed at first. It was also proposed to enlarge a number of the existing sewers. Evidence was also given by Mr. Shipton, and at the close of the inquiry the Inspector said he would report to the Local Government Board.

ELECTRIC NOTES.

IT appears that in the municipal accounts of Bradford for the last financial year the most paying item is municipal lighting. The gas and electricity are responsible for a profit of 59,000/ on an expenditure of 210,000/. In Manchester the corresponding profit is nearly 52,000/.

COWDENBEATH, in Fifeshire, is to have the streets all lighted by electricity. A steam-engine and dynamo are to be placed at a colliery adjoining the town, and the current distributed from there to about 320 electric incandescent lamps erected on the gas-lamp pillars. The contract has been placed with Messrs. Hunter & Jack, Glasgow, who three years ago successfully lighted Hill of Beath in the same way. The new light is to be running by the end of September.

Vol. LXV. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered. Price 12s. 6d. Office: Imperial Buildings, Ludgate Circus, E.C.

THE recent opening of the electric line from Fayet St. Gervais to Chamounix inaugurates a new era for this famous Alpine resort, and it is probable it will in a very short time render Chamounix as popular a tourist centre as Interlaken or Zermatt. The new line passes through some very fine scenery, and crosses the gorge of the Arve by the imposing viaduct of Ste Marie, consisting of eight arches, 165 feet above the torrent. It also brings Chamounix within four hours of Geneva, fourteen hours of Paris, and twenty-one hours of London, and it is expected that the line will be continued to Martigny, there joining the great Simplon route to the Italian lakes and Milan, thus placing Chamounix on one of the great highways between France and Italy.

PELLON LANE Baptist chapel, Halifax, is closed for repairs and the installation of electric lighting on a very complete scale. The latter work has been entrusted to Mr. W. Parker, Highfield Place, who carried out similar work at Square and Stannary churches. Depending from the ceiling there will be six three-light electroliers, and three three-light brackets will be fixed from the woodwork of the gallery, one from each side and one from the back. There will be a couple of lights for the organist and four for the choir, which will be fixed on an electrolier at the top of each of the pitch-pine pillars. Underneath the gallery thirteen lights will be installed, making a total for the interior of the church of forty-six lights. In the vestibule there will be a two-light fitting and a single fitting in each staircase leading to the gallery. One light will also be fixed outside the door. The whole of the lights will be controlled by a double-pole distributing board, with fourteen switches, fixed in the vestibule.

THE British vice-consul at Kragero, Norway, reports that there are several large waterfalls about ten to twelve miles from that town, and a company, with a share capital of about 35,000*l.*, has been recently registered for the purpose of working them. The town is to be lighted by electricity, and it is to be hoped that factories, workshops and other establishments with power driven by electricity will be built in the town and neighbourhood. The company is also building a large dam in order to regulate the river, which brings all the timber from the country down to Kragero. As the waterfalls will develop very great power, which will be let out at a low price, and as wages and ground are cheap, it seems probable that money could be invested to good advantage in building factories, &c., in the vicinity of the power stations. It is also probable that this company will supply the power for the

contemplated railway. The British vice-consul at Flekkefjord reports to the Foreign Office that electrical works are being built on account of that town. The power (about 1,000 horse-power) is taken from a waterfall situated about eleven kilometres (seven miles) from the town. The light is paid for at a rate of 10*s.* per 16 normal-light lamp. For manufacturing use it is paid for at a rate of 2*l.* 15*s.* to 3*l.* 18*s.* per horse-power per year, the rate being cheaper the more power required. The rate works out much cheaper than the use of steam.

AT a meeting of the Cardiff electrical committee—Councillor Hallett presiding—particulars were furnished by Mr. Ellis, the electrical engineer, of the business conducted by the department in July. The works cost for the month was 1710*d.* per Board of Trade unit, and the total cost, including management, but excluding interest and repayment charges, 2½*d.* per unit. The Chairman asked if they had actually turned the corner, or were they simply "turning the corner" still. Mr. Ellis: We are actually making money after paying working expenses. Councillor Good asked what dividend they were making on their capital of 106,000*l.* Councillor Iltyd Thomas replied that they were making nearly 6 per cent., but of course they had to pay interest and to provide for redemption of capital. Mr. Ellis said that if they were a private company they would be paying a dividend at the rate of 5½ per cent. per annum, as private companies were not compelled to provide for repayment within the number of years prescribed for public bodies. Councillor Good said he wanted to know the actual profit, after all payments had been made. Mr. Ellis replied that last year it amounted to 22*l.* Councillor Brain: In 18 years we shall have completed all our interest and sinking fund charges. A special circular was submitted by the electrical engineer showing the material reductions made in the cost of charges for electrical energy for lighting, heating and power purposes, which he recommended should be sent to all residents on the route of the mains, and also advertised in the Cardiff newspapers. The recommendation was adopted.

THE Corporation of Newcastle-under-Lyme two years ago obtained a provisional order authorising the institution of electric supply works for purposes of lighting and power, and the Corporation recently applied for an extension of time for another year. Messrs. Lacey, Clirehugh & Sillar, consulting engineers, have presented a report to the electric supply committee. The engineers claim that their estimates demonstrate that even with a small demand it is commercially possible to establish works on a remunerative basis at Newcastle. They

FISHBURN'S LABOUR SAVING WINCHES.

To Builders and Contractors, Masons, Fireproof Building Constructors, Excavators, Plumbers, Manufacturers, Merchants, and others.

This Machine will be found invaluable in Warehouses, Factories, Maltings, &c., for lifting or lowering by hand-power goods in bulk. Also Barley, Wheat, Flour, Cement, &c., in sacks. It can be placed in the basement, intermediate, or top floor, to work entirely or partly inside the building. By a simple and expeditious arrangement it can be made to lift or lower at two or more points (or hatchways) to suit the floor spaces.

By its use in building operations ordinary Wheelbarrows, Handbarrows, Baskets, Buckets, or other receptacle being used, the loaded one ascends while the empty one descends, and rendering unnecessary the dangerous practice of carrying loads up ladders. Prepared Stonework, Bricks and Ornamental Work, can be dealt with without risk of damage. Also material for Carpenters, Plumbers, &c.

The Machine is so named because of its adaptability as a means of lifting or lowering articles and materials of every kind with great despatch and Safety.

CATALOGUE ON APPLICATION.

recommend the low-tension system, and that the best method would be to generate the electricity at a pressure of from 440 to 480 volts, and distribute it by means of the three-wire system so that a consumer requiring a supply for lighting would receive 220 volts, and for power purposes 440 volts. This system would permit of a storage battery, and was perfectly safe to handle. For so small a demand the engineers consider that gas-engines would prove the most economical, but that when the demand increases considerably steam would be the most satisfactory. The estimates include mains along all the principal streets, designed so as to be extended in any direction. In the estimate of receipts the price of electricity is taken at 6d. per unit, which is said to be equivalent to 3s. 6d. per 1,000 feet gas. The estimate of capital expenditure using steam is 10,389l., and using gas 8,365l. The working is estimated to cost (including interest and sinking fund) with steam 1,487l., and with gas 1,381l. The revenue is estimated at 1,500l. The report is under the consideration of the committee.

VARIETIES.

THE new Primitive Methodist Sunday schools erected in Middlemore Road, Smethwick, were opened on Wednesday. The building, which will accommodate over 300 persons, has been erected at a cost of 950l.

SIR HORATIO LLOYD, one of the hon. secretaries of the committee which is carrying out the restoration of the south transept of Chester Cathedral as a memorial to the late Duke of Westminster, announces that the total cost will be 9,720l., and of this 8,718l. has been subscribed.

MR. ALEXANDER LAING, hotel proprietor, of Newcastle-on-Tyne, has commemorated his fiftieth year of commercial life in that city by the presentation to its inhabitants of an art gallery which will cost 20,000l., irrespective of the site, which was given by the Corporation.

A NEW voluntary school was on Tuesday opened at Whitehaven, Cumberland, by the Bishop of Carlisle. The school, which has cost 5,500l., is the gift of Miss Crosthwaite, of Whitehaven, and is in addition to other school accommodation, costing another 5,000l., raised by public subscription.

THE new St. Gerardine Church at Lossiemouth, N.B., erected in connection with the Established Church of Drainie,

was opened on the 10th inst. It has been erected on the Coulard Hill, overlooking the Moray Firth, from plans by Mr. Burnett, architect, Glasgow. Accommodation is provided for over 500 worshippers, and the total cost is about 4,000l.

THE damage caused by the recent fire at the Birkenhead Town Hall has been assessed at over 15,000l. The tower, with the clock and the cupola, the beautiful and valuable stained-glass roof over the Council chamber, the Council ante-room and the roof of the main building will, it is understood, be repaired and rebuilt to its former condition, and this cannot be done for less than the amount named.

THE harbour extension works which have been in progress since 1897 at Burntisland, N.B., may now be said to be completed. After some experiments with the dock gates these were opened on the 10th inst to admit a small vessel belonging to the dock contractor, Sir John Jackson, who is removing his surplus plant to Sunderland, where he has another large contract. Fully 28 feet of water covers the dock area, and the loading hoists and engine power are in a condition for immediate traffic.

THE parish church at Stoke Bruerne has been reopened after renovation, and a new baptistery dedicated. The restoration consists principally of the removal of the comparatively modern plaster which had begun to peel off, repairs to the interior of the walls, the painting of the walls, repairs to the internal stonework of the church and various minor improvements. The work has been performed under the supervision of Mr. Matthew H. Holding.

THE Commissioners of Northern Lighthouses have given notice that on and after October 1 next a light will be exhibited from a new lighthouse erected on East Barnsness, near Dunbar, in the Firth of Forth. The light, which is of 78,000 candle-power, will be group flashing, white, showing three flashes in quick succession every 30 seconds, and will in clear weather be visible about seventeen nautical miles.

OWING to the sinking of woodwork at the entrance to one of the tunnels on the Albula railway line (Switzerland), which is in course of construction, part of the structure collapsed. Fourteen workmen were entombed. The work of rescuing the men, which was immediately begun, has so far resulted in the recovery of four bodies. One man, severely injured, has been extricated. An engineer engaged in the rescue work was carried away by the falling earth and killed.

And every available example of Celtic Art.

The wonderful durability of IRISH LIMESTONE
well-known.

WISTOW parish church, near Selby, Yorks, which has been refloored and reseated, as well as having had other improvements made to it during the past few months, necessitating an expenditure of considerably over 600*l.*, was reopened on the 31st ult. The improvements effected include concreting floor of nave and aisles, reseating in plain oak and reflooring of the sacrum, and the addition of a new font and cover.

THE record for large water borings, which has hitherto been held by Gainsborough (Lincolnshire) is about to be challenged by Lincoln itself. The Corporation of that city recently invited tenders for a boring 2,176 feet deep, lined with 30-inch tubes, for a depth of 400 feet, and terminating not less than 12 inches in diameter. Seven tenders were received for the work, and the Corporation, on the advice of the engineer, Mr. Percy Griffith, of Westminster, have accepted that of Messrs. Charles Chapman & Sons, Ltd., of Salford, amounting to 14,605*l.* The time allowed for the completion of the work is four years, but it is anticipated that a shorter period will suffice.

At a meeting of the Coatbridge Town Council, Provost M'Cosh presiding, the question of the free public library, for which Mr. Carnegie has offered 15,000*l.* was discussed on a minute of committee recommending the adoption of the Act, and that a number of baths and swimming pond should be erected on the same site, at a cost for both sets of buildings of about 18,000*l.* The committee recommended that competitive plans should be got for the erection of the buildings, and that it should be remitted to them, with full powers to purchase the best available site. Several members, however, considered that the baths should be a separate venture, and that a site for the library should be secured first. Eventually it was agreed to defer adoption of the minute till the committee have further reported as to site and cost, and Councillor Orr formally gave notice that he would move the adoption of the Free Libraries Act at next meeting.

THE following curious incident is reported from America:—Two men owned properties, one on each side of the St. Lawrence. A flood arose and washed away the wooden house of the man who lived on the Canadian side. For some days he believed it lost till he learned that it had "fetched up" on the land of the gentleman whose property lay on the American bank. He went over and claimed it, but the American refused to give it up on the ground that anything washed up on to his shore became his own property if unclaimed within two days. But the disappointed Canadian had

his revenge. He reported the American to the Customs for smuggling a house, and the latter had to pay duty and a large fine.

A NEW hotel has been erected on a spur of the Longmynd, Church Stretton, 800 feet above the sea level. The building is situated in the midst of over 10 acres of beautifully wooded grounds, which slope down to the main road leading from Shrewsbury to Hereford, and is within easy distance of the railway station. It has a southern air-space, and commands a fine view of the valley and the Caradoc, Hazler and Ragleth hills, which can be viewed from a broad terrace which runs along three sides of the structure. The hotel is four storeys high, and contains on the ground floor entrance hall and lounge, staircase, hall and lift, dining-room 40 feet by 18 feet, drawing-room 28 feet by 18 feet (the two latter rooms opening on to the terrace, which forms a pleasant lounge and parade), billiard-room 25 feet by 18 feet, recreation-room 42 feet by 18 feet, and Turkish baths and dressing and cooling rooms. On the first floor there are seventeen bed and sitting-rooms, four bathrooms, &c., on the second floor eighteen bedrooms, bath, &c., and on the third floor ten bedrooms. The offices, which are large and well arranged, comprise all necessary conveniences, and the water supply is obtained from the springs in the hills. The building is heated throughout with hot water and will be fitted with the electric light.

THE Lichfield Cathedral library, which was closed for some months, has now been reopened. The library was originally closed because the Dean and Chapter, in their desire to place the fabric of the cathedral as nearly as possible into its original condition, decided to renew the roof of one of the rooms which lie above the entrance to the chapter-house. On that room the central spire fell at the time of the siege, breaking it almost to pieces, and at the very extensive reparation under Bishop Hacket, probably from want of funds, a plain plaster ceiling was substituted for the original groined roof. Enough, however, of the groining was left to show what the roof had been, and it has now been replaced in its original form—a thoroughly good and handsome piece of work. It was not, however, the reparation of the roof alone which kept the library so long closed. The western wall of the room was found to be nearly one foot out of the perpendicular, and had to be reconstructed from the foundation. The work, however, is now completed, and the shelves and books are all replaced.

SUB-AGENTS OR TRAVELLERS REQUIRED THROUGHOUT THE UNITED KINGDOM.

Greenfield, was formally opened on Monday last. The site chosen for the new school is an excellent one, having frontages to three streets, and the building forms an imposing two-storeyed structure of red Dumfriesshire stone, and provides on two floors accommodation for 1,000 scholars. Separate entrances for boys, girls and infants lead into a large and well-lighted and ventilated central hall, which is to be used for drill purposes. On the upper floor a balcony runs round the central hall, protected by a high iron railing. The classrooms, sixteen in number, enter from the central hall on the ground floor and from the balcony on the upper floor. Every two classrooms are divided by sliding glass partitions, so as to be converted into one for a collective lesson. The buildings are heated and ventilated by mechanical means. The fresh or heated air is forced into the building by means of a powerful fan driven by a gas-engine. The school is finished throughout in a simple yet tasteful manner, and is a successful example of modern school planning. At the rear of the site there is placed a house for the caretaker. The total estimated cost is 12,000*l*. The architect is Mr. Alexander Cullen, Brandon Chambers, Hamilton.

GAS STOVES AT THE GLASGOW EXHIBITION.

MESSRS. S. CLARK & CO., of Park Street, N., have an attractive stand at the exhibition at Glasgow, where they are showing a representative assortment of their patent syphon stoves, the principle and design of which are well known to our readers. Here, however, they may be seen in a variety of finish—japan, enamels of different colours, and plating, and a combination of enamel and plating, which produces a striking and eminently pleasing effect. The "Empress" stove finished in this way, with nickel-plated columns, Corinthian capitals and body in ceramic enamel of art blue, is distinctly handsome and attractive, and is suitable for the warming of large rooms, galleries, studios, halls, &c.

The "Syphonette" series is a handsome range of stoves, very bright and cheerful looking and artistically finished in ceramic enamel with a coloured-glass screen in front.

The "Cabinet" is a handsome cased stove with two burners. The panels are of open ironwork, permitting the light to shine through. The top may be used for keeping dishes warm. It is so constructed that one or both burners may be used as desired.

Another excellent stove which may be seen at this stand and one which we believe has not been exhibited before, is the

new cooking stove with patent grill, which Messrs. Clark & Co. recommend with confidence. In addition to those mentioned, there are several other stoves which burn gas, and a distinct series which are adapted for the consumption of oil. In this series the leading designs are reproduced. They are, therefore, just as effective as the gas stoves, are very economical, and, which enhances their value in many cases, they are portable.

SKETCHES AROUND WARWICKSHIRE.

A SAFE FOR ARCHITECTS.

WE lately referred to the need which exists for a proper provision in the fitting-up of architects' offices for the safeguarding against destruction by fire or otherwise of important and valuable plans and drawings. We are glad to receive a description of a new and patent safe which has just been brought out by Messrs. Chubb & Son's Lock and Safe Company, Ltd., of Queen Victoria Street.

This safe, the measurements of which are, outside, 4 feet 4 inches high by 4 feet 4 inches wide by 3 feet 4 inches deep; inside, 3 feet 6 inches high by 3 feet 6 inches wide by 2 feet 4½ in. deep, is fitted internally with fourteen light steel sliding trays, the fronts of which are shaped for readily pulling out and for lifting edges of sheets to sort and select. Each tray is numbered to correspond with the card-cases for clients' names or indices on the right-hand door. The safe is of the best fire-resisting quality, being extra thick all over, and is packed with mineral non-conductors and steam-generating salts. The latter only give off their water of crystallisation when subjected to the heat of a fire, thus serving to protect the contents from dry baking. In the design of this safe special precautions have been taken to give the doors a secure seating when shut. This is effected by forming them with projecting tongues all round their edges, and corresponding sunken grooves on the safe. In addition to these, the doors both carry Chubb's patent spring plates, which act like a separate pair of cupboard doors, and form an extra intermediate air space. The value of extra inner doors is well known as an additional precaution in a safe against fire and heat. Chubb's patent spring plates confer all their advantages without their inconvenience. Where expensive and valuable standard drawings have to be kept in absolute

security for reference, the price paid for a safe of this kind as compared with the cost of the usual combustible wooden nest will be more than recouped by the purchaser in the freedom from anxiety which it confers. The price of this safe ranges from 75*l.* upwards, according to quality.

QUEENSLAND FOREST TREES.

AS may be inferred, Queensland, lying within two zones (10 degrees to 29 degrees south), and with over 2,500 miles of coast, possesses a remarkably rich and varied flora. The dense scrubs frequently bordering the rivers contain trees which supply valuable timber, whose stems are often clothed with superb climbers, and the undergrowth is intermixed with ferns exceedingly beautiful and of almost endless variety. The more open or forest country and the downs are covered with rich and nutritious grasses and other fodder plants. Few plants are to be met with of a poisonous or deleterious character, while many are extremely beneficial to man. From some drugs that are in use both in Europe and Australia have been prepared; the barks of many are used advantageously in dyeing and tanning, and from the leaves of others oil of a highly fragrant nature has been obtained. Though there are many beautiful cabinet woods, and woods of great value for railway sleepers and all uses in which endurance is required, still only a very few of the timber trees are at present cut for use, and these are a mixed lot sold under the names of "hard" and "soft" woods. The hard woods are principally supplied by the Eucalypts, and denominated ironbark, gum, box, peppermint, stringybark and turpentine. The soft woods are almost entirely derived from the various pines. Hard woods are generally obtained in open or forest country, soft woods in the scrub lands on the borders of rivers and the rich moist lands often met with on the tops of the ranges; yet this rich scrub soil often produces some of the very best hard woods—as, for instance, the Johnstone River hard wood, which is considered second to no timber in Australia for strength and durability; also Thozet's Box, one of the most valuable Eucalypts found in the scrubs bordering the Fitzroy.

Amongst the hardwoods, where strength and durability are required, those known as ironbark take first rank. Of these there are several kinds, the best being obtained from Eucalyptus siderophloia, of which there are two kinds of wood, one red

and the other a brownish-grey, both excellent timbers, though the red is the favourite; *E. crebra*, or the narrow-leaved iron-bark, which has a greyish wood, very strong and durable, and the Palmer River ironbark, better known by the lemon-like fragrance of its leaves, from which it received its local name, than as a timber. The wood of this last, though very hard and of a rich red colour, is usually small and pipy.

The trees known as stringybarks supply excellent timber for sawing and splitting; the kinds cut under this name are usually *Eucalyptus acmenioides* and *E. eugenioides*. Nearly resembling these in bark are the trees sometimes called turpentine (*E. microcorys*)—a very hard, strong, durable timber; *E. baileyana* and *E. resinifera*, two excellent timbers with a fibrous bark, from which circumstance they are at times known as stringybarks.

The timber generally known as gum is furnished by those *Eucalypts* which annually shed their barks, as the blue gum (*E. tereticornis*), the poplar gum (*E. platyphylla*), the grey gum (*E. saligna*), the spotted gum (*E. maculata*), the woollybutt (*E. botryoides*) and the Moreton Bay ash (*E. tessellaris*). The bark of the last two is persistent at the base. There are also several others called gum trees, but those noticed furnish the best timber. The so called box is a name under which several trees supplying good useful timber are known, as poplar box (*E. populifolia*), gum-topped box (*E. hemiphloia*), Thozet's box (*E. Raveretiana*) and also the Brisbane box (*Tristania conferta*).

Two trees are designated bloodwood. The common bloodwood (*E. corymbosa*) is only adapted for using whole, as it often contains cavities in the wood so full of gum as to render it useless for sawing; it is, however, the favourite timber, on account of its durable nature, for house-stumps, piles for bridges and other works where it can be used uncut. The white bloodwood (*E. trachyphloia*) is very similar, but the wood is of a lighter colour and not quite so durable.

The hardwood of the Johnstone River is furnished by a species of *Backhousia*, *B. Bancroftii*. This is a very tall erect tree, and so far as is yet known the wood is both durable and strong, does not crack or warp, and is easy to work. The broad-leaved or paper-barked tea-tree (*Melaleuca leucadendron*), the mahogany—Tom Russell's Mahogany, as it is sometimes called—(*Lycarpus ternifolius*), and the swamp mahoganies (*Eucalyptus robusta* and *Tristania suaveolens*) are timbers of a high quality, though the last-mentioned is useless except under water, when it is extremely durable.

The hardest wood, however, of Australia is that of *Erythrophloeum Laboucherii*, a tree met with in North Queensland, from the Endeavour River to Normanton. The wood of this tree is a rich red in colour, and takes a high polish.

The soft woods in use are the Bunya (*Araucaria Bidwillii*); Moreton Bay or Hoop pine (*Araucaria Cunninghamii*); Dundathu pine (*Agathis-Dammara-robusta*); the She-pine (*Podocarpus elata*), and several of the *Callitris* under the name of cypress pine.

For cabinet and ornamental purposes the following are in high request:—Red cedar (*Cedrela Toona*)—the Moulmein cedar of the English market; yellow wood (*Flindersia Oxleyana*), and others of this genus, especially *F. australis*; silky oak (*Grevillea robusta*); deep yellow wood (*Rhus rhodanthema*); tulip wood (*Harpullia pendula*), and beech (*Gmelina Leichhardtii*), a tree attaining a great size. The wood of this last is in great request for verandah flooring and deck planking.

Other woods suitable for cabinetwork are *Elæocarpus Bancroftii*, a tree with a firm light sapwood and a quantity of very hard, prettily marked heartwood, though perhaps its true value will be in its proving a substitute for the American *lignum-vitæ* in the manufacture of blocks, pulleys, &c., than as a cabinet wood; several of the *Evodias*, all having a white pliable wood; the satinwood (*Zanthoxylum brachyacanthum*), one of the most beautiful yellow woods known; *Geijera Muellieri*, a common tree in most Queensland scrubs, having a large quantity of beautifully marked dark heart; *Siphonodon australe*, another scrub tree whose wood is nearly white, very much resembling ivory when polished; the bean-tree (*Castanospermum australe*), growing a heartwood somewhat resembling walnut, but apt to warp in seasoning; the Queensland ebony (*Bauhinia Hookeri*), a rich-coloured hardwood, very suitable for veneering; the scrub sandalwood (*Exocarpus latifolius*); the Australian olive (*Olea paniculata*); and many species of acacias, commonly called myalls or wattles, and remarkable for their rose-like fragrance.

Handsome woods are produced by the "dead finish" (*Albizzia basaltica*), *Acanescens*, *Archidendron Vaillantii*, several of the genera *Terminalia*, *Maba*, *Grevillea*, *Hakea*, *Xylomelum*, *Stenocarpus* and *Banksia*, the timber of the last five being known as beefwood; the silky oak; the Gulf country gutta-percha (*Excæcaria parvifolia*) is very prettily marked and conspicuous for its beauty; and the thready-barked oak (*Casuarina inophloia*).

Tanning Barks.—Many of the indigenous plants are known to be rich in tannin, but only a few of the barks are collected for use, and these are almost entirely confined to the various acacias, one kind (*Acacia decurrens*) being the most extensively used, though it is quite certain that several other species yield barks equally rich in this valuable property. Several of the Eucalypts are used, but not to any extent. The barks of the mangrove—which trees are so abundant along the coasts—have been used in India and elsewhere for tanning, though the trees in Queensland have never been barked for this purpose

CEMENT INDUSTRY IN SAN FRANCISCO.

In his report on the trade, &c., of the district of San Francisco for the year 1900 Mr. Acting Consul-General W. Moore says:—
The following table shows the quantity of cement imported during the last two years:—

From—	Quantity.	
	1900. Lbs.	1899. Lbs.
Belgium	122,182,290	59,234,000
Germany	75,412,551	27,005,200
United Kingdom . .	69,442,000	37,541,000
China	2,964,146	—
Japan	981,200	—
Total	270,982,187	123,780,200

Importations were unusually heavy in 1900, the amount received being more than double that of the year preceding. A large and fairly satisfactory business was done for the first six months, but afterwards prices declined owing to the heavy arrivals and the competition of domestic producers. The stock in hand at the close of the year was very large, and, added to that contracted for and on the way, is quite sufficient for a year's requirements. Prices closed irregular, concessions having to be made to induce buyers to transact business.

Not many years ago British cement had almost a complete monopoly of this market, but last year the importations fell from second to third place, as may be seen by reference to the table. This state of affairs is attributed to the manufacturers, who refused to regard the advice and warnings of importers who urged them to produce a finer article, which they neglected to do until the continental makers had firmly established them-

selves in the business. The British cement now sent here meets the requirements in quality and price, as compared with the continental article, but has lost the prestige that it formerly held, and no longer commands the sale it used to enjoy.

The competition that was threatened by the Chinese and Japanese manufacturers did not turn out of a serious nature, only a small amount having been received from those countries. These imports are sent here by steamer, while the cement from Europe comes by sailing vessels, and the difference in the cost of transportation is said to offset the advantages they possess in cheapness of production. Competition of a more serious character has arisen through the manufacturers of the State of Utah, who are forwarding consignments to this market on a large scale, and recently secured a contract of 10,000 bags in competition with the agents of European brands. They have since secured several contracts from the United States naval and military authorities at a price of 2 dols. 35 c. (9s 8d.) per bag (a bag contains 380 lbs., and is equivalent to the contents of a barrel), laid down where the work is proceeding, and although some prejudice exists against this mode of packing no serious complaints have arisen. All the cement that came in during the last six months of 1900 and that which has arrived since shows a serious loss, as with present prices and rates of freight the European article cannot be landed here for less than 2 dols. 60 c. (10s 8½d.) to 2 dols 75 c. (11s. 4d.) per barrel.

Several local companies for the manufacture of cement have been incorporated, and one of them, possessing extensive properties at the town of Tesla and backed by large capital, is expected to commence operations by the end of the current year. Those that can produce a good article and are situated within a radius of 50 miles from this city have excellent prospects of success, as the transportation charges will not preclude the consignment of their product to this market. Some of the conservative business men here express the opinion that the entire needs of the State will be supplied from local sources in the near future.

LIVERPOOL DOCKS.

THE annual report by Mr. Anthony G. Lyster, engineer to the Mersey Docks and Harbour Board, on the general state and progress of the dock works at Liverpool has been issued. It shows that large and important works have been carried out

during the year, and that several extensions are still in progress. Reference is made to the completion of the new tobacco warehouses at Stanley Dock, the largest of their kind in the world, having fourteen floors, with an aggregate area of 36 acres, and capable of storing 60,000 hogsheads. Some interesting figures are given in the report regarding the dredging work done at the bar and in the channels leading therefrom to Liverpool. The quantity of sand removed during the year amounted to nearly 9,000,000 tons, the result being that the condition of the bar and the channels have been fairly maintained. In conclusion, the report states that the amount of work carried out under the control of the engineer's department has been exceptionally large during the year. The wages bill has at times been within a few pounds of 11,500*l.* per week, and the number of men employed has been upwards of 7,800 at one time. These figures, it is pointed out, are exclusive of payments to contractors, and do not include the men employed by them. The total expenditure in the engineer's department for the year has been 1,230,949*l.*

THE CONDITION OF MARSEILLES.

FROM the report of the British Consul at Marseilles there is much of public interest to be said as to the improvements in public health of this town in recent years, which, judging by the strange comments on Marseilles from time to time in the Press, are apparently ignored. The Marseilles of 1901 is very far from being the Marseilles of ten or even five years ago. Yachts visiting the old port need no longer fear noisome emanations from polluted water and stagnant drains, for the drains of the town no longer empty themselves in the old port, as they still do at Toulon.

In 1898 the great drainage works of Marseilles on the "Tout à l'égout" system were completed, and the drains of the city are carried miles away to sea. Every house is fitted with the modern sanitary arrangements on the flush system. The town is, in fact, the best drained town and the most healthy of all the Mediterranean trading ports. The adoption of this drainage system was made possible by the completion of the Durance Canal, which brings the water of that river across a range of granite mountains to Marseilles and to its once arid suburbs. Marseilles is really little known to the traveller flying through from dock to station, who only sees the busy

docks, the miles of streets, the wonderful "Cannebière," the great street through which everything passes, where natives of every part of the world meet and wonder at each other, and of which the enthusiastic Marseillais is supposed to say, "If Paris had the 'Cannebière,' Paris would be a little Marseilles." The Corniche, the Prado (a boulevard with six rows of trees extending for miles into the country), the sea promenade, the parks, the racecourse, are all to the south of the city, and make the town pleasant to live in. It must be confessed that street cleaning requires much improvement, and that police protection is inadequate for so large a town. On the other hand, it should be acknowledged that the drainage improvements have cost millions of money, and that further improvements, recognised as necessary, are only postponed for want of funds. Reclaiming the poor quarters of the town is in progress—"Rome was not built in a day."

REGISTRATION OF PLUMBERS.

IN connection with the West Lancashire, Cheshire and North Wales District Council of the National Registration of Plumbers, a public distribution of certificates to sanitary plumbers took place at the Liverpool Free Library, William Brown Street. Dr. Vacher, medical officer of health for Cheshire, presided over a large attendance, and was supported, amongst others, by the mayor of Stockton-on-Tees (Alderman Hind), warden of the Worshipful Company of Plumbers. The objects of the National Registration are to raise the standard of efficiency in sanitary plumbing, and to establish a list of registered plumbers for public use. In fulfilment of these aims examinations for masters and operatives in sanitary plumbing are conducted by the West Lancashire, Cheshire and North Wales Council, under the auspices of the Worshipful Company of Plumbers, London, and on Saturday 190 certificates of registration were presented.

Dr. Vacher congratulated the Society upon its successful operations, and emphasised the great importance of sanitary plumbing in the interests of the public health. Alderman Hind, proposed a resolution cordially approving of the national registration of plumbers as a safeguard against ill-health, and advocating the necessity of Parliament being urged, by memorial or otherwise, to deal with the subject during the next session. He asserted that both at home and abroad the demand for good sanitary plumbing was greatly on the increase,

and the importance of the registration of plumbers was being evidenced to a corresponding degree. They wanted plumbers to be registered, so that people would know who were *bona fide* sanitary plumbers and who were quacks, so to speak. It was their earnest desire to see the day ere long when architects would state in their plumbers' specifications that only registered plumbers need apply. They had great hopes that a Bill dealing with the subject of registration would be passed next year.

Mr. T. Fallows, of Bootle, seconded the resolution, and it was unanimously adopted.

THE HOUSING PROBLEM.

BOURNVILLE is to be the scene of an interesting conference on September 21 next. The Garden City Association, one of the objects of which is to induce manufacturers to remove from large and crowded centres to country districts, and whose general aim is to assist in counteracting the evils of overcrowding in towns and depopulation in rural districts, proposes to organise a meeting of representative citizens for the purpose of discussing the housing problem from various points of view, but with special relation to the industrial aspect of the question. Mr. Ralph Neville, K.C., will read a paper on "Co-operation in Garden City."

We believe, says the *Birmingham Daily Post*, that such a conference as is to be promoted by the Garden City Association will help in educating public opinion on this vital question, and the authorities who are to speak on the relation which exists between the various social problems and the projected city will probably have something of importance to say. A great concrete example such as is proposed by this Association to be carried out on land, first of all, we presume, in the vicinity of London, will be a remarkable opportunity for illustrating how the problems associated with land tenure, the liquor traffic, the housing, education, the relations between capital and labour and sanitation may be effectively solved.

But there can be no doubt that, however theoretically perfect the scheme may be, its ultimate success will depend as much on the practical management brought to bear upon details as upon the principle underlying it.

The Bournville experiment is an example of what one manufacturer may do to raise to a higher level the social and material welfare of the people which he has under his care.

But in such a case the experiment can scarcely grow from a village into a town, and there can be no doubt that the social attractions of a village, even when benefiting from such philanthropy, are not sufficient to stem the tide of rural depopulation.

The experiment to be effective in this way, and also to have any appreciable result in towns, must not be a single-handed one, but must be organised and developed on extensive lines. We are glad to observe that under the auspices of the Garden City movement there will be no interference with the rights of private property in carrying out their ideas. They propose to acquire land in a perfectly constitutional manner, at a price which they can secure it for in the open market, and having done so, they intend, quite fairly, to retain for the benefit of the community any future increment of value which that land may acquire. It is calculated that upon an estate of 6,000 acres one-sixth will suffice for the accommodation of a population of 33,000 people, and that the ground rents would provide for the interest at the rate of not less than 4% per annum on the capital and leave a large surplus.

They claim for their proposals:—

1. That they recognise the impossibility of diverting labour by artificial means from the industries to which it flows by the natural operation of economic law.

2. That they bring the producer and consumer of agricultural produce into contact.

3. That the scheme has a sound financial basis resting upon the increase in the value of land caused by an influx of population.

4. That the economies in regard to construction, supply of power, transit, &c., resulting from the construction of a town, in conformity with a premeditated plan, are great.

5. That no economic law is infringed and no industry interfered with. If the scheme can be carried out the ultimate benefit to the population of the country would be great. If it fails, the loss will be measured by the difference between the purchase and sale price of the estate and the cost of partly laying-out a single section of the proposed town.

There can be no doubt that should lands be secured within a reasonable distance of London at the price anticipated, namely, 40% an acre, that the scheme might be made financially successful. We understand that the manufacturers can be got to migrate, and of course that being so the population will follow. As to increase in land value, this may be judged from the fact that Bournville leaseholders pay equal

to 600*l.* per acre, and yet are able to have 600 square yards of garden ground. Rents to weekly tenants on Bournville estate, where land is of the above value, are as low as 5*s.* 3*d.* for a cottage and garden. There is obviously a sufficiently large margin between 40*l.* per acre and 600*l.* to admit of the construction of roads, the supply of public services and interest on the capital expenditure. And yet 600*l.* per acre is about a tenth part of what most manufacturers have to pay for sites in London. When the necessary generating force is available, and the courage of the promoters receives sufficient backing from the public-spirited men and women who desire to see a satisfactory solution of the housing problem and of the problem of the relations between employer and employé, we have no doubt the Garden City Association will realise its ideal.

DWELLINGS FOR THE WORKING CLASSES.

In the section for Municipal and Parliamentary Hygiene at the Eastbourne Congress Bailie Steele, of Glasgow, gave an account of what had been done in Glasgow in connection with the erection of improved and healthy dwellings for the working classes. He explained that the Corporation of Glasgow, seeing the importance of the subject of decently housing the poor of the city, appointed a committee to obtain a large area and erect suitable dwellings. At first the scheme met with much opposition, and nothing of consequence was done till 1888, when a large block was begun to the east side of the historic Salt Market. Since then the trustees had vigorously carried on the work of demolishing old and constructing new properties, until the whole of the unbuilt ground had been nearly covered with substantial properties. Owing to the position and high value of the sites many handsome blocks of houses and shops had been erected, the upper floors of which were occupied by the better working classes, but wherever it had been found practicable the providing of ordinary working-class houses had been undertaken. In all 46 blocks of buildings had been constructed. There were 200 shops, 1,445 dwelling-houses, and of the latter 402 were of one apartment, 890 of two apartments, 152 of three apartments, and only 11 were of larger size. The minimum rents were: One-apartment houses, 4*l.* 10*s.* per annum; two-apartment houses, 6*l.* 16*s.*; three-apartment houses, 12*l.* 9*s.*; and the maximum rents were 8*l.* 15*s.*, 14*l.* and 21*l.* respectively per annum. Since then the

Corporation had done other work in the same direction, and had built a Corporation family house to make provision for people of the poorer classes who, through the death of a husband or wife, were left to struggle with the upbringing of a young family. The house was in charge of a husband and wife, and had been very successful. While Glasgow had done much in the direction of providing suitable accommodation for the poorer class of artisans, much yet required to be done, more particularly in supplying suitable houses for the lower-paid working classes at a rent within their moderate means.

The subject of the housing of the poor was also dealt with by Mr. H. Mansfield Robinson, town clerk of Shoreditch, who drew an appalling picture of overcrowding, and the immorality resulting therefrom, in the East End of London. He instanced single tenements in which from six to ten persons resided, in some cases under disgusting conditions. The difficulty which confronted social reformers in this direction, he urged, was the question of the repayment of the debt for the erection of model dwellings, and he expressed the view that a hundred years should be the period.

The discussion which followed largely turned on the question as to whether the building of single rooms should be encouraged, and there was considerable difference of opinion on the point.

Mr. Robinson moved:—"That this Congress records its emphatic protest against the persistent ignoring by the President of the Local Government Board of the unanimous recommendations of London and provincial municipal authorities passed at the Bermondsey Housing Conference of 1898, the Aberdeen and London Congresses of 1900, the Islington and London County Council Conferences of 1901, and by the Municipal Corporations Association in favour of the extension of housing loans to 100 years, the urgent necessity of which is reiterated by this Congress, and that in view of the fact that interest and repayment of housing loans being charged in some municipalities on the rents of the dwellings and falling upon the tenant and not on the ratepayer, the present repayment charge (averaging about one-third of the rent) inflates the same beyond the means of the poorer workers, and thus the efforts of municipal authorities to house them decently are crippled and frustrated."

Sir T. Pile (ex-Lord Mayor of Dublin) seconded the proposition, which was carried.

On the proposition of Alderman Trenner (Holborn), seconded by Mr. Middleton (Aberdeen), the Government

were called upon to adopt and pass immediately the Bill introduced by the Hon. Claude Hay, M.P., Mr. Bull, M.P., and others for securing the extension of housing loans to a minimum period of 100 years, and so assist municipal authorities in palliating without further delay the dreadful evil of overcrowding admitted by the Premier to be a scandal to civilisation.

SEWER VENTILATION.

At the meeting of the Health Congress at Eastbourne a paper was read by Mr. I. Shone on "The House and Town Drainage Systems of the Twentieth Century." He remarked on the fact that twenty-one years ago the first installation of the system of drainage bearing his name was laid at Eastbourne, and he detailed at length the principles of what he described as a sound sanitary, scientific and economical method of drainage. He concluded by exhibiting examples of an improved intercepting trap, &c.

Dr. Willoughby gave some particulars as to the methods of sewer ventilation which had been tried at Eastbourne, and generally abandoned in favour of the ventilating shaft.

The Mayor remarked that the great principle to which Mr. Law had adhered in advising the Eastbourne Corporation relative to their recently constructed system of drainage was that if they had a proper sewer, affording facilities for the regular and constant flow of the sewage, they need trouble themselves very little about ventilation in the street.

Mr. R. M. Gloyne, borough engineer at Eastbourne, observed that it was proposed that afternoon to pay a visit of inspection to the outfall and ejector, the power of which had been lately and materially increased. They had, as the Congress had been informed, tried various systems, some of which had been unsatisfactory, while others had been found too expensive. They were now ventilating by the up-shaft method, and for the erection of these shafts they were glad to have the permission of house owners and householders.

Dr. Newsholme, medical officer of health at Brighton, said he thought that the Mayor of Eastbourne had hit the nail on the head when he remarked that with a properly-constructed sewer they need trouble little about ventilation, the importance of which, he submitted, was greatly exaggerated. There was very little necessity indeed for the elaborate methods which had been brought under their notice that morning. Sewer

ventilation was a question of comfort and of health. The emanation from a well-made sewer did not, he argued, affect health, but as a matter of comfort they desired to get rid of smells, and he thought they had with the ventilating shafts the correct system at Brighton and Eastbourne.

Dr. Weaver, medical officer of health at Stockport, said he had very substantial reasons for regarding sewer gas as very deleterious, cases of typhoid having to his knowledge occurred in the vicinity of a ventilator where the smell had been particularly bad. If sewer gas was not bad for health, why did they often put house owners to the expense of redraining their premises?

The value of the intercepting trap was also debated.

ST. PAUL'S CATHEDRAL.

At St. Paul's Cathedral Mr. E. J. Harding must now have an anxious time in answering the inquiries of newspaper correspondents. In a conversation with the representative of the *Daily News*, he said:—

"The Cathedral is weak, and we feel that there would be great danger in allowing the underground electric Piccadilly railway to come, as is proposed, so close as Carter Lane. It is no new discovery that the Cathedral is weak. Its custodians knew all about that over a century ago, as is proved by the works then undertaken to strengthen the south transept. Iron ties and straps were introduced. Then we have the evidence of weakness that is supplied by numerous cracks in the structure. Those cracks are not new, but there is this significant fact about them—after being filled up they have reopened within the last twenty years."

"Are they very serious fractures?" asked the representative.

"Well, they are not chasms. While the original crack was say, three-quarters of an inch, the new opening would be comparatively small. These cracks, I am sorry to say, are very widespread, and occur at different levels. I have been watching their development for years, and consequently have a tolerably full knowledge of the subject. As that knowledge has now to be embodied in a report, I am about to institute a very thorough scrutiny of the building. As a misapprehension has arisen on the point, I may mention that this scrutiny will not necessitate the erection of scaffolding all over the dome."

"How comes it that the Cathedral is weak?"

"The foundations on the south side were insufficient. Wren did not go deep enough. Where we stand on the crypt level there is a depth of 5 feet of masonry between us and the yellow clay on which the Cathedral stands."

"What! St. Paul's Cathedral has only a 5-feet foundation?"

"That is to put the matter too severely. The crypt, with its many heavy piers, would also count as foundation, and the distance between the crypt floor and the Cathedral floor is 18 feet."

"Still, Sir Christopher should have gone deeper?"

"Yes, on the river side. On the other side the Cathedral is as firm as a rock. When you go 5 or 6 feet through the yellow clay—called by Wren 'potters' earth'—you come to a shifting gravel, containing water, and below that comes another stratum of clay. Now the draining off of the water from the gravel is the cause of the mischief on the south side. By-the-by, I ought to mention that Sir Christopher experienced great difficulty in getting a stable foundation at the north-east of the building, where he finally had to go down about 40 feet."

"What has led to the drainage of water from the sub-soil?"
